N 15084.d

# CONTENTS.

## VOL. XXVII., NEW SERIES. VOL. LXXVIII., OLD SERIES.

## JANUARY TO JUNE, 1879.

A

Abdominal section for intussusception, 180, 186
Aberdeen, capping of medical graduates at, 375
Aberdeen university, 393
Academie de medicine et des science, Paris (see "Transactions of Societies")
Acland, Dr., resignation of, 392, 516
Actonian prize, 91
Adams, Dr., on a case of psoas abscess, 480
Addison, Mr. Adam, sentence on, 452, 453
Addison's disease, 134, 141, 220
Address of vice-president of Surgical Society of Ireland, 348
Adenoid tumours of the naso-pharynx, 263, 302, 323, 361, 401, 421, 442, 461
Adulteration act, 331, 334
Adulteration of drugs, 72, 151, 472
Adulteration in Dublin, 373
Adulteration of essential oils, 12
Adulteration of flour and bread, 66
Advertising "doctor," the end of a, 109
Aerated and mineral water association, 75
Afghanistan expedition, medical staff of the, 387
Alcohol, moderate use of, 230
Alice memorial fund, 90
Alkali acts, the, 71
Alkaline waters of Vals, the, 291
Alleged neglect, 293, 335
Althaus, Dr. Julius, on the pathology of peripheral nervous diseases, 98
Amputation of thigh, 82
Anæsthetics, apparatus for administering, 416
Anæsthesia by the protoxide of azote, 284
Andersonian school of medicine, 52
Anderson's college dispensary, 315
Anderson, Dr. McCall, on Addison's disease, 112, 134, 141
Aneurism, the cure of, 315
Animal intelligence, 375
Anglo-Saxon race, development of the, 391
Annus medicus, 1878, 6
Ante-mortem examination of the brain, 86
Anti-vaccinators, new trick of, 333
Anti-vaccination journal, 313
Anti-vivisectionists, 208, 451
Anus, artificial, after strangulated congenital hernia, 25
Aphasia, 220
Apomorphia as an expectorant, 172
Apothecaries to prisons in Ireland, 104
Apothecaries society v. Shepperley, 14
Apothecaries' weights, 228
Aquafortis, suicide by poisoning with, 108
Arming the Indian medical subordinates, 516
Arsenic in the nursery, 474
Arsenical wall papers, 473
Army, physical competition in, 193
Army medical department, 144, 405
Army medical report, 470
Arts qualifications, the registration of, 252
Ascites complicated with œdema of the scrotum, 199
Asiatic cholera and sunstroke, treatment of, 237
Asthma, 57, 77, 137, 177, 197, 239, 305, 312
Atthill, Dr., a case of large calculus in the female bladder, 60; cases of ovariotomy, 118

B

Baker, W. M., on india-rubber tracheotomy tubes, 396
Bank holidays, 474
Barnes, Mr., on liquid ext. of red gum, 519
Barrington's hospital, Limerick, 152
Belladonna, 353
Berkart, Dr. J. B., on the pathology and treatment of asthma, 305
Biliary calculus, 382
Biological society of Paris (see "Transactions of Societies")
Birth in the streets, 111
Black, Dr. C., on calculus in the female bladder, 161
Bladder, operation for stone in, by Mr. Teevan, 17
Bladder, papilloma of the, 384
Blister, an improved, 313
Bloodletting, M. Chauffard on, 106
Bloodletting, by Dr. Johnson, 242
Bloodletting, 273, 291
Bogus diplomas, 390
Borax as a meat preserver, 32
Brain, injury of, 333, 381
Brereton, Mr. W. W., on local fixation during operations, 219
British dental association, 203, 212
British hospital in Paris, 335
British medical association, visit to Ireland, 332
Broadmoor criminal lunatic asylum, 11
Bronchitis kettle, an improved, 113
Brown bread v. white, 192
Bryant's practice of surgery, 375
Bubo, abortive treatment of, 292
Buried alive, the fear of being, 492
Burnet, R. W. D., report of cases in London hospital, 424
Burning an hospital ambulance, 110

C

Cæsarian operation, 183
Cæsarian operation in Rome, 453
Calabar beans, false, 312
Calculus in the female bladder, 60, 161
Cambridge university, 15
Cancer of the breast, 123
Carmichael prize essays the, 332, 377
Capital punishment, 12
Catholic medical journal, a, 473
Caries of the bone of the foot, 158, 164
Caries of os calcis and astragalus, 282
Castor-oil pills, 292
Cerebral atrophy, 426
Cerebral syphilisation, 404
Centenarian, an Irish, 32, 434
Charcot, Professor, lectures on the lungs, 1, 22, 37, 139, 157
Charing-cross hospital, 156
Change of life, 419, 481
Chemist's time, value of, 170
Chloral in migraine, 229, 315
Cholera, immunity from, 71
Chloroform, impurities and dangers of, 109
Chloroform in disease of the heart, 91
Chronic intermittent albuminuria, 67
Chorea, the nature and treatment of, 379, 400
Chloroform administered to children, 412
Charitable bequests, 473
Cigars, fifteen a day, 95
Cinchona cultivation in India, 516
Clarke, Dr. A., notes of cases in London hospital, 424
Clinical society of London (see "Transactions of Societies")

## CLINICAL LECTURES.

Brain injury, by A. T. Norton, 239
Catarrhal ophthalmia 97; Chemical injury to the surface of the eye with quicklime, destruction of the eye, by Mr. Haynes Walton, 117
Lettsomian Lectures—I. Bronchial asthma, its history and nature. II. Bronchial congestion, and pathological relations of asthma. III. Treatment of asthma, by John C. Thorowgood, 57, 77, 137, 177, 197, 237
Pathological Anatomy of the lungs, by Prof. Charcot, 1, 22, 87, 139, 157

## CLINICAL RECORDS.

On the resuscitation of newly-born infants, by Dr. G. de G. Griffith, 4
A visit to the surgical wards of Mercer's hospital on New Year's day, 24
St. Peter's Hospital—Stone in the bladder of an old man, lithotrity, erysipelas, death; stone in the bladder, lithotomy, recovery, under the care of Mr. Teevan, 40, 245
Case of diphtheria in which the pulse was dicrotic, by Dr. Hermann Lowi, of Vienna, 62
Mercer's Hospital, Dublin—Cases under the care of Mr. E. S. O'Grady, 82, 201, 364, 506
Notes on a few cases of phagedæna in the Female Lock hospital, London, under the care of Mr. Buxton Shillitoe, 122
St. Mary's Hospital—Laceration of hand, sloughing into wrist-joint, amputation of the forearm, acute pleuritis five weeks after operation, recovery, under the care of Mr. A. T. Norton, 143
Calculus in the female bladder, by Dr. Campbell Black, 161
Hopital Laribo sière, Paris—Intraperitoneal hæmorrhage in a woman pregnant eight-and-a-half months, sudden death, Cæsarian operation, extraction of a living child, 183

Caution in the use of vaseline and similar petroleum derivatives, by W. Fraser, 344
Hopital du Midi, Paris—Amblyopia, symptomatic of cerebral syphilisation, by M. Charles Mauriac, 404
London Hospital—Notes of cases, by Dr. Andrew Clark, 424

Cod-liver oil, assimilation of, 312
Coffee, physiological action of, 109
College of Physicians, London, 150, 192
College of Physicians in Ireland, 75
College of Surgeons, Ireland, 136, 156, 170, 172, 194, 212, 215, 391, 392, 438, 492
College of Surgeons, England, 95, 106, 438, 498, 521
College of science, Dublin, 415
Colotomy, 201
Conjoint scheme, 147
Contagious diseases acts, the, 48, 174, 341, 346, 354, 413, 415, 494, 497, 519
Contagious diseases, mortality from, 70
Coombe hospital, 335
Convalescent sea-side homes, 413
Constitutional varieties of races, 107
Corley, Mr A. H., on abdominal section for intussusception, 180, 187
Coroners' inquests, liability of hospital surgeons to give evidence at, 49
Coroners and post-mortem examinations, 72
Coroners (Irish) grievances of, 352
Coroners, the Irish, 352
Coroners' bill, the proposed, 391

## CORRESPONDENCE.

The Society of Apothecaries v. Shepperley, 14
Private lunatic asylums, 15
Society for total abolition of vivisection, 15
The vaccination system, 34
Unqualified practice, 53
Moderate drinking, 54
Vaccinatton and re-vaccination, 55
Medical advertising eighty years ago, 74
Disqualification of voters by medical relief, 94
Life insurance queries, 94
Vaccination, 94
How to live on sixpence a day, 94
Fifteen cigars a day, 95
A modification of the duckbill speculum, 112
The Dublin public health job, 112
Milk transfusion, 113, 135
Dr. McCall Anderson on Addison's disease, 134
Poor-law medical superannuation, 135
Alleged failure of the contagious diseases acts, 174
Internal medical reforms, 215
Vaccine lymph and the death-rate, 215
Surgeon Reynolds, 236
Treatment of Asiatic cholera and sunstroke, 237
"Homœopathy gone mad," 256
The herbalists and their parliamentary apologists, 256
Dispensary statistics, 257
The Indian medical service, 276
The Irish vaccination amendment bill, 276
St. John ambulance association, 276
Harvey memorial fund, 277
Medical acts amendment bill, 277
An apothecary guessed to have been poisoned, 295
A dispensary doctor's will, 295
Treatment of post-partum hœmorrhage, 295
On the unity of poison in scarlatina, puerperal fever, typhoid, diphtheria, erysipelas, 315, 396
The prolonged and continuous use of chloral, 315
Croup and diphtheria, 395, 455, 476, 496
Mania and necrosis, 396
India-rubber tracheotomy tubes, 396
Danger of injecting the uterus with perchloride of iron, 415
The contagious diseases acts, 415
The use of emetics in parturition, 436
Uses of ipecacuanha in uterine hæmorrhage, 455
Medical titles, 476
Professional communications to lay papers, 477, 496
Contagions diseases acts, 494
Contiguity of neuro-retinitis with descending retinitis from intra cerebral disease, 519
Liq. ext. of red gum, 519
Propagation of contagious diseases, 519
Aids in forceps delivery, 520
The title of physicians, 520

Copland, Mr. J. C., on periodical hæmoglobinuria—(translation) 39
Corns and their treatment, 292
Counter prescribers protection, 230
Cranium holder, new form of, 262
Cremation, 86, 243, 289, 390, 472
Criminal lunatic asylum, 11
Crofton, Mr. D., on the fumes of burning nitre paper in asthma, 283
Croup and diphtheria, 309, 367, 369, 385, 395, 426, 429, 441, 455, 475, 496, 518
Curatorship of the Royal College of Surgeons, Ireland, 497
Cystotomy, 266

## D

Day, Dr. W. H., on some heart diseases in children, 299, 319; on the nature and treatment of chorea, 379, 399
Death of an apothecary, 229
Dental association, the British, 203, 212
Dental hospital for Dublin, a new, 274
Dental license of the Irish College of Surgeons, 212
Dental mob, the, 105
Diarrhœa, summer, 171
Digestion, recent researches on, 335
Dillwyn's, Mr., lunacy bill, 349
Diphtheria in Germany, 13
Diphtheria, salicylic acid in, 16
Diphtheria, in which the pulse was dicrotic, a case of, 62
Diphtheria, treatment of by large doses of calomel, 107
Diphtheria and croup, 309, 367, 385, 395, 426, 429, 441, 455, 475, 496, 503, 518
Diphtheria, origin of in diseased milk, 45
Diphtheria, tracheotomy in, 202
Dislocation of the forearm, 325
Dislocations, notes on the reduction of, 81
Dispensary election, an Irish, 210
Dispensary houses (Ireland) bill, 354
Dispensary statistics, 257
Dispensary veteran, a, 152
Disqualification of voters by medical relief, 94
Doctors, co-operation, and advertising, 374
Dodwell, the rev. Mr., 43
Donovan, Dr., on the vaccination system, 34
Dowse, Dr., on nervous affections of the skin, 499
Drugs, adulteration of, 151, 472
Drug contracts for Irish workhouses, 227, 374
Drug smoking, 371
Drunkards, habitual, 103
Dublin medical wills, 195
Dublin university, 15
Duckbill speculum, 112
Duke, Dr. A., new tractor for midwifery forceps, 378; on aids in forceps delivery, 520
Dysentery, a new remedy for, 314

## E

Ear disease, on the general pathology of, 241, 259
Eczema, 272
Edinburgh royal Infirmary, 92, 195, 356
Edinburgh royal maternity, 294, 375
Edinburgh university, 52, 92, 133, 213, 294, 315, 375
Effects of publicity on suicide, 13
Effect of varnishing the skin of animals, 11
Ekowe, the sick at, 411
Election of council Royal College of Surgeons, 391
Electric light, surgery under, 245
Emetics in parturition, 436
Epidemic diseases, 226
Epidemiological Society of Great Britain (see "Transactions of Societies")
Epilepsy, partial, 326
Essential oils, adulteration of, 12
Ether inhalation, 521
Examinership in the Irish College of Surgeons, 392
Excision of the elbow-joint, 180, 186
Experience of an Irish poor-law medical officer, 502
Extraordinary birth, 109
Eye, injury to with quicklime, 117

## F

False certificates of death, 514
Famine in India, 329
Fibro-gelatinous polypus, 222
Fibroma removed from the back of a man, 218
Field, Mr. G. P., on the general pathology of ear disease, 241, 259
First Ophthalmological Society of Heidelberg, 5
Fleming testimonial, the, 471
Flour and plaster case, the, 133
Food and Drugs Bill, 372
Fracture of the patella, by Mr. Wheeler, 20
Fracture, rare specimen of, 163
Frauds upon a Dublin hospital, 194
Frazer, Mr. W., on the use of vaseline, 344
French costume under the revolution, 411
French doctor, the political, 71
Frozen bodies for demonstration and examination, 108

## G

Gant, Mr., on the science and practice of surgery, 33, 235
Gas-light, influence of, on the eyes, 108
Gayer, Surgeon-Major, obituary of, 113
General Medical Council, 31, 151, 155, 211, 224, 251, 253, 287, 516
Genu valgum, a case of, 447
Genu valgum, 159, 164
German Surgical Society, the eighth congress of, 292
Glanders, death from, 333, 372
Glasgow Convalescent Home, 93
Glasgow Blind Asylum, 92
Glasgow Lock Hospital, 74
Glasgow Maternity, 356
"Glasgow Medical Journal," 74, 134
Glasgow Medico-Chirurgical Society, 111, 134, 276
Glasgow Philosophical Society, 134, 328
Glasgow Royal Asylum for Lunatics, 86
Glasgow Royal Infirmary, 112
Gluttony, 392
Goodhart, Dr., on a case of hysteria with vomiting, 284
Graham lectures, the, 92
Grand jury bill, the Irish, 508
Gratuitous attendance on gentlemen's servants, 50
Greenock Infirmary, 74
Greenock Poor-house, 455
Griffith, Dr., on the resuscitation of newly-born infants, 4
Griffith, Dr., on puerperal fever, 80, 262
Griffiths, Dr., on the unity of poison in fevers, 396
Guerder, Dr., otology of the last ten years, 61
Guess verdicts at inquests, 317
Guy's Hospital (see "Clinical Records")
Gynæcology in lunatic asylums, 426
Gynæcological fact, a double, 312
Gynæcological museum for Manchester, 411

## H

Habitua Drunkards Bill, 391, 415, 426

Hæmorrhage, assigned to iodide of potassium, 314
Hæmorrhage, treatment of, 273
Hæmorrhage in a pregnant woman, 183
Half pint, what is it? 434
Hamilton, Dr. F. H., on dislocation of the fore-arm, 325
Hardy, Prof., on diphtheritic paralyses, 482, 502
Harveian Society, conversazione, 20
Harvey memorial Fund, 279
Health of great cities, 473
Heart disease, a case of, by Dr. Moore, 3
Heart, congenital malformation of, 308
Heart diseases in children, 299, 319
Hemming, Mr. W. D., the otology of the last ten years (Translation), 61; on diphtheritic paralysis, 482, 502
Hepatic abscess, puncture of, 107
Herbalists and their Parliamentary apologists, 229, 256, 273
Herniotomy, impossibility of reduction, 420
Hill, Mr. on the management and diseases of the dog, 14
Hillary, Mr. M., remarks on some injuries of the brain, 381
Hillary, Mr. M., on the capillary circulation of the negro, 400
Hip-joint, amputation at, 326
Hippophagy, 92
Homœopathic confectionary, 434
Homœopathists and the plague, 312
Homœopathy gone mad, 256
Home hospitals, 170
Hôpital du Midi, Paris (see "Clinical Records")
Hospital reform, 268
Hospital Sunday collections in Liverpool, 474
Hospital Sunday fund in Dublin, 129
Hospital Sunday fund in London, 210, 490
Hospitals, their uses and abuses, 249
How to live on sixpence a day, 94
Hunterian oration, 167, 193
Hunterian Society, 156
Hutchinson, Prof., on neuro-pathogenesis, 485, 507
Hydrophobia in Lancashire, 483
Hygiene, the Parkes' museum of, 433
Hygiene and public health, 435
Hysteria with vomiting, 284

I

Ichthyosis, a case of, 345

ILLUSTRATIONS.

Diagram of the digestive canal of a chicken, 37
The duck-bill speculum, 112
Brereton's surgical vice, 212
Surgery under the electric light, 245
New form of cranium holder, 262
Improved sphygmograph, 296
Instrument for fastening metallic sutures, 316
A new vaporiser, 316
Diagram of the heart and lungs, 301
New tractors for midwifery forceps, 378
Apparatus for the administration of anæsthetics, 416
An intra-uterine saw, 477
An improved suspensory bandage, 521

Imperforate rectum, 448
Indian Medical Service, 136, 195, 27
Inebriety, peculiarities of, 426
Infirmaries, Irish county, 151, 156, 267
Infantile paralysis, 447
Infants, prolapse of rectum in, 12
Infant, the largest, on record, 353
Infinitesimalism gone mad, 90
Inhaler, Robson's, 113
Insane poor and their food, 410
Insane, the care of, 285
Intestinal obstruction, 162, 163, 201
Intra-uterine fracture, 160, 165
Ipecacuanha in uterine hæmorrhage, 409, 455

J

Jackson, Dr., remarks on the use of the ophthalmoscope, 439, 459, 479
Jacob, Dr., translations by, 5, 44, 65
James, Dr., remarks on croup and diphtheria, 441, 518
Jesse, Mr., on Society for Total Abolition of Vivisection, 15
Jervis Street Hospital, Dublin, 194
Johnson, Dr. Z., on blood-letting, 242
Jones, Professor H. M., on the treatment of adenoid tumours of the naso-pharynx, 263, 302, 323, 361, 401, 421, 442, 461
Juvenile parturition, 91

K

Kelly, Dr. B., on the identity of croup and diphtheria, 395
Kelly, Dr. B., on the use of emetics in parturition, 436
Kelly, Mr., notes on the reduction of certain dislocations, 81
Kennedy, Dr. H. on the effects which change of position makes on bruit de souffle, 217
Kew Gardens, 210, 231
Kilgariff, Mr. M., on a case of genu-valgum, 169
Killed in the streets, 192, 230
King and Queen's College of Physicians in Ireland, 75
Knee-joint, certain diseases of, 322
Knowledge of high places, 294

L

Lady doctors, 422
Laparatomy, 445
Larynx, fracture of the, 123
Latin in prescriptions, 434
Latrine accommodation, 513
Layton, Mr., on the Society of Apothecaries v. Shepperley, 14

A COURSE OF

# Clinical Lectures

ON THE

## PATHOLOGICAL ANATOMY OF THE LUNGS.

By Professor CHARCOT,

Physician to the Salpêtrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

(*Continued from last vol., page* 514.)

### IV. THE PULMONARY EPITHELIUM (*continued*).

WHEN terminating in our last lecture the description of the epithelial pulmonary investment considered under normal conditions in man during the course of extra-uterine life, I made the remark that this investment, composed of a single layer of flat cells placed in juxtaposition and joined to one another, may be confounded morphologically with the endotheliums, which cover the serous membranes, the walls of the blood-vessels and lymphatics, &c. A character common to these endotheliums, of which the pulmonary epithelium reproduces the morphological type is, as you know, to develope itself in the embryo at the expense of the middle blastodermic leaf, whilst the epitheliums, properly so-called, arise from the internal and external leaves. Now, according to His, the author of well-known works on embryogeny, and some observers who have developed the views which he put forth on this subject, a fundamental distinction is established between the epitheliums, properly so-called, and the endotheliums separated from them, you see, by the seats of their development. These should be assimilated to the flat cells of the connective tissue, of which they represent only a modification in form possessing all their physiological properties. They have not, apart from some resemblance, anything in common with the epitheliums, and these two classes of tissue preserve their autonomy and their reciprocal independence in the various circumstances of extra-uterine life with respect to the phenomena of growth, regeneration, and neoplasmic formations. So, according to M. Waldeyer, a strong partisan in pathology of the doctrine of His, connective tissue can never be developed pathologically at the expense of the epithelial tissue, and, inversely, a connective or endothelial cell can never reproduce an epithelial cell; to cite one example with regard to epithelial tissue, the cells of carcinoma or of epithelioma—this follows from this doctrine—should be produced always in the midst of, or the immediate neighbourhood of, an epithelial investment; if a carcinomatous or epithelial tumour is met with in the midst of connective tissue, it is a foreign metastatic production, a secondary centre, the germ of which comes from elsewhere. I shall carefully refrain from entering on the debate excited by this doctrine, because it does not directly concern the special object of our actual studies. I wish to limit myself here to stating that the case of the pulmonary epithelium may be considered as forming an exception to the rule which some would lay down too absolutely. Whilst, on the one hand, in direct continuity with the bronchial epithelial investment, it reproduces the form of the endotheliums; on the other hand, under the action of pathological causes, it behaves as much after the manner of the endotheliums developed at the expense of the middle leaf, as after the manner of epitheliums properly so-called, of all the physiological and morphological characters of which it partakes under certain circumstances at once. This is a point of view at which, perhaps, it will not be inopportune to stay an instant; it will be an occasion for us to show you a sort of sketch of the general pathological anatomy of the pulmonary epithelium, and to justify at the same time an assertion which I made in our last lecture—namely, that the lesions of these elements occupy an important place in the pathological anatomy of the lung.

II. I must first recall briefly to your mind some details of elementary embryogeny, which we shall utilise

further on. I show you a diagram which represents a section perpendicular to the spinal axis, through the middle of an embryo chick fifty-six hours after incubation. The principal details of development are at this time well marked. Here are the external leaf or epiblast, the former serous leaf, and the internal leaf or hypoblast. The middle or mesoblast is divided at this time into two secondary leaves—the somato-pleura and the splanchno-pleura, leaving between them the pleuro-peritoneal cavity.

A word with regard to that which specially concerns us—the development of the lungs. At first, the two lungs are, as you know, buddings or prolongations of the œsophagus. On the third day, from each side of this part of the digestive fold (Fig. 13), may be seen, on dissection, two prolongations or diverticula which answer to each lung. These prolongations, like the digestive tube itself, are composed essentially of two distinct parts: 1. A layer of *hypoblastic* cells, having the character of a cylindrical epithelial investment. 2. A thick layer of *mesoblastic* tissue. The culs-de-sac branch, and push prolongations in the midst of the mesoblast, terminating in small swellings. These last correspond with the alveolar canals and alveoli, the others to the bronchial tubes.

FIG. 13.

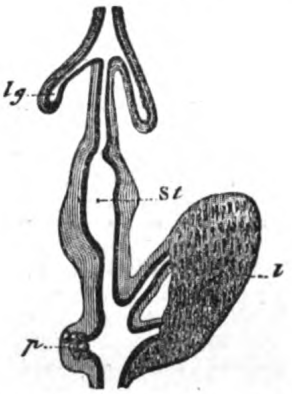

Diagram of a portion of the digestive canal of a chicken at the fourth day. The internal black line represents the hypoblast, the outer lighter part the mesoblast. *lg*, Pulmonary diverticulum, presenting a terminal swollen extremity, forming the primitive pulmonary vesicle. *S t* Stomach. *l* Two hepatic diverticula, the terminal extremities of which are united by uninterrupted rows of hypoblastic cells. *p* Pancreatic and vesicular diverticula. (Foster and Balfour).

Whilst the hypoblastic cells form an investment over the whole extent of surface of these cavities, the mesoblast gives origin to the elastic, muscular, cartilaginous, and connective tissues, &c., which enter into the formation of the aerial canals. Vessels penetrate there about the twentieth day.

We shall soon come to the application of these elementary notions; I shall, indeed, draw from them a demonstration of one of these propositions which I recently laid down—namely, that under the influence of certain pathological causes, the pulmonary epithelium behaves itself after the manner of the endotheliums developed from the inner leaf.

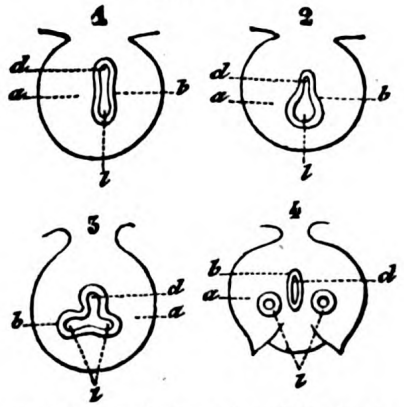
III. There result from this the modifications effected by certain forms of the inflammatory process. In acute inflammations of vascular tissues there are distinguishable two groups of phenomena: Vascular phenomena properly so-called, comprising distension of vessels, migration of leucocytes, formation of exudations. 2. Cellular phenomena relating to a more or less active participation of the pre-existing extra-vascular elements.

The phenomena of this last kind are those which M. Virchow brought to light, but of which he slightly exaggerated the importance. However it may be with this author, it is necessary to distinguish that which he calls, rightly or wrongly, *nutritive irritation*.

This state is characterised by an increase in the cellular element, the protoplasm of which becomes granular (tumefaction trouble), at the same time that certain vital phenomena are manifested, amœboid movements for example.

In other cases, or at a more advanced stage, are produced the phenomena of *formative irritation*. Here the elements tend to multiply, to *proliferate*, and the commonest mode observed in such cases is division by scission. It occurs in the nucleolus first, then in the nucleus, and then in the protoplasm of the cell. A variety of this process is the formation of large cells or plates with nuclei. These are found when the protoplasm does not divide, and there is thus produced one variety of those *giant-cells*, which we shall have to speak about at length when we come to tuberculosis.

FIG. 14.



Four diagrams to show the formation of the lungs. *a*. Mesoblast. *b*. Hypoblast. *d*. Cavity of the digestive canal. *l*. Cavity of the pulmonary diverticulum. In 1, the digestive canal has undergone a strangulation, which separates it into two channels, the one superior, the other inferior; the first is the true alimentary canal, the second the pulmonary tube; they are in communication with one another. In 2, the inferior (pulmonary) tube is the larger. In 3, the enlarged portion is divided so as to form two canals, communicating with one another, and both with the digestive canal. In 4, they are completely separated from one another, as well as from the digestive tube; the mesoblast has also begun to show signs of the internal changes which are produced. (Foster and Balfour).

This mode of multiplication is common in the physiological state, as Remak showed in the case of embryonic development; is also common, as you know, in the pathological state.

These phenomena of proliferation by scission have been studied many times in all their details, *à propos* of inflammation, either experimental or spontaneous, of parts invested with endothelium. I would recall the observations of MM. Cornil and Ranvier on the results of experimental inflammation of the epiploon in adult animals produced by the introduction into the peritoneum of a weak solution of nitrate of silver or tincture of iodine. It is established by these experiments that the endothelial cell first swells, then detaches itself, and undergoes the various phenomena of proliferation by scission. It often forms, under these circumstances, large plates with many nuclei. In man, in peritonitis connected with the puerperal state, M. Kundrat has observed analogous facts. The phenomena are also identical in other serous membranes, whatever be the kind of inflammation, in rheumatic pericarditis, for instance (see Cornil and Ranvier, *loc. cit.*, p. 459, fig. 207). In loose connective tissue, composed, as you know, of fibrillary fasciculi, invested here and there with flat cells, the latter behave, in inflammation, spontaneous or experimental, absolutely in the same fashion as the endothelial cells of serous membranes. I would cite on this point the observations of Ranvier and of Fleming, and those I have made with M. Debove (unpublished course on inflammation in general, 1872). Besides the formation of exudation and the diapedesis of leucocytes, there was seen in all

these cases multiplication by scission of flat cells ending in the formation of embryonic elements, or small round cells. The phenomena of scission are much less manifest if they have ever been clearly observed in pathological conditions. As regards epitheliums, properly so-called, it is not because these epitheliums are not susceptible of showing very active regeneration and multiplication. I will limit myself to citing on this point the result of experiments which I have made with M. Gombault on ligature of the ductus choledochus. We know that beyond the narrowed point this canal then undergoes considerable distension. The cylindrical epithelial investment accommodates itself to these new conditions, and twelve or fifteen days after the operation, we find the wall of the dilated canal uniformly lined with a complete and very regular cylindrical epithelium. There is not a single cell wanting, and they do not appear notably increased in size. We are ignorant at present by what process the enormous multiplication of epithelial cells takes place in such a case ("Lectures on Diseases of the Liver," 1877, pp. 164, 169, 229).

## A CASE OF DISEASE OF THE HEART AND AORTA—AORTIC AND MITRAL INSUFFICIENCY; CHRONIC ENDARTERITIS DEFORMANS; ANGINA PECTORIS. (a)

By J. W. MOORE, M.D., F.K.Q.C.P.,
Physician to the Meath Hospital, Dublin.

Robert C., æt. 50, married, a boot-closer, was admitted to Ward 18 of the Meath Hospital, on March 4, 1878, complaining of cough, difficulty of breathing on slight exertion, impaired vision, swelling about the feet and ankles, and occasional attacks of sharp shooting pain across his chest and down his left arm.

He stated that he had been a strong, hale man until ten or eleven years ago, when he passed through a severe attack of rheumatic fever. Since that time he had become liable to catch cold and was subject to a cough at times, when he would with difficulty get up a white frothy spit. During the past few years he has suffered from occasional paroxysms of sharp pain in his chest and down his left arm. Any excitement brings on this pain, which is agonising. The pain comes on suddenly, lasts about half an hour, or perhaps only twenty minutes, and leaves him very weak. It attacks him by night as well as by day, causing him to wake with a start, and rendering his sleep very uncertain and broken. When the pain comes on, he has to sit up in bed to catch his breath. The sight became impaired soon after the pain began. His breathing was never very good of late years, but he loses it almost entirely now upon slight exertion, such as walking up stairs, &c. About last Christmas he noticed some swelling of the feet and puffiness about his ankles. This increases when he has been sitting up for a time, or when he is attacked by the pain in his chest. His appetite has been fairly good, but he is sometimes troubled with flatulence. The water he passes is generally scanty and high-coloured.

As to his family history, we learned that his father died of fever, a brother of "a pain in his side," at the age of twenty-four. Others of his near relatives succumbed to natural causes. He had been twice married. His first wife was very delicate, her state being for a long time a source of great anxiety to him.

He was a moderate drinker, but used to smoke about a quarter of an ounce of tobacco *per diem*.

(a) Abstract of a Communication made to the Medical Society of Dublin.

Looking casually at him, one would say he was a fine, strong, healthy man, although of a rather pale complexion. He looks younger than he really is, were it not for his baldness, which is extreme. He seems to be a very intelligent man, is of medium height, and weighs 10st. 10lbs. (150 lbs.). At forty years of age, he says he used to weigh exactly 200lbs., but since that time he has been gradually losing flesh—particularly during the past nine months. When admitted his temperature was normal, pulse about 80, and respirations slightly quickened. There was moderate dyspnœa. His tongue was somewhat furred. The face was blanched; there was slight puffiness about the eyes; the left eye seemed weaker than the right, and ran water a little; the right pupil was contracted. The pulse in the radial artery was hard and "hammerstroke" in character. There was visible systolic pulsation in the external carotid, temporal, and femoral arteries, but not to any marked degree in the radial arteries.

*Physical examination* of the chest yielded the following results:—The thorax was in a measure "barrel-shaped." There was fair expansion of both sides. The percussion note over the upper portions of both lungs in front was hyper-resonant; over the bases of both lungs posteriorly it was more or less dull. Feeble vesicular breathing, with various dry râles, were audible in front; muco-crepitus existed behind. There was considerable emphysema of the upper lobes of both lungs, and this led to downward displacement of the liver on the right side and of the heart on the left side. Besides being displaced the liver seemed to be enlarged, for the hepatic dulness extended some distance below the margin of the ribs and occupied the greater portion of the epigastrium. The area of præcordial dulness began as low as the fourth intercostal space, but extended downwards into the epigastrium and the seventh intercostal space. The cardiac impulse was best marked in this interspace one inch to the *left* of the nipple line. It was a strong impulse, unaccompanied by thrill. The area of præcordial dulness just described seemed to depend on (1) displacement of the whole heart downwards, owing to emphysema of the lung; (2) hypertrophy of the left ventricle. That the latter condition was present was evident from (1) the extension of dulness so far to the left; (2) the situation of the apex so low as the seventh intercostal space and so far to the left—the displacement of the apex due to emphysema would be towards the right, or into the epigastrium; and (3) the fact that the impulse was towards the left, forcing out the chest wall towards the infra-axillary region.

At the base of the heart, in the right parasternal line and under the sternum, a double murmur—engaging both sounds—was heard. The second one was clear over the pulmonary area. At the apex a loud systolic murmur existed, which was heard in the axilla and in the left interscapular region.

At this time the urine, although scanty, high-coloured, and turbid from urates, was free from albumen.

The *Diagnosis* was aortic patency, followed by hypertrophy of the left ventricle, mitral insufficiency, chronic bronchial catarrh, pulmonary emphysema, and more or less mechanical congestion of organs. The remote *Prognosis* was very unfavourable.

The *Treatment* consisted in dry-cupping the chest, the administration of diffusible stimulants, digitalis, and liquor strychnia, the application of a belladonna plaster over the heart, local depletion by leeching over right side of heart, and attention to the state of the bowels and kidneys.

The notes were taken by Mr. Thomas B. Lingard, the practising pupil in charge of the case.

The patient left the hospital, decidedly relieved, on April 2nd. A fortnight later he was re-admitted, under Dr. Foot's care, with precisely the same train of symptoms, but in an aggravated form. The secondary complications now were: (1) œdema of the lungs, (2) passive hyperæmia of the liver, (3) slight albuminuria, and (4) general anasarca. The œdema of the lungs was evidenced by marked

dulness over both bases, general ronchus, and œdematous sputa with cough. There was considerable anasarca of the lower extremities—the calf measuring fifteen inches. The abdomen was swollen, and he felt "a little swelled all over." Dr. Foot prescribed for him a diuretic mixture, with infusion of digitalis, a diffusible stimulant mixture, and—should angina come on—a draught composed of two minims of nitrite of amyl in an ounce of camphor water.

## A FEW REMARKS ADDRESSED TO YOUNG DISPENSARY DOCTORS.

By An OLD STAGER.

The introduction of vaccine inoculation by Jenner, the earnest zeal of medical men as a body in extending the practice of it, in the face of much opposition, redounds so much to the credit of the profession in the past that it ought to remain a point of honour with all its members to persist in the same course both now and in the future. It should be a point of honour, well paid or inadequately paid, to take due care that it be so performed as to be as effectual as possible; and so I believe it to be with all who have been for any length of time engaged in practice. But young men are not always considerate, nor have many of them ever seen the dire suffering, the loathsome appearances—the much-to-be-lamented results of epidemic small-pox. I think, therefore, that it is not out of the sphere of any senior in the profession to give a word of warning and exhortation on the subject to his juniors.

Every vaccinator should feel bound to choose good, healthy lymph; take it for preservation and transfer on the proper day; and never to be satisfied without trying to attain, as perfect vesicles as possible, in each case. For this purpose he ought to select the cleanest, and most healthy children, from whom to vaccinate. He ought to transfer it, when possible, direct from arm to arm. He should be most careful in using thoroughly clean instruments. I do not attempt to teach how to vaccinate—now so well known—but I append a few points from my own practice which I hope young men may duly consider.

Whatever instrument I use, I make a point of immersing it in boiling water before I begin, and repeat after each vaccination, carefully wiping after each immersion. I am careful not to vaccinate from vesicles round which the areola is well marked; if possible I select one without any areola. I am careful to open the vesicle itself, as lightly as possible, on its most prominent part, as there is often pus about the base, though in perhaps infinitesimal quantity. I am careful to use nothing but the freely-exuding lymph, and if blood appears remove it with a piece of blotting-paper before proceeding further. I am never satisfied with less than three points of vaccination in the arm, the records of the London Small-Pox Hospital showing the value of this, and I draw as little blood as possible from the child being vaccinated, or if, unfortunately, it flow unduly I wait until it ceases to flow before inserting the lymph.

As to the transmission of lymph, I am prejudiced in favour of the old plan of square glasses for supply in this country. If carefully attended to, it is cleanly and easily used. I use the glasses freshly wiped out of boiling water—of course when cooled. I never bring them in contact until the lymph is dry, and paper them up carefully. And here I must say I too often see in dispensaries loaded glasses, looking dusty and dirty, lying over from week to week unpapered; this I look upon as a piece of blameable neglect. Ivory points I dislike; being organic matter they are unsuited for preserving other organic matter for any time with safety, and they are not easy to clean. Capillary tubes answer very well to send vaccine to tropical climates, but are quite unnecessary in this country, where lymph need not be kept longer than a fortnight; besides, they are troublesome, and require some skill to seal them without damaging the contained lymph by the heat employed. I have used lymph from glasses a month and six weeks old, with perfect success.

When using the glasses the mode I adopt is, after my lancet has been dipped in boiling water and wiped to take a small drop of warm water on its point, place it in the lymph, stir to solution, and then use it as if fresh lymph. This is much better than scraping it off, as some do, and trying to place it in the wound to be dissolved by the blood or serum. All this may appear too much care, but such, I maintain, is due to the honour of the profession, and with this view cannot be considered as excessive.

Should eczema set in after vaccination (a rare occurrence with me) I find a few grains of bicarb. potas. three times a day will remove it soon, and with delicate children I always think it well to follow up vaccination with a short course of iron, in any shape convenient.

# Clinical Records.

## ON THE RESUSCITATION OF NEWLY-BORN INFANTS.

By Dr. G. de GORREQUER GRIFFITH,

Senior Physician to the Hospital for Women and Children; Consulting Physician-Accoucheur to St. Saviour's Maternity.

Except by the experienced accoucheur, the power of vitality evinced by the returning to life when it seems even quite extinct, which new-born children manifest, is hardly credible. This power is not, however, confined to the human species, but is shared by the young of the inferior creation; and I have observed that the less completely developed the child may be, the greater seems the amount of this power; or rather, perhaps, the less development, the less the effect of shocks and injuries; owing, no doubt, to the low state of vitality, the appreciation of them is reduced to the minimum, just such a correlative reduction as we see in the drunken man.

In the evening of April 12th, 1877, Mr. Bamber asked me to see a footling case along with him. The patient had previously given birth to nine or ten children. The waters had broken two hours before. Mr. Bamber had only just been called; the patient was weary and fretful, and kept saying she "had never been this way before, but had always had such quick times."

On examining with the finger I found the vagina and cavity of the pelvis large and roomy; I might say, capacious; the os open to about the size of a florin, but dilatable to a greater extent; both feet presenting, one being a little in advance of the other, a loop of the cord being also down between the feet, and through the os; the funis was, moreover, pulseless and cold to the touch. The brim, I ascertained, was *almost* circular, and so narrow in its measurement that it would not allow an ordinary full grown fœtus to pass. I tried, but unavailingly, to return the cord, and finding the child unusually small, I forthwith proceeded to deliver by catching the presenting foot, drawing it down a little, then seizing the other, and having both in my left hand, I used the necessary traction; the os readily gave way, and there was no difficulty till the head had to pass the brim, and though I turned in the relatively correspondent diameters of the pelvis, I feared it would not come through without perforation. However, after using no small detrahent force, I accomplished the delivery. The funis was quite pulseless and cold; the child was also cold; there was no sign of life till I looked at the cardiac region, and there I noticed heart tremblings, hardly worthy the name of pulsations.

Encouraged by this, I squeezed whatever of blood was in the cord into the body of the infant, and by repeating this a few times—thus imitating pulsations—and adopting the usual remedies of resuscitation, I had the satisfaction of seeing it slowly return to life under Mr. Bamber's kind unremitting care.

I should say, that from the time I first examined and

found the cord cold and pulseless to the time the child was completely born, nearly an hour had elapsedthat the little one was only about the size of a six months and a-half child, and seemed imperfectly developed, two conditions which would have made me almost despair of resuscitation had not the mother assured me that all her children had lived though born as small and puny.

I do not remember ever having had an instance such as this come under my notice in any way. I mean where the cord was for so long a time in the state I have described, and also where no respiratory action took place for such a lengthened period, and then life to return; and I record it for the encouragement of those who might otherwise think that, under similar conditions and efforts, attempt at recovery was useless.

Moreover, the traction force on the child's neck was necessarily so great in order to liberate the child's head that I am surprised the child was born alive and uninjured. Indeed, I should not have even attempted such force had the symptoms I have pointed out not existed, and had not life seemed extinct for apparently some time.

### Tenth Session.

*Extract from the "Klinische Monatsblattern für Augentreil Kunde, 1877."*

Translated from the "*Annuales d'Oculistiqne.*"

By ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S.I.,

Sometime Ophthalmic and Aural Surgeon to the City of Dublin Hospital, and Dublin Eye and Ear Infirmary.

(*Continued from page 313, last vol.*)

IV.—H. Schmidt Rimpler.—*Demonstrations of the Decussation of the Optic Nerves.*—The conclusion arrived at in this communication is, that the decussating fibres are more numerous than the others, so that semi-decussation should be taken *cum grano salis.*

*Discussion.*

According to Schön, the different results may be explained by individual differences, as in the case of the decussation of the pyramid, demonstrated by Blessig.

Lainelsohn believes that the doubt arises from the fact that in hemyopia the chiasm alone is taken into consideration, and that according to the examinations of Schweigger and Foster, the seat of decussation should be relegated, in part at least, to the nervous centres, where the nervous fibres are collected into bundles. This is the only manner in which it is possible to explain certain cases.

Königshofer announced that Professor Michel has instituted a series of researches according to the method of Gudden, from which it appears that the decussation is complete.

V.—Hirschberg.—*Change in the Body of the Eye in General Anæmia.*—Edward von Jäger had already demonstrated that general anæmia affects the central vessels of the retina, less than was at first believed. He had, however, met with cases of local anæmia in two series of cases, firstly, after hæmorrhage; secondly, in several cases of anæmia arising from inanition, and especially from exhausting diseases. Experiments made on dogs after copious and repeated blood-letting have been barren in results. In man, on the contrary, typical alterations are met with in advanced anæmia. This is exclusive, however, of hæmorrhage of the retina, and of the white flake plaques, which have been so often described.

The alterations may be placed in three categories: Firstly, the papillæ of both eyes become pale, then clear white, without any shade of blue, the vessels still retaining their normal size. If there be not a complication of central hæmorrhage, or of white flakes, acuteness of vision is retained. If the anæmia be cured, the optic nerve returns to its normal state. These symptoms are found in bad cases of anemia, and in curable anæmia, arising from loss of blood.

Secondly, in chronic, severe, idiopathic, or secondary anæmia, the papilla becomes white and troubled, the reflex striæ of the vessels become indistinct, the vessels themselves contract and become lost towards the periphery.

An appearance of optic neuritis is formed, showing later white striæ very strongly marked. Hæmorrhage of the retina, and white flakes, are also found in this as in the preceding category.

The right is not much affected, and death often occurs without any important change having taken place.

Thirdly, the neuritis appears a few days after exhaustive hæmorrhage. Without any indication of abrupt swelling of the papilla, there radiates from it in all directions, and above the yellow spot, a film of an intense white colour, gradually disappearing in the neighbourhood of the periphery. Red flakes of recent formation stand out boldly on this background of white. The sight is always affected, although apathetic patients do not complain; absolute amaurosis may possibly ensue in a few days. This, whether simple or double, is generally persistent. Death is the general termination.

These cases have already been described by several authors, but observations on them are still rare.

The author also described a case belonging to the third category.

The meeting then adjourned until the afternoon.

### Afternoon Meeting.

I.—Ewald.—*On Optography and the Apparatus required* (pp. 105—109).—The necessary apparatus consists of a box, of which the cover is fixed at the distance of about 25 centim. from the cornea. The rabbit should be kept in darkness for a period of from three to four hours; then, the head being covered with a black cloth, the head removed, the medulla oblongata and the brain being destroyed must be placed in the box, which should be in the open air. The cover is taken off for two or three minutes, according to the clearness of the weather. As object, a piece of dull glass, with designs on black paper, is found under the cover. The eyes are then opened to the light—this should, however, be done without haste—an equatorial incision is made, a slight shake causes the vitreous humour to fall, and the posterior segment of the eye-ball is then placed in water containing 4 per cent. of alum until the next day. The optic nerve may then be removed by means of a punch, and the retina easily detached by means of a forceps. The next process is to place it under a capsule of porcelain, to which it invariably adheres after two slight incisions have been made; these should not, however, pass through the optogram. The whole is then dried in a desiccator over sulphuric acid. In its dried state the optogram offers considerable resistance to the action of light.

Kühne has made a most important discovery—namely, that the violet colour does not depend on interference, but on a chemical substance soluble in bile, and suffering discolouration from light.

II.—Rahlmann.—*Structure of the Cornea* (pp. 109—115). Preparations have been made by means of fatty injections, and by puncture—by this latter, in the manner described in the *Archiv.* of de Græfe. They show that the fibrils are grouped in fasciculi, which, in their turn, decussate at different heights, in such a manner as to present the appearance of a plait or braid. There is therefore no lamelar structure.

III.—Samelsohn.—*Preparations showing how an awl had penetrated the Sclero-cornean Limit as far as the Papilla* (p. 115). —Detachment of the retina, luxation of the lens, and a detachment of the ciliary body on both sides had been produced by the cicatrice.

IV.—Berlin.—*Preparations of Detachment of the Retina in the Horse* (p. 116).—This malady, in different ways, bears a certain analogy to glaucoma, which has, however, never been observed in this animal.

V.—Kühnt.—*On a peculiar Glandular Formation of the Upper Eyelid* (pp. 117—118).—This consists of glands in the mucous tissue, which open on the surface, either conjoined two and two or separately. They appear to have hardly been observed by any one except Henle.

VI.—Leber.—*Amyloid Degeneration of the Conjunctiva, Granuloma of the Vascular Tunic, Resorption in the Anterior Chamber* (Cinnabar and Chinese Ink) (pp. 118—121).

VII.—H. PAGENSTECHER.—*Preparations for Investigations concerning Glaucoma* (p. 121).—Direct communication of the canal of Fontana with the anterior chamber and the canal of Schlemm.

VIII.—LEOPOLD WEISS.—*On Tuberculosis of the Eye* (pp. 121—131).—The tubercles are either primary, and do not depend on other tubercles, or secondary, and dependent on tubercles in some other part of the body (lymphatic ganglion). Both forms may be combined. Two preparations and two observations of ordinary tuberculosis of the vascular tunic.

IX.—HORNER.—*Preparations of Mykotic Keratitis* (pp. 131—133).—These preparations relate to the eyes of infants suffering from hereditary syphilis.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 1, 1879.

## ANNUS MEDICUS, 1878.

IT is impossible to take a retrospect of the past year without noticing the extent to which medical politics have engrossed the attention of the profession. The early meeting of the General Medical Council, the efforts of the Government to pass the Medical Acts Amendment Bill, the progress and fate of the Conjoint Scheme of medical examinations, the opposition given to the Duke of Richmond's Bill, and the agitation in favour of altering the constitution of the Medical Council, were altogether calculated to damp the interest usually taken in subjects of a more scientific nature.

To the proceedings of the General Medical Council we need only make brief allusion, as they were fully reported and editorially commented upon in the columns of the MEDICAL PRESS AND CIRCULAR. Both the first and second sessions of the Council were chiefly taken up with the consideration of the Government Medical Bill and the Conjoint Scheme. As the Government Bill had not made the Conjoint Scheme compulsory upon each division of the United Kingdom it is not surprising that the Scotch and Irish members attempted to reverse the previous decision of the Council with respect to the formation of a Conjoint Board. They were so far successful that, notwithstanding the strong representations which had been made in favour of the Conjoint Scheme by the profession and all the English medical corporations, a large minority of the Council voted against it. The rest of the session was devoted to discussing and making several important amendments in the Medical Bill. To most of its clauses the members of the Council gave their assent, to others they objected altogether. They declined the duty imposed upon them by the Bill of framing examination rules for the future regulation of medical study. They accepted the task of supervising the examination, licensing, and registering dentists, as well as the examination and registering of midwives. Exception was also, at a later period, taken to a clause in which it was provided that the license of the Conjoint Board should be a special one, and be quite independent of the existing corporations. It was during the discussion that took place on this question that Sir James Paget made an eloquent appeal in favour of maintaining the prestige and authority of the existing licensing bodies, more especially that of which he is himself so distinguished a fellow. The second session of the Medical Council was remarkable for an event which must have taken some of the more prejudiced detractors of the Council by surprise. There was a great call for a reorganisation of the Council, but it was not generally supposed that that body would ever attempt to reform itself, or even admit that any reform was necessary. We did not, however, think the Council was so selfish and so deaf to the interests of the profession as some imagined, and, consequently, we were not surprised that, on the occasion above-referred to, it was resolved that "the constitution of the Council needs revision, and that the Council do affirm and represent to the Government that it will consider what modifications of its constitution are required, and will report to the Government accordingly." Eighteen members voted for this resolution, five (the President, Drs. Andrew Wood and Quain, and Messrs. Turner and Simon) declining to vote, and one member (Dr. Hudson) being absent. The meeting of the Council in October must be fresh in the memory of our readers. It was for the sole purpose of giving directions for the carrying out of the Dentists Act. The session only lasted two days, most of the business being delegated to the executive committee and to the registrar. Our remarks on the Act have so recently appeared in these columns that we shall only now observe that the Bill passed without much opposition, that it became law on July 22, and that over 3,000 dentists have been registered under it, many of whom, unfortunately, have had no kind of medical education.

The progress and fate of the Duke of Richmond's Bill are also too well known to need any repetition of facts with which the reader is doubtless already familiar. The attempt to pass the Bill was a struggle between the Government, the Medical Council, the medical corporations, and the profession as represented by the British

Medical Association. Various concessions, or compromises, were made on all sides. At first the Government Bill was only permissive as respects the Conjoint Scheme, and was consequently very generally condemned. Then, in deference to the strong representations that were made on the subject, it was proposed, as a compromise, to make the Scheme compulsory on all the corporations, with the exception of the universities. This proposal, however, also met with strong opposition, and accordingly, the Duke of Richmond was induced to make the formation of a Conjoint Board compulsory upon all the medical corporations, without exception, in each division of the United Kingdom. The Bill passed rapidly through the House of Lords; but after it was sent down to the Lower House, his Grace was persuaded to make an amendment, in virtue of which the license of a Conjoint Board was made the sole requirement for registration. The unpopularity of such a measure can easily be conceived. It was strongly opposed by Sir James Paget and other members of the Medical Council, by the corporations, by the press, and by the profession generally. Even this difficulty might have been surmounted had it not been that the Parliamentary session was drawing to a close. For, in the hopes of still passing the Bill, certain amendments were put down for the second reading in August, which would have made the possession of a diploma necessary for admission to the Medical Register. There was, moreover, the agitation in favour of instantly reforming the General Medical Council, and against any Government Bill of which the reconstitution of that body did not form an essential feature. In fact the intemperate zeal of the medical woman party on the one hand, and of the Medical Reform Association on the other, are entirely responsible for the shipwreck of a Bill which, with the exception of the reconstitution of the Council, would have fully satisfied most members of the profession, and would, among other objects for which the passing of the Bill was so desirable, have gained that one which, of all others, was the most desirable in the cause of medical education and reform—the compulsory establishment of a Conjoint Board for each division of the United Kingdom. Now our medical reformers are very much in the position of the dog in the fable, having lost the substance in grasping at the shadow. Had the medical woman party been contented to bide its time, had it not induced the Marquis of Ripon to introduce that amendment which raised such a fresh storm of opposition against the Bill, had other parties interested in the cause of medical reform accepted the Bill in its amended shape, and allowed the question of reforming the Medical Council to be postponed to a later date, we should have now seen in England, in Scotland, and in Ireland, a Conjoint Board, from whose portals the profession would soon be recruited with medical practitioners, in whose ability the public could have full confidence, and by whose examinations the general status of the profession would have been improved. Now all is lost; and it is very questionable when and whether we shall get either a Conjoint Board or a reformed Medical Council. The Government lately informed the House that they hope to introduce and to pass the Medical Acts Amendment Bill during the current year; but, without that clause the non-insertion of which has excited so much opposition. For the Government intimated that, as the question of reforming the Medical Council is a difficult and important one, legislation on the subject must be deferred for the present. Thus, fresh opposition will be given to the passing of the Bill as it now stands, fresh excuse for further delays, so that the end of next session may see us as far off the objects at which we have been all aiming, as we ever were before.

The sanitary legislation of the last session of Parliament was marked by several important measures. Four Acts received the sanction of the legislature. The Public Health (Water) Act, 1878; the Public Baths and Wash-houses Act; the Contagious Diseases (Animals) Act, 1878; and the Factory and Workshop Act. The first Act is a short one of 14 sections, and contains important provisions for securing an adequate supply of pure water to every inhabited house. It will compel every rural sanitary authority to see that every occupied dwelling-house within their district has within a reasonable distance an available supply of wholesome water sufficient for the consumption and use for domestic purposes of the inmates of the house. Where no such supply exists, although it may be effected at a reasonable cost, the sanitary authority will have the power of serving on the owner of the house a notice requiring him, within a specified time, to provide a supply and to do all such working as may be necessary for the purpose. If neither this nor a subsequent notice have been attended to by the landlord, the authority may themselves provide the supply, may enter upon the premises and execute all such works as appear to them necessary for obtaining the supply, and may recover the expenses in a summary manner from the owner of the house. The owners of houses, however, are protected by one of the sections of the Act in virtue of which they can, on certain grounds, appeal against the notice of a rural sanitary authority, while, on the other hand, the sanitary authority cannot proceed with the execution of the works without an order of a court of summary jurisdiction or one from the Local Government Board. It is further provided that no newly-erected house shall be occupied until the owner has obtained from the sanitary authority of the district a certificate that the house is properly supplied with water. It will also be the duty of every rural sanitary authority from time to time to take such steps as may be necessary to ascertain the condition of the water supply within his district. The Public Baths and Washhouses Act is one that has been long wanted, although it is rather an enabling than a compulsory Act. It enables urban sanitary authorities to provide covered swimming baths, to make all necessary regulations for their use, and to appoint and pay needful officers. The Act also empowers the authorities to close the swimming baths for a period not exceeding five months, and in the interim to use the enclosure for the establishment therein of a gymnasium or some other means of healthful recreation. The Contagious Diseases (Animals) Act is a long Act, containing among other measures provisions relating to cattle plague, pleuro-pneumonia, foot and mouth disease, the slaughtering of diseased animals, the transit of animals, and various regulations respecting cow-sheds, dairies, and milk-shops. It must, however, be observed that the execution of this Act, instead of being deputed to the sani-

tary authorities, is placed under the supervision of the Privy Council, and deputed to local authorities who are so circumstanced as to be scarcely equal to the responsibilities imposed upon them.

The progress that has been made in medicine, and the collateral sciences is, we need scarcely say, not very remarkable, but, nevertheless, it has been certain and promising. Nothing perhaps can better show the slow advancement of the medical sciences than a consideration of the thousands of labourers who have contributed towards the building up of our present knowledge of the various branches of medicine, many of whose names are now completely forgotten. During the past year we find evidence of the slow and yet satisfactory manner in which medicine is advanced by means of a division of labour that is becoming every year more indefinitely divided and more fruitful of results. In this country, on the Continent, on the other side of the Atlantic, everywhere, we see something doing, something done, something suggested towards the advancement of the healing art. In practical medicine and therapeutics the use of such instruments as the sphygmograph, the laryngoscope, and the clinical thermometer, still enables diagnosis to claim a place among the more exact departments of our knowledge; while the treatment of disease has during the past year shown many indications of becoming more rational, more precise, and less empirical, than heretofore. Some of our oldest and most reputed remedies, as well as a few new ones, have been the subject of careful investigation. Valuable information has been gained respecting the action of mercury, arsenic, tartar emetic, morphia, belladonna, carbolic acid, salicylic acid, and even of the almost obsolete remedy bloodletting. Papers have been written on the properties and uses of duboisia myoporoides, of gelseminum sempervirens, of hyoscyamine, and sodium ethylate. The efficiency of salicylic acid in the treatment of rheumatism has been confirmed by further experience. This agent, as well as two or three others, have in some cases been given internally on antiseptic principles, with a result that warrants a further trial of them. The great value of a milk diet in the cure of both acute and chronic disease is again illustrated by the success attending Mr Teevan's treatment of cystitis. Several cases have shown the great benefit to be derived from attention to the antagonism of certain therapeutic agents. Post-partum hæmorrhage has been stopped by injections of hot water when all other means had failed. For the first time in the annals of medicine there is some hopes of hydrophobia being removed from the list of incurable diseases. Choral has been given with more than usual success in tetanus, iodide of potassium in asthma, salicylate of soda in acute rhematism.

If there be any exception to the almost imperceptible manner in which Medicine progresses as a science and an art, it is that presented by the striking and often brilliant achievements of modern Surgery. Last year, like so many others before it, testified to the truth of this statement. We have to record the improved treatment of angular and lateral curvature by the use of Sayre's plaster of Paris jacket and other instruments, more and more success in the extirpation of those tumours and the performance of those operations that involve the wounding and exposure of the abdominal peritoneum, the successful excision of large portions of the rectum for the cure of cancer, the further experience of Sir Henry Thompson in the treatment of stone in the bladder, Professor Bigelow's rapid performance of lithotrity, one or two cases of gastrotomy, and several successful cases of great or novel operations that alike testify to the skill of the operator and to the great strides that are being every year made in this department of medicine.

Considering that Obstetrics deals with a normal function of the body rather than with actual disease, it is not surprising that under this heading, our retrospect discovers comparatively little that is worthy of special notice. The vomiting of pregnancy has been on several occasions successfully treated by the application of nitrate of silver to the os uteri. The antiseptic method of performing ovariotomy has been attended with the best results. An old operation (laparo-elytrotomy) has been revived by Dr. Thomas, of New York, in place of Cæsarean section.

To go from the more practical to the more theoretical and abstract branches of study, we find that during the last year much good work has been accomplished. In Pathology we have to notice that various writers have thrown more or less light upon the nature of fever, upon certain morbid states of the urine, upon the nature and connection of croup and diphtheria, upon the pathology of valvular diseases of the heart, upon certain degenerative, inflammatory, and other morbid states of the spinal cord, upon certain changes in the cord in pernicious anæmia, upon the contagion of phthisis, and upon the morbid anatomy and pathology of certain affections of the liver and kidneys. It is, however, in the field of Physiology that the labourers have been so numerous, the labour so difficult, the results, taken singly, so out of proportion to the labour. Several important investigations have been made into the processes of development: development of fishes, development of snakes, development of cranial and spinal nerves. Researches have been conducted into the vaso-motor nerves of muscles, the placentation of apes as compared with that of the human female, the physiology of the salivary secretion, the minute structure of the thyroid gland, the nature of the lymph hearts of batrachia, the cortical lamination of the motor area of the brain, the metamorphism of tissue during the first year of life, the consumption of oxygen by the living tissues, the real origin of the cranial nerves, and many other subjects too numerous to mention. We had also to hail last year the publication of a new journal devoted exclusively to physiology, which we may take as a good earnest of the increased attention that English scientists are now giving to that branch of study.

Nor must we, in this portion of our retrospect, fail to remark that the valuable papers and scientific chatter of the medical societies were by no means an insignificant event of the year that has just passed. The most notable events that occurred in connection with these societies were the appointment by the Royal Medical and Chirurgical Society of a committee to investigate the relations between membranous croup and diphtheria, Sir Henry Thompson's summary of his experience of five hundred operations for stone in the bladder, the discussion at the

Pathological Society on the nature of lymphadenoma, and Dr. Foulis's case of extirpation of the larynx, with the substitution of an ingenious artificial voice-organ. With regard to croup and diphtheria it is probable that the discussion which will, before long, take place on the report of the Medical Chirurgical Society will be more instructive than the report itself, inasmuch as the opinion arrived at by the committee was scarcely so precise as might have been expected. They were rather in favour of the identity of the two diseases, but they recommended the employment of the term "croup" to denote simply clinical phenomena, and not any special pathological condition. If, however, the two diseases are identical, why not give them one name, if they are different diseases, then the old nomenclature might be preserved. Before leaving the societies we may remark that several other interesting papers were read, such as those on the after-treatment in tracheotomy, the use of distal ligature for the cure of aneurism, the period of incubation of scarlet fever, writer's cramp, the surgical treatment of intestinal obstruction, the use of Esmarch's bandage in the treatment of popliteal aneurism, &c.

When we consider the grave political events that have, for a considerable time, engaged the attention of the Government, we cannot be surprised that nothing has been done to remove those causes which have prevented a sufficient number of eligible candidates coming forward for the Army Medical Department.

Although something was done last year to meet the complaints that have been made, the dearth of candidates continued to increase, so that last February the Secretary of State for War appointed a committee to inquire into the subject, and to make such suggestions as, under the circumstances, appeared to them advisable. The report of the committee was not sent in till September, and owing to that fact, and to the pressure of other business, the war minister has been unable to attend to the recommendations of the committee with respect to the means that should be taken to make the service more popular. In fact, matters appear to have come to a dead-lock, and in consequence of the chaotic state of affairs no examination of candidates for the Army Medical Department was held last year. We have not space to mention in detail the recommendations above mentioned, but we may observe that the committee strangely suggested that civil practitioners might be employed to supplement or replace army surgeons, and that, in future, one-half of the vacancies might be filled up through the medium of competitive examinations, and one-half by nominations. It may be also noted that steps have been taken to re-model the Indian medical service, particularly with respect to the separation of the military from the civil medical service, and the establishment of a distinct and independent department of health; while no doubt the reader will not have forgotten that the Volunteer Ambulance Service has been recently formed, and is likely to prove a great success. Lastly, we need scarcely remark that the old stock grievance in connection with the Naval Medical Service found expression last year, as in all previous years. Some of these may have been somewhat exaggerated, and at all events there does not appear to be the same difficulty in recruiting the navy with surgeons as there has been in the case of the Army Medical Department.

Did space permit we should have something to say about the British Medical Association, whose annual meetings generally constitute an interesting feature of the medical events of the year. But we must not fail to notice that at their last annual meeting it was resolved to add to the articles of the Association the declaration that —"No female shall be eligible for election as a member of the Association." This resolution was scarcely in keeping with the spirit of the times, and it will certainly have little effect upon the professional status and prospects of lady members of the profession.

We cannot bring this brief and imperfect retrospect to a close without mentioning a few of the more distinguished men who have been taken from us during the past twelve months. We have to regret the death of Claude Bernard, of Rokitansky, and of Dr. Stokes, men of European reputation. Other well known and scarcely less distinguished names appear in the death-roll, such as James Blundell, John Hilton, Fleetwood Churchill, Dr. Payne Cotton, Mr. Carr Jackson, Sir James Coxe. Among those who, at their death, had reached an advanced age, we may mention James Syme, of Alloa, at 92; W. Bremmer, H.E.I.C.S., at 89; J. Pearson Shaw, at 88; Mr. Kelson, at 81; Dr. Humble, of Ramsgate, at 81, and many others who were equally fortunate in having spent a long life in the service of the public.

## DEATH IN DUBLIN.

### THE PUBLIC HEALTH COMMITTEE AND THE MEDICAL OFFICERS OF HEALTH.

WE noted last week that the death-rate of Dublin and its suburbs was then 38·0 per 1,000, and the mortality of the city itself 30 per cent. worse than that of the most stinking slums of London or Glasgow. This week brings to us a still worse state of things. The death-rate of the week ending December 21, reached the terrible quota of 41·0 deaths for every 1,000 of the population. This means that the mortality was more than 50 per cent. above the 10 years' average of this week; it means that 88 persons died over and above those who usually die; it means that, inasmuch as the Dublin death-rate is always largely in excess of that of other towns similarly situated—about 100 persons lost their lives in this one week over and above those who would have died in a town of average salubrity; it means that in this one week a considerable population of widows and children were reduced to destitution in consequence of this sacrifice of life.

Two causes have co-operated in producing this fatality—the rigour of the weather and the prevalence of dirt diseases: 87 persons died of chest diseases, with which cold and damp might have had more or less to do. But of these, 40 would probably have died, in any case, in the 51st week of the year, so that only 47 deaths remain as a quota towards the 88 over average which occurred within the week. The remaining 41 deaths are chargeable against dirt, stench, and sanitary neglect by the constituted authorities. But the disgraceful and inexcusable negligence of the Public Health Committee of the Corporation is respon-

sible for much more than this. Of the 47 persons over average who died, we will suppose, from the rigour of the weather, a great number would not have died, but that their constitutions had been debilitated by a lifetime of residence in the pest-houses which the corporation takes little care to remove or improve. Year after year the poor of Dublin are left to herd in tenements in which their *morale* and *physique* are equally poisoned—year after year the Public Health Committee has looked on, while the farmers of these tenements make money by rack-renting the poor and refusing to spend a shilling on sanitary improvements—year after year, the children born in such places who are strong enough to outlive infancy, are compelled to live in an atmosphere of indescribable filth, and the corporation looks on, making no serious effort at amendment, but straining its ingenuity to find excuses for doing nothing, and for ignoring the condition of affairs around it. And then, when a fall of snow occurs, we are told that the inclemency of the weather is to blame, and that the mortality is a visitation of God. It is nothing of the sort! It is the inevitable outcome of sanitary neglect by the people themselves (who, in most instances, cannot help it), and by the constituted authorities (who can, and who wilfully permit such negligence).

In Edinburgh in the past week, there was more snow, more rigour of weather than in Dublin, and yet its death-rate was 24·1 against 41·0 in "the second city in the empire." In the suburbs of Dublin, the cold and damp were the same as in the city, and yet their average death-rate was 26·2, instead of the 41·0 of the district which is supposed to be controlled by the Public Health Committee.

But, however the committee may excuse the over-mortality on the score of the weather—they cannot explain the deaths from zymotics on such an hypothesis. The Registrar-General tells us that in this week the deaths from zymotics numbered 46—that they were 14 worse than in the previous week; that 15 of them were from small-pox; that 12 of them were from fever; that the small-pox deaths were increased by 7 from the previous week; that the admissions of new small-pox patients to hospital numbered 82, or double the total of the previous week.

How does the Public Health Committee come out of the dilemma in which these figures place it? What has it done to stimulate vaccination? How has it helped to prevent infection? Where is the one corporation cab which the city of Dublin maintained at the extreme east of the city, and the corporation horse to draw said cab, which it kept at the extreme west? How much has it done to enforce the law for preventing wakes, burning clothes, disinfecting bedding, &c.? Echo needs not to answer. Every one already knows the full measure of the neglect and obstructiveness of the committee, and we now know the full measure of the fatality that neglect has brought upon the city. Last week we wrote as follows:—

"With these facts before them, it is unnecessary for us to tell our readers that Dublin—of all cities in the world—most needs an active, energetic, well-educated medical officer of health, devoted to his sanitary work and to nothing else, and well paid for performing the Herculean task of redeeming the city from its ill-name, and saving the lives of the poorer citizens who are now dying in scores from the most obvious dirt and neglect. Will it be believed that it is at this juncture—with 60 deaths a week over the usual excessive average—with small-pox rampant—with dirt triumphant—that the Public Health Committee selects to perpetrate one of its worst jobs?

"Can it be credited that that committee has proposed to leave the city without any medical officer of health at all? to pension off the present superintendent medical officer at £120 a year for life? and to put his duties upon the remaining medical officer of health, with a considerable increase of salary. We have said that, if this proposition be carried the city of Dublin will be, to all intents and purposes, unprovided with any supervising health officer, and we justify the statement by asserting that it is notorious that the medical officer of health who is to take the additional duty of superintendent medical officer is hardly able, by super-human energy, to keep abreast of his present multitudinous employments."

The alarm which we thus raised has been taken up by the *Dublin Daily Express*, which says:—

"The bye-streets, the lanes, and alleys, with their wretched tenements, which are rotting in filth, still remain as hotbeds of disease, and no adequate measures have been taken to make habitable and healthy dwellings for the poor. We are willing to give full credit for what they have tried, however feebly, to do, but they have scarcely yet realised the full measure of their responsibility as legal guardians of the public health. So far from this, indeed, they have reduced their sanitary staff, and now propose to practically abolish the post of medical officer of health altogether, and so deprive the public of the benefit of an independent and efficient inspection. It is proposed to let the senior officer retire on a pension of £120 for life, and to transfer his duties, with, of course, an increased salary, to his assistant officer, the city analyst. We have no hesitation in repeating that this proceeding—we care not whether it is a job, or a piece of well-meant, but ill-advised, economy—will be equivalent to the abolition of an office to which the Legislature has attached the highest importance, and which, in reality, affords to the public the only guarantee for efficiency in the working of the Public Health Act. The city analyst is an excellent officer in his own department, but his professional duties are too multifarious and pressing to allow him time to undertake so responsible a trust. If it were intended to expose the Public Health Act to ridicule as a useless and absurd measure, it could not be more effectually done than by handing over the whole charge of superintending its application, in such a city as Dublin, to a gentleman who, besides various other duties, is at present analyst not only for this city, but for every county in Ireland, with only three or four exceptions."

We earnestly protest against any and every proposal which will leave the city without an active executive health officer. Few men could as worthily fill the chief office in sanitary administration as Dr. Cameron; but we want to see much more energy infused into that office than has ever been displayed, and we cannot believe that it is physically possible for the city analyst to do justice to this most important function in addition to his present occupations.

---

Notwithstanding the numerous high posts which the late Baron Rokitanski held, the emoluments he derived from them were very moderate, and he died almost a poor man for one in his distinguished position. In consideration of his services to science and the State, the Government, besides a continuance of his pension to his widow has conferred upon her a "special donation."

# Notes on Current Topics.

## The Broadmoor Criminal Lunatic Asylum.

ABOUT twelve months ago we gave a full description of this Asylum, together with some interesting facts drawn from a report of it for the year 1876. The Report which we have just received is for the year 1877, and appears to be much more satisfactory than could be expected of one that relates to a criminal lunatic asylum. Upon the 1st January, 1877, there were in the asylum 389 men and 104 women, making a total of 493. During the year 34 men and 9 women were admitted; 7 men and 5 women were discharged upon recovery; 24 men and 4 women were transferred to other asylums; and 12 men and 3 women died. The asylum is capable of accommodating 413 men and 150 women; and at the end of the year there were 33 vacancies in the male, and 49 vacancies in the female division. Of the 43 persons admitted in 1877, 15 men had become insane whilst under sentence of penal servitude for life, whilst 19 men and 9 women belonged to the class comprising persons detained during her Majesty's pleasure, or certified to be insane before trial. The great majority of the persons who were admitted under orders of detention during Her Majesty's pleasure were persons who were charged with murder or attempt to murder. Of this class of persons there were 399 in the asylum on 31st Dec., 1877, and of this number one-half were charged with the actual taking of life, while more than another quarter were charged with attempts to murder or maim. The general health of the inmates was satisfactory, their conduct was good, and there were no epidemic diseases throughout the year, no serious accidents, no grave acts of violence, no suicides, no instances of escape, and no forms of mechanical restraint used in any part of the asylum. To keep so large a number of criminal lunatics in such good order as the above facts would indicate, a large staff of able attendants is absolutely necessary. Consequently, we find that there are in the asylum 72 male and 22 female attendants, and that of the former as many as 23 have been over 5, and 30 over 10, years in the service of the Institution. It would appear that all the 15 persons admitted under sentence of penal servitude were, at the time of their removal to Broadmoor, within a few weeks of the periods at which their sentences would expire; and that their offences were not of a very grave nature, consisting chiefly of larceny (8), burglary (3), arson and wounding. It would be worth while knowing what percentage of all criminals undergoing sentence of penal servitude are sent to this or other asylums on account of their showing symptoms of insanity. That petty larceny and other similar offences are often the result of that disease, and among its first symptoms is a well-known fact; and most probably, most or all of the above 15 persons were really suffering from insanity at the time they were sentented to penal servitude.

---

A NEW children's sanatorium was opened on Saturday last at Southport by Lady Lindsay. The cost of the building was £4,000, which was subscribed beforehand, and the institution stands free of debt.

## Effects of Varnishing the Skin in the Lower Animals.

WHEN varnishing is complete the duration of life is short; when it is partial the fatal issue may be delayed for a good many days. From one-eighteenth to one-twelfth of the total surface of the body may be varnished with impunity; but when the proportion exceeds one-sixth death is inevitable, unless the animal is packed in cotton-wool or kept in a warm chamber. Two theories have been brought forward to explain these phenomena. Lomikowsky has considered it necessary to re-investigate the subject, with a view more especially to ascertain the reason why the temperature of a varnished animal should sink so rapidly as it does. By means of the thermo-multiplier he has proved that radiation takes place much more freely from varnished than from unvarnished areas of skin. The difference is sufficient to account for the loss of heat and the fall of temperature, which may thus be regarded as physical rather than physiological phenomena. The symptoms observed during life and the changes found in the viscera after death may all be accounted for by the cooling. They are absolutely identical with those observed in animals killed by exposure to cold. When the cold is extreme death occurs rapidly, as after universal varnishing. When it is more moderate inflammatory changes are excited in internal organs, more particularly in the kidneys, and life is destroyed indirectly, as a consequence of uræmia. Here, again, the analogy with partial varnishing is complete.

## New Microphone and Stethoscope.

AT a late meeting of the Franklin Institute, New York, Dr. Norris presented and described a new form of microphone, devised by himself, in which he employs a cylinder of wood or other light material, about 3″ in diameter, and 4″ long, placed horizontally, over either end of which is stretched a membrane, forming two diaphragms. To the centre of one of the diaphragms is attached a silk thread, which passes over a small pulley, and has suspended at its end a metal cone with a carbon point. This cone is made hollow, in order that its weight may be adjusted by adding small shot. Directly under the cone is placed a carbon rod, adjustable perpendicularly, so as to secure a very delicate contact. The electric circuit is completed through it, the cone, and a Bell telephone. This instrument is very sensitive to sound, and with a stethoscope, connected with the cylinder by means of a flexible tube, was designed to aid in the study of the sounds of the heart and lungs.

## The Proposed National Public Health Board in America.

ACTIVE measures are in progress toward the establishment of a National Public Health Board, for the purpose of improving public hygiene, for carrying out scientific and systematic investigation into the causes and preventive measures of epidemic, contagious and infectious diseases, and in collecting the vital statistics of the United States on some uniform and general plan. A memorial has been drawn up and will be presented to Congress with this object.

## Some Adulterations of Essential Oils.

LEONHARDI, in the *Archiv der Pharmacie*, describes some new sophistications of essential oils. The stearoptene of fennel oil, he states, is imported from Russia for adulterating oil of anise, to the extent, sometimes, of 90 per cent. The fraud is detected by heating the oil, when the characteristic odour of the fennel becomes apparent. Oil of coriander and oil of bergamot are adulterated with rectified oil of orange; the admixture may be discovered by the relatively sparing solubility of oil of orange in 90 per cent. alcohol. He has found also oil of caraway adulterated with oil of turpentine; the fraudulent oil forms a turbid mixture with 90 per cent. alcohol. As the best test for the presence of alcohol he recommends the addition of a crystal of aniline red.

## Small-Pox in Dublin.

SMALL-POX is on the increase both in Dublin and the country districts. The returns for the past few weeks show a steady increase, and it is believed they only represent a small proportion of the actual number of cases existing. In some towns south of Dublin a state of affairs amounting almost to a panic prevailed recently, but the facts were concealed. The accommodation is very defective, and in the country places it is found necessary to convert barracks and public buildings into hospitals. The sudden re-appearance of the epidemic has caused great uneasiness, and the medical authorities are said to be unable to offer any explanation of it. It is, however, well known that in some parts of Ireland vaccination is very much neglected, and that on more than one occasion this neglect has had much to do with the extension of small-pox epidemics in Dublin and the surrounding district.

## Deterrent Effect of Capital Punishment,

SOME time ago we wrote an article on capital punishment with the intention of showing on a subsequent occasion, and on psychological grounds, that capital punishment must be necessarily deterrent of the crime of murder. The *Standard* gives some interesting figures bearing upon the subject, and with special reference to the frequency of the crime of murder in the Canton of Fribourg before and since the abolition of the death penalty, have just been published. In this canton, which has 110,000 inhabitants, there were only seven cases of murder in the ten years between 1864 and 1874. In the latter year the punishment of death was abolished throughout the Confederation. During the three years immediately following that event no fewer than fifteen murders were committed in the canton, while this year alone there have been five cases of homicide, making altogether twenty in four years. Thus, when capital punishment prevailed, the murders were at the rate of less than one a year; now they occur at the rate of five a year.

## A Psychological Study.

APROPOS of the foregoing "note," our attention is drawn to a trial which has just been brought to a close which has created a great sensation in the town of Auxerre, where it took place. Two young men, named Perront and Barré, were accused of having murdered their grandfather and grandmother for the sake of a little money, which the old people had laid by. The prisoners did not deny their guilt. On the contrary, they rather seemed to glory in recounting the details of the murder. Neither of them would consent to express contrition for their crime. Perrot was sentenced to death, and Barré to penal servitude for life.

An eminent German physician thinks that the worst forms of criminal depravity often depend upon a peculiar conformation not only of the brain, but of the cranium, which may even be recognised during the life of the criminal. If any criminals could be found whose crania would, on examination, justify the views of the German *savant*, we should say that these two young villains were just the very specimens wanted. Such horrible depravity in mere boys, such an utter want of the moral instinct, must have had in them some physical basis, which might, on a careful examination, be detected in their brains, even if unassociated with any peculiarity in the development of their cranium.

## Prolapse of the Rectum in Infants.

IN a recent number of the *Wiener Medizinische Zeitung* Dr. Basevi suggests an improved method of treating this troublesome affection, which he finds most successful. He cauterises the mucous membrane of the intestine lightly with nitrate of silver, and replaces the gut. Subsequently enemata of tannin, alum, and ice-water are ordered, together with very strict diet, with a view to prevent enteritis. Should these measures fail and the intestine continue to come down, he uses his bandage as follows:—The child is held by two nurses, with its buttocks up, over the bed, one securing the upper portion of the body, the other the slightly abducted knees somewhat up in the air. This position is most favourable for the reduction of the prolapsed rectum, because the child cannot beer down. After reposition the surgeon stands on the right side of the bed, with the thumb of the left hand pressing the child's left buttock to the right, while the fingers bring the right buttock towards and against it. With the right hand several strips of plaster of some two finger-breadths are drawn from below upwards and outwards, overlapping one another, across the buttocks, from one trochanter to the other. The strips should approach the perineum as closely as possible. As a support to the plaster, a spica bandage of two or three finger-breadths is run over the lower part of the body. A gutta-percha or waxed paper covering can be used to keep the buttocks clean during defecation, and this bandage can be retained in position for a couple of weeks. If diarrhœa be present, astringent enemata may be employed; if constipation, laxative enemata; and these should be given by the physician himself, for fear of disturbing the bandage, which can be changed without difficulty when necessary.

ASSAFŒTIDA is exported from Afghanistan to Hindostan. The Ameer extorts at various places a duty of £13 per camel load, about 4 cwts.

## Diphtheria in Germany.

THE *Frankfürter Journal* states that diphtheria has made its appearance in an epidemic form at Mayence. A private boarding-school has been closed by the local authorities on account of the cases which have occurred among the pupils. Not long ago we were at Mayence, and from our experience of the sanitary condition of that town, an epidemic of diphtheria might prove to be a serious matter, with regard both to the virulence and the extension of the disease.

## A Medical Explorer.

Dr. THOLOZON, physician to the Shah of Persia, is organising an expedition for the exploration of Khurdistan. He proposes to leave Basra on Feb. 1 next, and will first of all explore the Korun and the "Carrage," or dam of Ahwas, constructed in the fourth century by King Sapor, but now in ruins. By repairing, says the *Academy*, this bar, a plain many hundred square miles in extent, and renowned in former ages for its fertility, might be irrigated.

## The Weather and its Effects upon Mortality.

THE severe weather of last week and the prevailing distress in the manufacturing districts combined to swell the rate of mortality last week to almost epidemic proportions. It is many years since so high a death-rate has been reached as that recorded in the Registrar-General's last returns. London is supposed to be one, if not *the* most healthy of European cities, frequently averaging no more than 18 or 19 deaths per 1,000 of its population. Last week, however, it reached the high figure of 31; even Brighton shared in the general mourning with the same number, whilst several other large towns far exceeded this. These were: Leeds 32, Leicester 32, Bradford, 34, Sheffield 34, Wolverhampton 34, Norwich 35, Plymouth 35, Bristol 36, Manchester 38, Glasgow 38, Liverpool 39, Dublin 41, Salford 41, and Oldham 42 per 1,000, of the various populations. It will thus be seen that these two factors have produced alarming results, and the week ending Christmas Day, 1878, will be remembered as one of the severest and most fatal on record.

## Effects of Publicity on Suicide.

AN Italian medical society which meets at Pisa, recently sent a request to the various Italian papers to cease reporting suicides, stating that after careful study of the subject they had reached the conclusion that such publicity tends, at least in Italy, materially to increase the number of those who destroy themselves. The motive is sometimes imitation, sometimes a morbid thirst for notoriety.

AT the Hygiene Congress of Paris it was stated, during the discussion on the influence of tobacco on health, that Dr. Strohen, eighty-six years of age, the father of eleven children, and in the enjoyment of perfect health, has, for sixty-five years, smoked fifteen cigars daily.

WE are pleased to notice that the appointment of Dr. T. Whiteside Hime as medical officer of health for the Borough of Sheffield, has not necessitated the resignation of his hospital appointments. It is the first case of the kind we remember in which a hospital physician or surgeon has become a candidate for this supplementary post, it being usually understood that he must resign one if appointed to the other. Some of these posts are valuable, worthy the attention of first class men, and the appointment of Dr. Hime will probably stimulate others to follow his example. The emolument in this instance is £300 per annum, and is not prohibitory as to private practice.

PREVIOUS to his departure from America, Dr. Andrew Clark (who accompanied the Prince Louise and Marquis of Lorne to Canada), delivered a lecture before a crowded audience of medical men and students, at the Bellevue Hospital, New York; after which a reception was rendered him at the house of Dr. Sayre, at the close of which he left for the steamer with the heartiest wishes of the company of distinguished physicians who had been invited to meet him.

IN the principal foreign cities, the rates of mortality, according to the most recent weekly official returns were, in Calcutta, 52; Bombay, 31; Madras, 43; Paris, 26; Geneva, 21; Brussels, 33; Rotterdam, 24; The Hague, 28; Stockholm, 23; Christiania, 25; St. Petersburgh, 42; Berlin, 28; Hamburg, 27; Dresden, 24; Breslau, 30; Munich, 32; Vienna, 29; Buda-Pesth, 35; Rome, 30; Naples, 26; Turin, 25; Venice, 28; Alexandria, 40; and New York 21 per 1,000 of the population.

PROF. TYNDALL will deliver his lecture on the electric light, at the Royal Institution, on January 17th. The Christmas course of juvenile lectures will be by Prof. Dewar, the subject being entitled "A Soap-Bubble." Amongst the other lectures already announced is the "Mirror of Japan and its Magic Quality," by Prof. Ayrton.

A CORRESPONDENT writing to us from the Diamond Fields in South Africa, mentions the almost unprecedented fact that the rainfall during the past twelve months amounted to only seven inches.

THE mortality from diseases of the respiratory organs last week exceeded the average throughout the kingdom. In Sheffield, Leeds, Salford, Liverpool, and Glasgow it was very marked, whilst in London alone, 650 succumbed from these causes, being 172 beyond the average.

THE only deaths from small-pox recorded throughout the kingdom last week, were 14 in London and 15 in Dublin. Scarlet fever has much declined everywhere, whilst diphtheria and enteric fever are slightly on the increase.

DR. WHITMORE, the Medical Officer of Health for the Marylebone District, reports an authenticated case of the death of a centenarian widow at the age of 103.

# Literature.

## THE MANAGEMENT AND DISEASES OF THE DOG. (a)

THOUGH books on the management and maladies of the dog are numerous, yet there was ample room for another when Mr. Hill's work appeared. We required a guide provided with more recent knowledge, and that knowledge embracing a wider and deeper acquaintance with the sciences of physiology and pathology as they exist now-a-days, than is to be found in the pages of Blaine or Youatt. Mr. Hill's "Management and Diseases of the Dog" is eminently practical, and even when dealing with technicalities, it does not extend beyond the comprehension of the amateur or uninitiated dog-owner. To all who have to do with dogs, or own these creatures, the book will prove of great utility; including as it does, everything pertaining to the treatment they should receive in health and disease, as well as simple yet sufficient directions for the management of injuries and accidents. There is much to interest medical readers in the chapters on diseases of the nervous system, general diseases, and the diseases incidental to pregnancy and parturition. The section on rabies is particularly worthy of attention, and, altogether, those members of the profession who keep dogs, are fond of dog-lore, love their neighbours' or patients' pets, or are interested in canine pathology, can be recommended to a perusal, or even study, of the book. It is well and abundantly illustrated, and fails in nothing, so far as the publishers' department is concerned. The portrait of the English mastiff, which forms the frontispiece, is particularly good. The book is, in reference to the author and publishers, a distinct advance on all works of the kind hitherto issued.

## DISPAUPERISATION. (b)

AMONG social evils retarding the moral and material advancement of this country, drink and indiscriminate almsgiving, in which latter must be included a mal-administered, defective, and unscientific Poor-law, probably hold the foremost place. Any contribution to the popular exposure of such evils, based, as is the treatise before us, upon sound science, must be acceptable, and we cordially welcome the second edition of Mr. Pretyman's valuable and able work. We trust it may find an extensive circle of readers; and we think that no greater service towards the promotion of their objects could be performed by the Charity Organisation Society than the circulation among the public of this book, or, at least, an *epitome* of the facts and arguments which it contains. The ignorance of the great bulk of the well-to-do and charitable public on this subject is astonishing; they do not understand why and how the indiscriminate distribution of eleemosynary aid fosters and increases the ills they desire to relieve, and until these truths are universally comprehended and appreciated, it is almost hopeless to attempt to grapple with the deep-rooted wrongs which Mr. Pretyman and other writers on political economy have exposed. As a popular work Mr. Pretyman's treatise is especially well conceived; and rightly refraining from making it purely didactic in character, he has scattered through his pages many amusing authentic anecdotes and sketches, which, while illustrating the subject, make the whole well-nigh as entertaining as a novel.

# Correspondence.

## THE SOCIETY OF APOTHECARIES *v.* SHEPPERLEY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I enclose a statement in reference to the recent case of the Apothecaries' Society *v.* Shepperley.

I cannot ask you to insert that statement in your paper *in extenso*, but the effect of it will, I think, be found correctly given as follows:

It is attempted to be shown, first, that the Society had reasonable grounds to authorise the prosecution of Mr. Shepperley in the county court at Nottingham, which is borne out by the decision of the county court judge having been in favour of the plaintiffs. Secondly, that the trial which took place before Mr Baron Pollock was forced upon the plaintiffs by the observations of the two judges before whom the question of law involved in the decision of the county court judge, came for argument. Thirdly, that the verdict of the jury upon the trial before Mr Baron Pollock merely dealt with the actual facts of the case, and involved no important question of law on the one side or the other. Fourthly, that the position of the Society in the matter of prosecutions is a most difficult one, as established by the fact that they have now received an intimation in two pending cases (where they claim to exercise a discretion, either as to the Court in which the proceedings shall take place, or as to the authority being given at all to prosecute), that a mandamus will be applied for requiring them either themselves to prosecute, or to allow the intending prosecutors to do so.

It will be seen from this, that the discretion which the Society wish to exercise in the matter of prosecutions is to be called in question, and that the Society are not, as is evidently presumed by the public, either conducting these prosecutions themselves out of any funds of their own, or anxious to allow them to be instituted without reasonable cause.

The feeling of the leading members of the Society themselves is undoubtedly adverse to these prosecutions, but on the other hand the feeling of the licentiates of the Society, or of a large number of them, is apparently the other way, and, perhaps, as appears in the enclosed statement, it will place the Society in the fairest light if the intended application for a mandamus is fully heard out.

I am, Sir, your faithful servant,

JAMES RICHARD LAYTON.

20 Austin Friars, E.C., Dec. 24, 1878.

[To the readers of a medical journal, at least, the legal representative of the Apothecaries' Society need make no apology for the countenance given by the Society to the prosecution of a counter-prescriber. It is our view—very distinctly—that the Society is, and was, bound to enforce the law entrusted to it for the protection of the public and its licentiates against the unlicensed practice of incompetent persons; and that it would have done less than its duty if it had refused to co-operate in such a procedure. We have very little regard for the views of "the leading members of the Society" upon the subject. "Leading members" (*i.e.*, members with plenty of money in their pockets) have usually few sympathies in accord with the necessities of the rank and file of any profession. The Benchers are not seriously concerned whether Mr. Briefless lives or starves. The Medical Council don't trouble their heads whether the general practitioners are or are not driven to the wall by the quacks; and we quite expected to hear—as Mr. Layton informs us—that the "leading members" of the London Apothecaries' Society are placid under the narrative of the licentiate apothecaries' woes. The mistake (if any) committed by the Society was in giving countenance to any case in which they had not satisfied themselves that the evidence was conclusive. We submit, with every respect to the Society, that it will look foolish if it takes up the cry of "Don't nail his ears to the pump." It is not dignified in the Society to suggest that it is ready to back out of the legal position which it accepted if it can do so with any plausibility, but is also quite ready to pursue its original course if it has the excuse of a mandamus for doing so. If prosecution of counter-prescribers be its prerogative or duty, it should prosecute without hesitation; if not, it ought to be able to decide for itself, without any mandamus.—ED. M. P. & C.]

(a) "The Management and Diseases of the Dog." By J. W. Hill, F.R.C.S. London: Baillière, Tindall, and Cox.

## PRIVATE LUNATIC ASYLUMS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have read with much regret in the colums of your contemporaries most ungenerous and unworthy motives attributed to those physicians engaged in the treatment of insanity. Such undeserved reflections and epithets as have been used, are almost sufficient to disgust the sensitive mind of the gentleman from embarking either his talents or his capital in an undertaking that demands not only the noblest and most human attributes of our nature, but most certainly the highest grade of science and talent. It is not necessary that I should take up your space further than to point out the present mode of governing private lunatic asylums, and with respect to the law for their regulation, I am gratified in stating it is both sanitary and stringent, and the Act of Parliament for their regulation is most ably carried out under the supervision of the Inspectors-General of Lunatic Asylums, who have not only the full confidence of the Government, but also that of the country in general.

I have to acquaint you that the law provides that no person can keep a house for the reception of and treatment of insane patients until it is first duly licenced, and which licence must be granted in open court at the sessions for the peace for the district, signed by the chairman and the magistrates present. Previous to the granting of such, fourteen days' notice must be given in writing to the clerk of the peace, in which is set forth the number and sex to be accommodated, together with the plan of such house, the number of apartments, their length, breadth, and height, an exact copy of which must be transmitted to the Inspectors-General previous to the granting of the licence. The Act also enjoins that no person shall be received or detained in any licensed house without an order, and the medical certificates which must be signed by two disinterested medical persons, who have no connection whatever with the establishment in question. Their visits to the patients must not be at the same time, but at separate periods, previous to their signing the certificates, under pain of being guilty of a misdemeanour. An exact copy of such certificates and order must then be forwarded to the Inspectors on the reception of the patient into the asylum. Any neglect of such is deemed a misdemeanour.

The establishment, the patients, the registry, case-book, medical journal, and certificates, are frequently examined by the Inspectors, after which the observations of those functionaries and the dates of their visits are inserted in the Inspector's report book. The period of those visits are always unknown to the proprietor, and may be made either by night or by day. The Inspector will have to be informed as to the religious consolations provided for the patients, as well as the various descriptions of amusements. Those minutes are laid before the county chairman and magistrates at the sessions for the peace of the district, previous to the renewal of the licence. At any of the visits of the Inspectors, should they doubt the propriety of the detention of any patient, they generally make a second visit within a certain period, accompanied by a medical officer, and should they deem it meet to discharge such patient, they insert such in the Inspector's report book, and give an order to that effect.

Under such circumstances, and as the law at present exists, I am not aware how an unlawful detention can take place. There may be apparently undue detention, as the phases of their indisposition are often such as would undoubtedly deceive the inexperienced, and more especially those cases that are of an intermitting character.

I am, Sir, your very obedient servant,

JOHN PEPPARD, M.D., M.R.C.S. Eng.

Cookestown House, Piltown, Co. Kilkenny.

## SOCIETY FOR TOTAL ABOLITION OF VIVISECTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The gratuitous attack in your issue of the 18th Dec., signed T. W. Grimshaw, is of a misleading and injurious nature.

The insinuation that I am not *Honorary Secretary of the Society* is incorrect; so also is the statement that I "failed utterly to prove that experiments on animals were performed in hospitals."

Mr. Erichsen admitted that experiments were performed in hospitals. The hospital yearly prospectuses issued by the authorities proved the facts, and some physiologists openly avowed and acknowledged it.

Dr. Grimshaw does not appear to have carefully perused the evidence given by the Society before the Royal Commission, and published by Pickering, or even read the much abbreviated version of that evidence issued by the Commissioners.

Dr. Grimshaw says: "This same Mr. Jesse was afterwards brought before the Superior Courts in London by the Society for the Abolition of Vivisection in order to make him disgorge the funds of the Society. The Court issued an order in accordance with the application," and he refers to the case Holt *v.* Jesse, before Vice-Chancellor Malins.

By Vice-Chancellor Malin's order, a public meeting of the subscribers to the funds of the Society was held (on the 19th July, 1876). At that meeting the three assailants who had vainly endeavoured to eject me from my office and obtain control of our affairs, must have felt themselves placed in a humiliating position. I was, by an overwhelming majority, confirmed in the post of Honorary Secretary, and that of Honorary Treasurer was also pressed upon me. I refer unbiassed and honourable men to that case, with the assurance they will come to the conclusion that Dr. Grimshaw's statement is erroneous and unjustifiable.

What the object can have been of the insulting attack which Dr. Grimshaw has made upon me personally in endeavouring to cast an imputation upon my character is best known to himself. I request that he will at once give an adequate apology.

I am, Sir,

Your obedient servant,

GEORGE R. JESSE,
Honorary Secretary and Treasurer, Society Total Abolition, &c., Vivisection.

Henbury, near Macclesfield, Cheshire.

# Medical News.

**University of Cambridge.**—The following candidates passed the Second Examination for the degree of M.B.:—

| | |
|---|---|
| Browne, O. A., B A., Trinity. | Fuller, H. K., B.A., St. John's. |
| Brunton, B.A., St. John's. | Holthouse, B.A., Trinity. |
| Bullar, J. F., B.A., Trinity. | McAlister, B.A., St. John's. |
| Colman, B.A., Corpus. | Nichols, J.P., B.A., St. Catherine's |
| Coxwell, B.A., Christ's. | Wolfenden, B.A, Christ's. |

The frllowing passed the Third Examination for the degree of M.B.:—

PART I.

Black, B.A., Caius and St. Thomas's Hospital.
Collingridge, B.A., Christ's and St. Bartholomew's Hospital.
Fowler, J. K., Caius and King's College Hospital.
McLaren, B.A., St. John's and Edinburgh.
Norman, B.A., Downing and St. Bartnolomew's Hospital.
Prickett, M.A., Trinity and St. Bartholomew's Hospital.
Steavenson, Downing and St. Bartholomew's Hospital.
Stanley Taylor, B.A., Pembroke and Guy's Hospital.
Waldo, M.A., St. John's and St. Bartholomew's Hospital.

PART II.

| | |
|---|---|
| Black, B.A., Caius. | Prickett, M.A., Trinity. |
| Collingridge, B.A., Christ's. | Steavenson, Downing. |
| Fowler, Caius. | Stanley Taylor, B.A., Pembroke. |
| McLaren, St. John's. | |

**University of Dublin.**—The following degrees were conferred, after Examination, on the 18th ult.:—

BACHELOR IN MEDICINE.—Fausset M. Baker, Wm. Deane Freeman, Robert Charles Gage, Charles O'Grady Gubbins, Henry Love, Thos. Tilly Moore, Edmund Myles, Henry Walker Murray, Ashley John Westby, John Robert Yourdi.

DOCTOR IN MEDICINE.—Abraham Colles, Francis Pierce, Patrick Hy. White

BACHELOR IN SURGERY.—Arthur James Campbell, William Deane Freeman, Joseph Gibson, Chas. O'Grady Gubbins, Reynolds Peyton Hetherington, Edmund Myles, Ashley John Westby, John Robert Yourdi.

MASTER IN SURGERY.—Faussett M. Baker, Robert Charles Gage, Ashley John Westby.

## SALICYLIC ACID IN DIPHTHERIA.

At a time when diphtheria is attracting so much attention it may be worth while noticing any treatment that has been found serviceable in this much dreaded disease. An American physician, Dr. W. F. Jackson, states in the *Canada Lancet* that the acid acts upon the disease in a curative manner, and with a certainty which claims for it the attention of the profession. He gives it internally in small but frequently-repeated doses, made into a mixture with gum arabic and simple syrup, a solution of carbolic acid and glycerine being also applied to the throat. But as he admits, the number (4) of cases in which he has tried the drug is much too small to base upon it any firm opinion of the real merits of salicylic acid in the treatment of diphtheria.

## NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

Dr. Thorowgood has been selected to deliver the Lettsomian Lectures at the Medical Society of London on the evenings of Jan. 6, 20, and Feb. 3. Subject: "Bronchial Asthma."

Wood.—There is a rage just now for wood-pavements, especially around hospitals, churches, &c. Recently, the governing body of St. Paul's Cathedral were debating the desirability of adopting this method of quiet street traffic, when a wit naively suggested that they had only to put their heads together to solve the difficulty. They did, and the roadway is now quite soft, though a little lumpy here and there.

Dr. Phillips.—A note has been made of your request.

Dr. W.—The error was an excusable one on your part; it has been rectified in copy.

Extraordinary Fecundity.—A more striking example of human fecundity we have rarely heard of than that reported in a recent number of a Berlin contemporary, of a woman residing at Schlossberg, in Germany, who has brought eight children into the world in two and a-half years. Two years ago, she had twins; last year, she had triplets; and on October 30, of 1878, she was delivered of three fairly strong and healthy boys.

Dr. Black.—Thanks for telegram; a letter was written you, but mislaid; hence, the short notice.

Neither the *Medical Times and Gazette*, *British Medical Journal*, or *Pharmaceutical Journal* of the past week reached us up to Saturday night.

The Gold Medal in Dentistry.—The *Gazette des Hôpitaux* announces that this distinction for dentistry has been awarded to M. Preterre, of Paris, Editor of the journal *L'Art Dentaire*.

Dr. Knowles.—The subject has been already thoroughly threshed out, we are unable to devote more space to it at the present time.

Dr. Wood.—We agree with you that such conduct is scarcely professional, certainly not such as will be likely to ingratiate the gentleman concerned with his brother practitioners in the neighbourhood.

Epidemiological Society.—This (Wednesday) evening, at 8.30, Dr. Wm. Johnston, of Leicester, will read a paper "On the Etiology of Summer Diarrhœa."

Dr. Andrew Clark, Dr. John Harley, Dr. Charles Fryer, Dr. Williams, Dr. Bodington, Dr. Hudson, Dr. Hunter, Mr. Bryant, Mr. Jackson, and Mr. Wilson will please receive our best thanks.

Obstetrical Society of London.—This (Wednesday) evening, at 8 o'clock, Annual General Meeting.—Ballot for Officers for 1879.—Amended By-laws will be submitted to the Fellows; and the President will deliver the Annual Address..

### VACANCIES.

Bristol General Hospital.—House Surgeon. Salary, £100. Assistant House Surgeon. Salary, £50, with board in each case. Applications before Jan. 8 to the Secretary.

Celbridge Union, Kilcock Dispensary.—Medical Officer. Salary, £115, with fees, &c. Election, Jan. 14.

Central London Sick Asylum.—Assistant Medical Officer for the Cleveland Street Asylum. Salary, £100, with board. Address the Clerk of the Managers before Jan. 4.

City of Dublin Hospital.—House Surgeon. Salary, £100 per annum. Full particulars on application to Surgeon Wheeler, 27 Lower Fitzwilliam Street, Dublin. (See Advt.)

Clonmel Union, Ballymacarbry Dispensary.—Medical Officer. Salary, £100, with fees, &c. Election, Jan. 13.

Devonport, Royal Albert Hospital.—Junior Surgeon. Further particulars of the Secretary. The appointment is for five years

Longford Union, Killashee Dispensary.—Medical Officer. Salary, £120, with fees, &c. Election, Jan. 14.

Manchester, Owens College.—Lecturer in Medical Jurisprudence. Particulars of the duties and emoluments of Dr. Gamgee at the College.

Melton Mowbray Union.—Medical Officer for the Waltham District. Salary, £40, with extra fees. Applications to the Clerk, Union Offices, Melton Mowbray.

Shropshire Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board. Applications to the Medical Superintendent before Jan. 4.

University of London.—Registrarship. Salary, £800, increasing £25 until the maximum of £1,000 is reached. Applications not later than Feb. 1.

Worcester General Infirmary.—House Surgeon. Salary, £100, with board. Applications to the Secretary on or before Jan. 13.

### APPOINTMENTS.

Bowen, E., L.R.C.P.Ed., M.R.C.S., Medical Officer for the Kessingland District of the Mutford and Lothingland Union, Suffolk.

Copeman, E., M.D., Consulting Physician to the Norwich Hospital.

Finlay, Dr., Medical Officer, &c., for the Ballycroy portion of the Achill Dispensary District of the Newport Union.

Gover, H. J., M.R.C.S.E., Medical Officer for the High Easter District of the Dunmow Union, Essex.

Hamilton, W., M.B., Medical Officer, &c., for the Dromahair Dispensary District of the Manorhamilton Union, co. Leitrim.

Hawkins, J. S., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Hollymount, co. Mayo.

Heap, C. S., L.K.Q.C.P.I., M.R.C.S.E., Medical Officer for the Biddenden and High Halden Districts of the Tenterden Union.

Henderson, G. C., M.B., M.R.C.S.E., Resident Medical Officer to University College Hospital.

Hime, Thos. Whiteside, M.D., Medical Officer of Health for the Sheffield Urban Sanitary District.

Hollis, E., M.B., C.M., House Surgeon to the East Suffolk Hospital, Ipswich.

James, W. D., M.R.C.S.E., Lecturer on Physiology at the Sheffield School of Medicine.

Leigh, W. W., M.R.C.S., Medical Officer of Health for the Llanfabon Sub-district of the Pontypridd Rural Sanitary District.

Monro, C. E., L.R.C.P., M.R.C.S., Medical Officer for the Llanllwchaiarn and Bettws District of the Newtown and Llanidloes Union.

Morris, C. K., M.R.C.S.E., Medical Officer of Health for the Spalding Urban Sanitary District.

Munro, A. B., M.D., Medical Officer of the North East District of the Bradford Union.

Redmond, G. O'Connell, L.K.Q.C.P.I, L.R.C.S.I., Certifying Factory Surgeon for Cappoquin, co. Waterford.

Roome, H. A., M.B., C.M., House Surgeon to the Royal Surrey County Hospital, Guildford.

Stevenson, F. L., M.B., C.M., Medical Officer of Health for the Honiton Urban Sanitary District.

Taylor, A. H., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer and Medical Officer of Health for the Clonmoyle Dispensary District of the Macroom Union.

Weekes, F. H., M.R.C.S.E., House Surgeon to the York County Hospital.

Army Medical Department.—Deputy Surg.-General T. C. O'Leary, M.B., retires on temporary half-pay; Surgeon-Major A. Croker retires upon temporary half-pay; Surgeon C. A. Daubeney resigns his commission; Surgeon M. J. Ryan to be Surgeon-Major.

## Birth.

Duncan.—Dec. 22, at Castletown, Fintona, the wife of Thos. Duncan, M.D., of a son.

## Marriage.

Cossar-Ewart—Schafer.—Dec. 24, at St. Michael's, Highgate. J. Cossar-Ewart, M.D., F.R.C.S., Regius Professor of Natural History Aberdeen University, to Jessie, elder daughter of J. W. H. Schafer of Highgate.

## Deaths.

Archdall.—Oct. 21, at Murrumburrah, Australia, Thomas G. Archdall L.R.C.S.Ed.

Barron.—Dec. 25, suddenly, at St. John's, Woking, Edward Enfield Barron, M.D., of St. Thomas's Street, Borough, aged 67.

Browning.—Dec. 20, at Kildare Gardens, London, W., Geo. Browning M.D., aged 64.

Keenan.—Dec. 20, at Haslar Hospital, Constantine Keenan, L.R.C.S., Fleet Surgeon.

Nicaols.—Dec. 22, at his residence, Surrey Street, Norwich, W. F. Nichols, F.R.C.S., aged 77.

Stocker.—Dec. 25, at Burnham, Bucks, of acute pneumonia, James Stocker, for many years Registrar and Secretary to Guy's Hospital aged 74.

Thomson.—Dec. 13, at Albany Place, Plymouth, Mitchell Thomson, Fleet Surgeon (on the Retired List), aged 74.

Wills.—Dec. 23, at Commercial Road, Landport, Douglas Wills, M.D.

## THE DENTISTS ACT.

AN ACT TO AMEND THE LAW RELATING TO DENTAL PRACTITIONERS, 41 & 42 VICT., CH. 33.

[JULY 22, 1878.]

*(Continued from our last).*

21. *Continuance of Examination by R. C. S of England.*
22. *General Council may require from Medical Authority information as to Examinations.*
23. *Representation to Privy Council of Defects in Examination.*
24. *Powers of Privy Council.*
25. *Consequences.*
26. *No Restrictions as to any Theory of Dentistry by Bodies entitled to grant Certificates.*—If it appears to the General Council that an attempt has been made by any medical authority to impose on any candidate offering himself for examination an obligation to adopt or refrain from adopting the practice of any particular theory of dentistry or dental surgery as a test or condition of admitting him to examination, or granting a certificate of fitness under this Act, the General Council may represent the same to the Privy Council, and the Privy Council may thereupon issue an injunction to the authority so acting directing them to desist from such practice, and in the event of their not complying therewith, then to order that such authority shall cease to have power to confer any right to be registered under this Act so long as they continue such practice.
27. *A Dental Licence not a Medical Qualification.*—A certificate under this Act shall not confer any right or title to be registered under the Medical Act, 1858, in respect of such certificate, nor to assume any name, title, or designation implying that the person mentioned in the certificate is by law recognised as a licentiate or practitioner in medicine or general surgery.
28. *Provision for Conjoint Examination (not at present applicable.)*—The General Council shall have the same power of making rules respecting the examination of persons desiring to obtain certificates of being qualified to practise dentistry or dental surgery as they have for the time being in respect of the examination of persons desiring to obtain a qualification to practise medicine and surgery, and there shall be the same right of appeal to the Privy Council against such rules.

The General Council and the Privy Council shall have the same control over the medical board, so far as regards the examination of persons desiring to practise dentistry or dental surgery, as they have as regards the examination of persons desiring to practise medicine and surgery, and shall have the same power of dismissing the members of such board.

The General Council may cause to be framed, and may approve, and when approved, submit to the Privy Council, a scheme to carry into effect the provisions of this Act with respect to a medical board, and rules respecting examinations, and for extending, with or without an exception or modification, to the examination of persons desirous of practising dentistry or dental surgery, the provisions of any Act for the time being in force with respect to the examination of persons desiring to practise medicine or surgery, and any such scheme when confirmed by the Privy Council shall have full effect.

Any such scheme may provide for the fees to be paid on admission to the examinations, and for the application of such fees for public purposes, and generally for such matters as appear to be necessary or proper for carrying into effect the scheme and regulating the examinations.

*Supplemental.*

29. *Evidence of Registration.*
30. *Exemptions of Registered Persons from Jury Service, &c.*—Every person registered under this Act shall be exempt, if he so desires, from serving on all juries and inquests whatsoever, and from serving all corporate, parochial, ward, hundred, and township offices, and from serving in the militia; and the name of any registered person shall not be returned in any list of persons liable to serve in the militia or in any such office as aforesaid.
31. *Exercise of Powers by Privy Council.*
32. *Application of Fees.*
33. *Accounts to be Published.*
34. *Penaly on Wilful Falsification of Registers.*
35. *Penalty for obtaining Registration by False Presentations.*—Any person who wilfully procures or attempts to procure himself to be registered under this Act, by making or producing, or causing to be made or produced, any false or false or fraudulent representation or declaration, either verbally or in writing, and any person aiding and assisting him therein, shall be deemed guilty of a misdemeanour in England and Ireland, and in Scotland of a crime or offence punishable by fine or imprisonment, and shall, on conviction thereof, be liable to be imprisoned for any term not exceeding twelve months.
36. *Notice of Death of Practitioners.*—Every registrar of deaths in the United Kingdom, on receiving notice of the death of any person registered under this Act, shall forthwith transmit by post, to the registrar of the General Council and to the registrar of the Branch Council for that part of the United Kingdom in which the death occurs, a certificate under his own hand of such death, with the particulars of time and place of death, and may charge the cost of such certificate and transmission as an expence of his office.
37. *Provision for certain Students.*—Any person who has been articled as a pupil and has paid a premium to a dental practitioner entitled to be registered under this Act in consideration of receiving from such practitioner a complete dental education, shall, if his articles expire before the first day of January one thousand eight hundred and eighty, be entitled to be registered under this Act as though he had been in *bonâ fide* practice before the passing of this Act: Moreover, it shall be lawful for the General Council by special order to dispense with such of the certificates, examinations, or other conditions for registration in the Dentists Register required under the provisions of this Act, or under any bye-laws, orders, or regulations made by its authority, as to them may seem fit, in favour of any dental students or apprentices who have commenced their professional education or apprenticeship before the passing of this Act.
38. *Bye-laws.*

39. *Services of Notices by Post.*
40. *Recovery of Penalties.*

## THE SCHEDULE.

DECLARATION required to be made by a person who claims to be registered under the Dentists Act, 1878, on the ground that he was *bonâ fide* engaged in the practice of dentistry at the date of the passing of the Dentists Act, 1878 :—

I, , residing at
hereby declare that I was *bonâ fide* engaged in the practice of dentistry at
, at the date of the passing of the Dentists Act, 1878.

(Signed)
(Witness)
Dated this day of , 18 .

NOTE.—Any person who wilfully procures or attempts to procure himself to be registered under this Act, by making or producing, or causing to be made or produced, any false or fraudulent representation or declaration, either verbally or in writing, and any person aiding and assisting him therein, is liable, under the Dentists Act, 1878, to imprisonment for twelve months.

## VACCINATION.

THE following is part of a letter from the Local Government Board read at the last meeting of the Mallow Union :—

"Dr. MacCabe draws attention to a matter which seems to the Local Government Board to demand the most serious and prompt consideration of the board of guardians, namely, the state of public vaccination in the union. The children in the workhouse school are of course collected from all parts of the union, and if the state of vaccination amongst these children, as described by Dr. MacCabe, is to be accepted as an indication of the general state of vaccination throughout the union, it would appear to be extremely unsatisfactory. On the day of Dr. MacCabe's inspection he examined the arms of all the children in the schools with the view of ascertaining to what extent they were protected against the danger of contracting small-pox. 68 children were examined with the following results :—Presenting 3 vaccine cicatrices, 1 : presenting 2 vaccine cicatrices—typical, 10; fair, 10 ; bad, 1 ; presenting 1 vaccine cicatrix—typical, 6 ; fair, 17 ; bad, 7 ; presenting no trace of vaccination, 16 ; proportion per cent. unprotected on day of inspection, 33·6. And Dr. MacCabe observes that the proportion is really larger, because the seven children presenting one bad mark must be considered to a great extent as unprotected. The Local Government Board request the guardians to call the immediate attention of the workhouse medical officer to the cases of the children in question with reference to the provisions of Article 68, No. 6 of the workhouse rules, which declares it to be part of his duty "to vaccinate such of the children as may require vaccination." The guardians should also call upon the several dispensary officers in the union to ascertain the names of all the children in their respective districts who are at present unprotected from the contagion of small-pox ; and proceed at once to vaccinate such as are fit for the operation. It is scarcely necessary for the Local Government Board to remind the guardians of the pressing importance of having the provisions of the Compulsory Vaccination Act rigorously enforced, having regard to the fact that in some rural as well as urban districts in Ireland small-pox has now assumed an almost epidemic form."

## COMMON LODGING HOUSES.

THERE is no part of the Public Health Act (says the *Ballina Herald)* likely to be more useful than that which prescribes regulation and inspection for common lodging houses. In Ballina we were well aware of the existence of many tenements used as common lodging houses in which the lodgers were literally herded together without regard to the separation of sexes or otherwise—loathsome dens, which could not be clean, or free from disease and other evils. Seemingly, there was no authority authorised, or at least willing, to enter these haunts and condemn or improve them. It is true the Town's Improvement Act prescribes regulations for common lodging houses, but this provision, like so many other provisions of that enactment, has been allowed to lie in abeyance, and few persons have ever heard of it. It may be that the provision is not an adequate one, or that it would be difficult or expensive to bring it into force. This would go to account for the indifference of the Town Commissioners to a matter really of the first importance. Now, however, the oversight and regulation of common lodging houses appear to be taken altogether out of the hands of Town Commissioners and to be reposed in the hands of Sanitary Boards, and the change is already bearing fruit. The Ballina SanitaryBoard had on Saturday before them lists of lodging houses which, in the opinion of the sanitary sub-officers, call for inspection and report on the part of the medical officers of the Board. The lists, it is true, are meagre, and only extend to a few streets or lanes ; but a commencement has been made, and we hope to see it promptly followed up. All the common lodging houses should be registered and be subject to inspection and control by the Sanitary Board. By this means only can the number of lodgers in each be kept within due bounds, and can pure, cleanly, and healthy existence in them be secured.

## THE KILBEGGAN DISPENSARY COMMITTEE.

IT will be remembered that recently a sworn investigation was held by the Local Government Board Inspector into certain charges of neglect brought against the medical officer of the Kilbeggan dispensary district. The result of the inquiry was that the Local Government Board directed the dispensary committee to call upon the medical officer, Dr. James B. Barry, to resign. However consistent this decision may have been with the evidence, it certainly did not meet with general approval, and a memorial bearing the signatures of many influential gentlemen, and those of seven membere of the dispensary committee, was forwarded to the Local Government Board, praying that this body would not insist on the removal of the medical officer. We are happy to learn that the Local Government Board has decided not to call for Dr. Barry's resignation.

## ATHY UNION.

### THE MEDICAL OFFICER AND THE LOCAL GOVERNMENT BOARD.

THE following letter was read :—

"Local Government Board, Dublin,
"17th December, 1878.

"Sir,—The Local Government Board for Ireland acknowledge the receipt of minutes of proceedings of the board of guardians of Athy Union on the 11th inst., relating to the payment proposed to be made to Dr. O'Neill, medical officer of the workhouse, for his services in attending cases of small-pox. In reference thereto the Local Government Board desire to state that they are prepared to afford the guardians all the co-operation they can in making due provision for meeting the epidemic with which the union has been visited. But as regards the proposed payments to officers already under salary, it will be, the Board consider, the best and most reasonable course to assign special compensation to them when the full amount of the duties performed by them respectively can be accurately ascertained.—By order,

"B. BANKS, Secretary."

Chairman—I think the Local Government Board is right; the guardians were altogether too liberal.

Mr. D. Whelan—I do not at all agree with you. Dr. O'Neill has lost nearly all his private practice.

Mr. Lefroy—I am only speaking for myself, but I do not think we can take Dr. O'Neill's private practice into our consideration at all.

Mr. Whelan—But Dr. O'Neill tells you he has no right to attend the auxiliary hospital at all.

Mr. Lefroy—That is an entirely different matter. If he has no right to attend he ought to be remunerated. Suppose we had built an addition to the fever hospital, Dr. O'Neill would have to attend all patients in it. But by all means comply with the doctor's wish.

Mr. Whelan—I propose that we adhere to our resolution

An amendment, that the Local Government Board be requested to inform the guardians whether, having regard to the terms of the medical officer's appointment, he is bound to attend the patients in the auxiliary hospital, was declared carried.

### SPREADING THE SMALL-POX.

The Monastereven relieving officer reported that a man named Andrew Geraghty, from Passlands, Monastereven, was admitted into the house suffering from small-pox.

The Master said the man walked into his office and handed him a ticket for admission, at the same time remarking very coolly that he had small-pox.

Chairman—Can the relieving officer give us any information?

Relieving Officer—The man was in a lodging-house, and the police were told about him having small-pox, and two of them went to the lodgings and ordered him out, and marched mim out of the town, and he then walked to Athy.

Chairman—That certainly is an extraordinary statement I suppose that man went into a dozen houses on his way from Monastereven to Athy, and sat down and smoked pipe.

The Master read a certificate from the dispensary medical officer to the effect that the man was suffering from small-pox.

Mr. Lefroy—By what authority did the police interfere with the man at all? They have no right to go near him without a magistrate's order.

Mr. O'Beirne—I would like to know if the doctor's responsibility ceases the moment he gives a certificate. In this case the relieving officer should have been communicated with at once.

Chairman—A statement should be at once sent to the doctor and the sub-inspector of constabulary, and an explanation asked for.

This course was adopted, and the clerk received instructions accordingly.

### SMALL-POX IN STRADBALLY.

Dr. Percival reported a case of small-pox in a place called Mullin, close to Stradbally. The patient was a girl named Mary Hinds, and the case being of a bad type, she was unfit to be removed to hospital.

The relieving officer said he had, in accordance with the doctor's instructions, sent half a pint of brandy to the patient's house.

After a due consideration of the case, the guardians granted 5s. per week as outdoor elief to the family, who were represented to be in a destitute state.

### THE WORKHOUSE BESIEGED.

During the sitting of the board between fifty and sixty men of the labouring class assembled outside the board-room, and it was mentioned by one of the guardians that as he passed in he heard the men threatening to break into the board-room. As some of the guardians were leaving to attend a meeting in the town-hall, they were surrounded by the men, who clamoured for relief or work.

Mr. R. T. Lefroy addressed them, and said the guardians and the people of the town were doing all in their power to relieve their necessities, but that none of them or their families could actually want, for they could all come into the house. One of the men asked were they to be compelled to break up their homes and become paupers when they were willing to work if they could get employment?

Mr. Lefroy—There is no necessity. You can lock up your doors and come into the house for a week or two until the weather breaks, and then you can go back again.

### SPECIAL REMUNERATION FOR SMALL-POX SERVICES.

The following letter was read:—

"Local Government Board, Dublin,
10th Delember, 1878.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of minutes of proceedings of the board of guardians of Athy Union on the 4th instant, containing a resolution proposing to pay a sum of £20 to Dr. O'Neill, medical officer of the Athy workhouse, for his past services in attending cases of small-pox, and to pay him at the rate of £1 per day for attending patients at the auxiliary hospital; and in reference thereto the Local Government Board desire to state that when the present epidemic has disappeared there would be no objection to the guardians awarding some special compensation to the medical officer for his services in attending cases of small-pox. The amount of extra remuneration now proposed for Dr. O'Neill's services in connection with the auxiliary hospital is in excess of the amount which has been paid for similar services in other unions. —By order of the Board. "B. BANKS. Sec."

Dr. O'Neil—Not wishing to be left at the mercy of the Local Government Board, I would desire that the guardians would appoint an assistant medical officer, as I feel myself totally unequal to discharge the duties at present devolving on me. I have of late been obliged to give up my private practice altogether. I have no confidence whatever in the Local Government Board.

Mr. D. Whelan—Have you no confidence in the board of guardians?

Dr. O'Neill—I have every confidence in the board of guardians, but I see the Local Government Board are over-riding the board of guardians, and I do not wish to be left at their mercy.

Chairman—I think the letter of the Local Government Board is very unsatisfactory, as they do not say one thing or the other. I was not here on last board-day, but I consider the additional remuneration awarded to the Doctor is most reasonable.

"Resolved—That the board are quite satisfied with the vote of remuneration proposed to be paid to our medical officer by the board of the 4th inst., and are determined to adhere to it."

## SMALL-POX.

### TRAFFIC IN SECOND-HAND CLOTHES, ETC.

THE following report was read from Dr. M'Dowell, Medical Officer of Health for Carlow:—

"I hereby report to you that from information obtained from the Royal Irish Constabulary, and the result of an inquiry conducted personally, I found that many parties are in the habit of trading between here and Athy in the matter of wearables, such as clothes, and provisions of various sorts, as also in fowl. I consider such practices dangerous to the public health, and likely to spread infection of small-pox, and I recommend that each and all so trading be prohibited from doing so for a specified time, and be warned of the penalty of exposing infected garments, &c., and the punishment attached thereto after receipt of proposed prohibition."

The Board considered it would be very desirable to have the law fully enforced in this matter, and ordered steps to be taken.

At the meeting of the Athy Guardians the Clerk read the following report:—

"Auxiliary Hospital, 10th December, 1878.

"SIR,—I beg to report that every evening up to Sunday last clothes, beds, &c., are being brought here for the purpose of disinfection at hours varying from 6 p.m. to 10.30 at night, causing a noise and great uproar in the place, awakening the poor patients who are just beginning to slumber after the day, and causing general confusion. Again, the way these things are brought is in my humble opinion a fruitful source of spreading the infection. They are all loaded upon an ass's car without anything to cover them, and infected clothes coming in such a state for miles from the country, and through the town, must leave the disease on every side as they come along. The carrier brings me no account of what he brings in, and as it is usually so late at night I have no means of ascertaining what he has brought, so that I will not hold myself responsible for anything that has been brought up to this. The clothes, &c., are here, but I do not know to whom they belong, except in one or two cases, and I do not know what articles belong to each. If proof were required for the assertions I have made that the clothes being conveyed here in an open car is dangerous, I may mention that the carrier's two sons have had the disease during the week, and I believe one of them has died. I beg to add that some of the bed-ticks that have been brought here are scarcely worth one penny; they are patched-up things, worn almost to shreds, and containing nothing but a few handsful of straw.—I am, sir, your obedient servant,

"ROBERT WALKER."

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING DEC. 21, 1878.

Deaths from zymotic diseases are above the average, but affections of the respiratory organs continue to be the chief causes of the excessive mortality, the deaths from these diseases again numbering 87, being more than double the average number (40) in the 51st week of the ten years 1868—77; they consist of 69 from bronchitis, 9 from pneumonia, 1 from asthma, and 8 from lung disease unspecified. The mean temperature for the week was nearly 5 deg. Fahr. below freezing point, being 13 degrees lower than the average for the corresponding week of the last ten years, and it may be here mentioned that in addition to 32 deaths amongst the old from bronchitis and other diseases, the returns include 25 deaths of persons aged 65 years and upwards, which were ascribed to "infirmity" or "old age."

Forty-six deaths from zymotic diseases were registered, being 14 more than in the preceding week, and 15 over the average for the 51st week; they include 15 from small-pox, 12 from fever (2 typhus, 7 typhoid fever, and 3 simple continued fever), 4 from scarlet fever, 3 from whooping-cough, 2 each from diphtheria and diarrhœa, 1 each from measles, croup, erysipelas, dysentery, &c.

The deaths from small-pox are 7 over the number in the previous week, and the hospital returns show a serious increase in the new cases of that disease, the number admitted during the week being 82, or double the number in the week ending the 14th inst. The new cases of scarlet fever admitted into the principal hospitals are similar in number to those for the preceding week, but there has been a further decline in cases of typhus and typhoid fever.

Thirteen children died from convulsions.

Phthisis caused 20 deaths, mesenteric disease 6, hydrocephalus 2, and cancer 3.

## ON THE SELECTION OF AN OPERATION FOR STONE IN THE BLADDER.(a)

By W. F. TEEVAN, B.A., F.R.C.S.,

Surgeon to the West London Hospital, Surgeon to St. Peter's Hospital for Stone in the Bladder, &c.

THE subject which I have chosen is one of the most important that can engage the attention of the operator, and in the whole range of surgery I know of nothing which requires so great an exercise of the surgeon's judgment as to arrive at a correct decision in certain cases as to whether a stone should be crushed or cut out. We cannot apply a hard-and-fast line in making a selection, and each case must, after all, be judged by its special features—that which may be right in one case may be very wrong in another. Then, again, that which may be permitted to one surgeon must be denied to another. An operator who has only had some half-dozen cases of crushing is not justified in being as bold as one who has had half a hundred. It is not my intention to discuss, or institute a comparison as to, the relative merits of cutting and crushing in a case eligible for either operation. I hope that that question has long ago been looked upon as settled. I take it for granted that we all admit that lithotority ought, if possible, to be performed in preference to lithotomy. What I propose for consideration is—Firstly, what are the conditions in doubtful cases which should guide us in selecting one operation rather than the other; and, secondly, if the stone is to be cut out, which is the best method of doing it. I consider that in a boy up to 15 years of age the question of crushing cannot arise, and that the question of cutting cannot be entertained in the case of a man with a small stone and healthy urinary organs. It is to the border land between lithotomy and lithotrity that we must adjourn, and determine into which camp we must send the dwellers therein. I will, seriatim, discuss those conditions which present themselves for consideration. It rarely happens that the choice can be dependent on any one factor, and it is rather by the collective testimony evoked by the "yes" or "no" answers furnished by interrogating each condition that we can best come to an accurate decision. We may, indeed, regard the factors in the case as so many jurymen, and the verdict is to be sought in the answer given by the majority of them.

*Sex.*—Neither operation is barred by sex. The female is specially favourable for lithotrity; in her the urethra is short, straight, and capacious, and I am sure that many cases of stone would have been better disposed of by crushing than extracted by the so-called process of forcible dilatation, which is complete rupture, and is occasionally followed by incontinence of urine.

*Age.*—Up to puberty in the male, crushing is not eligible, because the parts are too small for a successful performance of lithotrity; it is feasible, but not desirable. In the female child the question of crushing may be entertained, because there is virtually no urethra to interfere with the introduction of instruments, or the escape of fragments.

*Size of Stone*—It is quite impossible to fix with mathematical precision the size of the stone which may not be crushed. The general opinion of surgeons would be, I think, that it is not desirable to crush a calculus which is more than one inch and a half in its longer diameter. No doubt, if the stone be phosphatic a larger one may be tackled; at the same time the conditions present in such a case are not so favourable for lithotrity as when the calculus is of uric acid. I have successfully disposed of a phosphatic stone, $1\frac{3}{4} \times 1\frac{5}{8}$, in sixteen sittings, in a man twenty-eight years old. I also completely removed a phosphatic calculus, $2 \times 1\frac{3}{4}$, in twenty-six sittings, in a patient forty-five years old, but I was unable to cure the cystitis which existed before the operation and continued after it, and one year later I had to perform cystotomy, which cured the sufferer.

Experience shows that any stone not exceeding one inch in its longer diameter can be completely removed in about half a dozen sittings at the outside. The objection to crushing large phosphatic calculi

(a) Read before the Medical Society of London.

is that the sum total of all the sittings would be extended over so many weeks that the patient would be worn out by the cystitis that usually arises if the stone is not rapidly got rid of. Hence, regarding the size of the calculus that may be crushed, a certain amount of vagueness must still exist. We cannot fix the dimensions with mathematical accuracy, and we must be content to use the word "about."

*The Number of the Calculi.*—It must be admitted that we cannot diagnose the existence of more than three stones. The lithotrite can grasp one of them, and the surgeon can then, by turning the instrument first to one side and then to the other, discover if there be a calculus in each position. A number of small stones may be regarded as the fragments of a crushed stone. If, however, there were three calculi, each larger than three-quarters of an inch, the case would not, I consider, be eligible for lithotrity—not on account of the size, but for reason of the quantity of the material, contained in the three stones, necessitating a great number of sittings for removal.

*The Patient's Health.*—It would not, I think, be right to operate in a case where the patient's health was so broken that there was not a fair chance of success, unless, indeed, there was extreme suffering. Such an instance must, however, be extremely rare. Out of nearly one hundred cases of stone in the bladder, I have operated in every case save one, where there was softening of the brain.

*The Condition of the Kidneys.*—Much stress has been laid by most writers on the state of the renal organs. I would venture to say that it ought to be disregarded, unless in a case where there would apparently not be much chance of the patient living beyond a few weeks. We do do not as yet know the maximum amount of kidney disease compatible with life, nor has any one as yet been able to prove that a patient with renal disease has a better chance of recovery after a cutting operation than a crushing one. Some surgeons say that a man with kidney disease has a better chance of recovery after lithotomy than lithotrity, but it is only a "say," and must be treated as such: it is not a fact. I consider that renal disease is no bar to either operation, but rather an indication for surgical interference. It is usually secondary to the bladder trouble, and kept up by it, so that the only way to lessen or remove it is to take away the cause. Kidney disease is a thing to be expected as a concomitant of stone, just as it is in stricture of the urethra; and I consider it cruel to refuse to operate simply because the patient has renal disease.

*The State of the Bladder.*—A sacculated bladder would, in my opinion, preclude lithotrity, because it is by no means easy to get rid of the *débris*, the chances being that a small piece will elude the lithotrite, cause great discomfort, and finally constitute the nucleus of a fresh stone. It may be said that the bladder can be washed out. If, however, the sacculus be small, this is almost impossible; and it must be borne in mind that washing out the bladder is more trying than a crushing, so that cystitis is very likely to be set up by the combined manipulations. The atonic bladder is no bar to lithotrity, because there is a very fair chance of getting rid of the fragments by washing them out, provided the bladder is not sacculated. There is a condition of bladder which does not seem to have received much notice from writers. I refer to cases in which the bladder will hold very little urine—where, indeed, it is chronically and permanently thickened from long-continued irritation. Now if, in such an instance, we introduce the lithotrite, we shall find that we can only open the blades for a short distance, that we are arrested at every turn in our exploration, and that if we do get hold of the stone we do not fairly grasp it; the instrument only nibbles at it, and fails to embrace it properly, not for reason of its size, but because there is not room enough for the blade to open. Such a case is eminently unfavourable for lithotrity, not because we cannot break the stone, but because the manipulations and explorations requisite for removing the last fragment cannot be successfully carried out—the lithotrite, indeed, not being able toget at the enemy. If, therefore, I had examined a patient with the lithotrite, whilst he was under the influence of ether, and found that my manipulations were arrested at every turn, I would at once relegate such a case to lithotomy.

*The State of the Prostate.*—An enlarged prostate is no bar to crushing, provided it does not interfere with the explorations of the lithotrite. It occasionally happens that both lateral lobes are enlarged posteriorly, projecting into the bladder like tumours, and so seriously interfering with exploration. Such a condition precludes lithotrity.

*The Condition of the Urethra.*—Stricture does not exclude crushing, as it is usually remediable. One case of mine was complicated by a tight stricture. I performed internal urethrotomy, and a fortnight afterwards commenced to crush the stone. No case could have done better. In some instances the urethra is horribly sensitive; but such a condition is generally overcome by the occasional introduction of an ordinary bougie.

*Idiosyncrasy.*—There are a certain number of subjects who, whenever an instrument is introduced into the bladder, suffer from rigors and great prostration of strength. If such patient present themselves to our notice, and if, after several introductions of a soft instrument at intervals, rigors persistently occur, such constitutional disturbance bars the operation of lithotrity, unless, indeed, the stone be so small that it can be disposed of in one or two crushings. I regard the occurrence of shivering after the passage of a sound as an evil omen, and indicative of structural change in the kidneys. If rigors occur after each crushing, and cystitis be induced, the patient will probably succumb. It will thus appear that although one condition taken *per se* is not usually enough to determine which operation shall be performed; yet if we interrogate each of the conditions as set forth, we shall not often have any difficulty in deciding. But if there should be any doubt as to which operation should be done, then most certainly the patient ought to be cut, for a very grave risk will be encountered if we crush where we ought to cut. The following case will sometimes present itself:—A patient has a stone which is quite within the range of lithotrity, but is complicated by the presence of a stricture and atony of the bladder. In such an instance lithotrity, pure and simple, ought not to be done. If the stricture demands an operation, it would be better to dilate the contraction sufficiently for the lithotrite to pass. I then break up the stone completely, and immediately perform external urethrotomy, thereby dividing the stricture and extracting the fragments at one and the same time. Such a combination I carried out on a patient, sixty-five years old, suffering from asthma, emphysema, chronic bronchitis, albuminuria, atony of the bladder, and stricture. He made a capital recovery. When an enlarged prostate is associated with atony of the bladder, the stone had better be completely crushed, and the fragments removed by external urethrotomy.

So much for the conditions which may influence us in determining whether the patient's stone ought to be crushed or cut out. Now, supposing the stone ought *not* to be crushed, what is to be done? Some would say that there is nothing left but to cut it out. My answer is—By no means necessarily so. All experience in lithotrity goes to prove that the objection to crush a large stone depends not so much on its size as upon the number of sittings requisite to crush it, entailing a great chance of setting up a cystitis by no means remediable. That is to say, the stone may be crushed, but the cystitis, if existing at the time of the operation, is likely to be made permanent, or if there were none, one may be lit up as it were. Experience, moreover, shows that if a calculus can be completely disposed of in one sitting no cystitis will be occasioned, or if it existed at the time of the operation it will subside as soon as the stone is completely removed. Mr. N. Bigelow has lately proved that even a somewhat larger stone than we should tackle here may be completely broken up and disposed of at one sitting by means of a

large evacuating catheter. In Paris we all know that Dolbeau established perineal lithotrity as a set operation.

Lithotrity and lithotomy have each their special advantages and disadvantages, and I consider that one of the objects of surgery will be in certain cases to utilise and combine the advantages of both operations. The special disadvantage of lithotrity is that it sometimes neither kills nor cures, and of lithotomy that it so often kills. Now it is well known that the risk attached to all operations is *ceteris paribus* entirely dependent on the extent of the cutting. That is to say, it is more dangerous to cut off a leg than a foot, and there is more risk attached to amputation of the thigh than the leg. It is precisely similar with lithotomy. The more extensive the cut or laceration the greater the risk, and the special danger of lithotomy is not infiltration of urine, which is a physical impossibility, but the opening of the great venous plexus surrounding the prostate. We know that the mortality after external urethrotomy is very small, whilst that after lithotomy is very great. Now, if we can reduce the stone to fragments of such a size that they can be extracted through the incision made in external urethrotomy it will be at once seen how greatly we shall also reduce the mortality after the operation. I am not aware that anyone but myself in this country has done the combined operation, but I am very pleased with the combination, and shall perform it wherever I consider it indicated. Therefore, in all cases where we are doubtful as to whether a patient ought to be cut or subjected to crushing, the combination of lithotrity with external urethrotomy presents itself to us for consideration. A stone of from one to two inches in diameter occurring in a man who has a stricture and an enlarged prostate or atonic bladder, ought to be crushed to pieces and then removed through an incision made into the perineal urethra, as in external urethrotomy. Most surgeons would say "Well, why not cut out the stone whilst you are about it?" I reply "No," for the simple reason that if you do lithotomy instead of external urethrotomy you diminish enormously the patient's chance of recovery. The mortality after external urethrotomy is small, whereas that after lithotomy is large, and this fact is all the more important because we have every reason to believe that the extent of kidney disease is far greater in cases of bad stricture than in stone in the bladder. The obstructive effects on the renal organs must be more serious in the former than the latter.

I presume that now-a-days no surgeon would ever think of cutting an adult male for stone unless he had previously examined the bladder with a lithotrite, and determined the size of the calculus. Such knowledge obtained by the instrument is hardly appreciated as it ought to be by the lithotomist. In past time all that surgeons could say about a stone was mere guess work; they could declare that they thought it big or small, but how big or small they knew not, and were consequently greatly in the dark as to the cutting operation they should choose. Now, however, thanks to the lithotrite, we no longer guess, but are able to state with mathematical precision the exact size of the stone. I have already said that boys are best cut for calculus, excepting always those cases of very small stones which can be disposed of in one crushing; for instance, suppose that a boy had a calculus impacted in his urethra, and that I could not extract it with the forceps; I would push it back into the bladder if possible, and there crush it, knowing that it must be very small. Now, which form of lithotomy is best adapted for boys? Most certainly the lateral. I have cut in all twenty boys, without a single death, performing the lateral operation in each case. The median method is not desirable in boys. Some years ago I performed a series of experiments on the dead body regarding the median operation, and I found that in that procedure the floor of the prostatic urethra is torn. The result of such laceration is that the orifices of the ejaculatory ducts are obliterated, and sterility follows. I consider we ought not to expose boys to such an infirmity—that we ought to cut through the neck of the bladder, and not lacerate it in the so-called process of dilatation of median lithotomy, which is in reality complete laceration. By performing a free lateral operation we spare the floor of the urethra, and avoid emasculating the patient. The occurrence of sterility after lithotomy is by no means infrequent, and is as yet an untrodden field for inquiry. Several years ago I brought such cases before the notice of the Clinical Society. So much for lithotomy in boys. Now for adults. The introduction of lithotrity has completely revolutionised lithotomy. In days gone by all calculi had to be cut out, and inasmuch as in hospital practice stone occurs about five times as often in boys as in adults, surgeons found on the whole that the lateral operation was a very good one. It did well for boys, it did well for small and medium-sized stones in the adult, and, as it was only now and then when a big calculus was encountered, they had no reason to find fault with the operation. Now-a-days, however, things are entirely changed. Our lithotomies are, or ought to be, for big stones. The small or medium-sized ones can be disposed of by crushing, and hence we only want a cutting operation for the removal of large calculi. I would at once say that the median operation cannot be even thought of. In lithotomy we have the choice of cutting the stone out or tearing it out; there is no such thing as dilatation of the prostate—we must either completely cut through the gland or tear through it, and I, for one, have no hesitation in saying that in lithotomy I would at all times rather cut than tear; you can limit your cut, but you never know where the laceration ends; therefore the median operation cannot be thought of. In lateral lithotomy it may be said the further the cut or laceration extends from the centre the more grave the operation becomes, for this reason—one gets nearer the peritoneum and the trunks of arteries and veins. The risk, therefore of peritonitis and hæmorrhage is increased. To remove a stone three ounces in weight the surgeon will have to cut or tear up to the left ureter, and cut or tear the rectum. Lateral lithotomy is applicable for stones that exceed one inch in diameter, but not exceeding two inche sand-a-half. For anything exceeding the latter measurement, the pre-rectal or recto-vesical operations are preferable. Now in what consists the advantage of these operations over the lateral? Firstly, the vessels are cut in their extremities rather than their trunks; hence the bleeding is not so severe at the operation; is not likely to recur, and can at all times be easily stopped, whereas in lateral lithotomy there is always a chance of secondary hæmorrhage until a fortnight is passed. I think every surgeon will confirm the remark made by Erichsen, that patients who lose a large quantity of blood during or after lithotomy, do not do well, for it so often happens that the operation is performed on diseased or debilitated subjects who ill bear the loss of much blood. Hence, the prevention of undue hæmorrhage is very desirable. Secondly, in them the operator does not penetrate so far into the pelvis. In the ordinary operation of lithotomy (lateral) I have ascertained that the cut or laceration usually extends up to the left ureter. It can be readily understood that incisions which do not extend beyond the posterior margin of the prostate are not so dangerous as those which reach to the ureters. Thirdly, whatever space the lateral operation can afford, the pre-rectal and recto-vesical will give exactly double; either of them is, indeed, equal to two lateral lithotomies put together. Erichsen observes of the pre-rectal operation, "that it has not received the attention from surgeons in this country that it deserves." The great advantage of the pre-rectal is that in it the rectum can scarcely be wounded, the vessels are cut in their terminal branches rather than their trunks, and that it affords double the space the lateral does. The extraction of a stone by the pre-rectal method closely resembles the descent of the child through the vagina. The pre-rectal operation is the favourite one in Paris, and with many American surgeons, and according to the statistics published in Gross' "Surgery" shows much better results than the lateral, the mortality after the former being 1 in 13·07 as against 1 in 9·11. For old men, or those who are very debilitated or diseased, I prefer the recto-vesical. Why do I do so? Because by it one is able to reach the

bladder with the minimum amount of cutting, and consequently it is the one operation which stands out as contra-distinguished to all others. In the three cases in which I did the operation, I was surprised at the small amount of blood lost. There is no necessity to make a tunnel to the prostate; the surgeon avails himself of one already existing—the rectum—and has merely to divide the thin septum intervening between it and the urethra. The objections made to the operation are two, but they cannot be sustained. The first one is the alleged liability of wounding the peritoneum. If the prostate be divided vertically, most certainly there is a slight risk, but if it be cut outwards and downwards on each side, there is no such chance of danger. Secondly, the occurrence of fistula. It must not be overlooked that the primary object in cutting for stone is the preservation of life, and that it is far better to adopt the safer of two methods, although it may leave some local annoyance. There is a well-known English adage to the effect that, "a live donkey is better than a dead lion;" and in illustration it may be said that it is far better for a man to recover with two holes in his rectum than die with one. One of the reasons why the recto-vesical operation fell into disuse was the liability to the occurrence of fistula after the operation; but it must be remembered that in those days fistula after operation was usually incurable. Now, however, all is changed, and a fistula after the operation can be cured with comparative ease and without risk to the patient, and it must be further borne in mind that a fistula after the recto-vesical operation is much easier to cure than one after lateral lithotomy, which is situated in a corner, and is often difficult to get at. From my own experience on the living and dead, and from my examination of all the specimens in the different museums in London, and from what I have seen of the experience of other surgeons and the cases which have come to me for relief on account of recto-urethral or recto-vesical fistula, I venture to say that it is not possible to extract a large stone by the lateral method without cutting or tearing the rectum.

The supra-pubic operation I would reserve for the removal of those enormous calculi which happily are very rare. According to Dulles, the results of the supra-pubic operation for stones over two ounces are far more favourable than the lateral method. Personally, I would prefer the recto-vesical for the extracting of an enormous calculus, breaking it up if I found its removal difficult.

The median operation I consider has a very limited field, and that in adults only. It is applicable for those cases of lithotrity in which we desire to supplement the crushing by a cutting operation, the stone being already reduced to fragments small enough to be extracted through a median incision, without cutting or tearing the prostate. I have tried the medio-lateral but I am not satisfied with it, as it does not give enough room. One word for cystotomy. It now and then happens that although lithotrity removes the stone it fails to cure the patient; that is to say, the cystitis, if existing before the operation, or set up in the course of the case, is not cured. Such instances are truly deplorable, and in this country are invariably left to linger and die a miserable death. I will relate two cases of lithotrity, as they stand out in marked contrast to each other, and illustrate the relative advantages of operation and leaving the patient alone.

A gentleman, æt. 64, suffered from a small stone the size of a hazel-nut, which was crushed by an eminent surgeon. The only thing which the patient complained of before the operation was that he passed a little blood, and experienced a little pain when he rode fast; the urine was quite clear. After the operation he became a confirmed invalid, through cystitus, which was set up by the operator's manipulations. He sought my advice. I examined him, but there was not a particle of stone in his bladder. I recommended him to be cut, in fact, to treat his bladder as a suppurating sac. After I had given my opinion he said he had consulted a distinguished physician, who advised him to be cut, whether he had a stone or not. He was dissuaded from following the advice given him by two surgeons, who told him he had too much kidney disease to survive the operation. He lived a miserable life for some months, and then died, worn out by suffering. The other case I have already alluded to; suffice it to say, that although I removed his calculus I could not relieve his cystitis. One year after the lithotrity I performed cystotomy on him, and completely cured him in three weeks.

Dr. Gouley, of New York, the professor of genito-urinary surgery at the Bellevue Hospital, has performed cystotomy on three patients, effecting a complete cure in each instance. It is therefore a consolation to think that in those wretched cases of cystitis persisting after lithotrity we have an effectual remedy in cystotomy. I am led to think that external urethrotomy, which is not quite so serious an operation, would answer equally well in these cases. In conclusion, I would sum up thus:—

1. Lateral lithotomy is specially indicated for the removal of all stones from males under puberty.
2. All calculi in men ought, if possible, to be crushed.
3. Stones on the border land between lithotomy and lithotrity may be well disposed of by lithotrity and external urethrotomy.
4. Calculi within the legitimate range of lithotrity occurring in patients suffering from some complication which precludes crushing, are best dealt with by lithotrity, followed immediately by external urethrotomy, in order to remove the whole of the stone at one sitting.
5. All calculi not exceeding one inch in the longer diameter ought to be crushed.
6. Phosphatic stones up to one inch and a-half in the longer diameter may be crushed.
7. Lateral lithotomy is specially indicated for the removal of calculi varying from 1½ inches to 2½ inches in their longer diameter.
8. Bi-lateral lithotomy is well adapted for the extraction of stones measuring from 2½ to 3½ inches in their shorter diameter.
9. The recto-vesical operation affords the most room for the removal of very large calculi, and is probably a safer method than supra-pubic lithotomy for such cases.
10. The median operation is only adapted for those cases in which lithotrity has failed, and the immediate removal of the fragments is required. A similar remark applies also to the medio-lateral method.
11. Small stones in females may be best extracted by forcible dilatation. If large, they had better be submitted to lithotrity, the female bladder and urethra being well adapted for performing lithotrity.

## OSSEOUS UNION IN FRACTURE OF THE PATELLA. (a)

By WILLIAM I. WHEELER, M.D., T.C.D.,

Surgeon to City Dublin Hospital; Lecturer on Clinical and Operative Surgery, Examiner for Letters Testimonial, R.C.S.

In the year 1873 I had the honour to bring before the Society a new apparatus for the treatment of fractures of the patella, induced to do so by the fact that a large number of fractures of this bone had come under my observation; and being a subject which had occupied the attention of the medical profession of late years, especially in Dublin, I shall not occupy the valuable time of this Society by entering into the forms of fracture occurring to this bone, or the diagnosis of such, or at length into the various means of treatment; these have been already epitomised in my paper (published in 1873) when introducing my splint for fracture of the patella and leg—then an untried apparatus.

As you may observe, it is a hollow wooden splint, extending from above the middle of the thigh to the

(a) Read before the Surgical Society of Ireland. The discussion will be found on page 25.

sole of the foot, at which point a foot-board is attached by means of a hinge ; this splint having two transverse bars, is fitted into a long box splint, in the sides of which it travels horizontally. That portion of the splint on which the limb rests can be elevated or depressed as required by means of perpendicular slots cut through the sides of the box splint. Thus the splint can be adjusted to suit a long or short leg ; the limb can be elevated or lowered at pleasure, and the foot placed at any angle. The hollow splint is fixed in position by means of thumb-screws, which fit into the transverse bars before mentioned. Two semi-lunar pieces of metal, softly padded, are fixed, one above, the other below, the fractured patella, by means of leather straps, which pass round the limb. The leg is secured to the splint by means of two broad web straps, one round the calf, the other at the ankle. The foot can be bandaged to the foot-board ; a roller with rack adjustment is fitted in the box splint below the foot-board. From this roller start four cords, which pass through brass sheaves, and are attached two to the upper and two to the lower metal pads by means of chains and light hooks. The roller is turned by means of a key, and, acting on the cords, causes the metal pads simultaneously to approach each other, thereby bringing the fragments into apposition. The rack is covered by a brass box, which can be locked, so that the adjustment of the splint cannot be interfered with by the patient.

Since the introduction of my splint (in 1873) it has been several times in use for transverse fracture of the patella. But I shall only allude to four cases treated by myself, three by Mr. Butcher, one by Mr. Tufnell, as I have not yet obtained full particulars of the other cases.

Mr. Butcher has written to me to say it fulfils all the advantages I have claimed for it.

Mr. Tufnell has promised me to relate his experience of it here to-night.

In the cases which I have treated I believe I have obtained bony union in each case, but can only affirm this positively in one case. The history is as follows :—

William Fitzgerald, æt. 21, by trade a milkman's driver and deliverer of milk, residing at 11 Church Lane, Donnybrook, was admitted under my care into the City of Dublin Hospital on the 13th September, 1875, suffering from transverse fracture of the patella of right limb. He states that when getting down off his milk-cart he knocked his knee against the wheel, and the accident thus occurred. There was considerable effusion into the joint, with separation of the fragments to the extent of 2⅜ inches.

I placed him on my own splint, elevating the foot and leg to the highest possible position the apparatus could place it in, and put pillows and a bed-rest behind his back, to throw the body forward. An ice-bag was applied over the joint, besides which it was fomented three times a day. The patient on admission was ordered aperient medicine, and in eleven days the effusion had sufficiently subsided to allow of the fragments being adjusted, which were brought together and kept in apposition by the pads already alluded to. The fragments were kept in perfect apposition. I need not go into daily details. Suffice it, on the 5th November a starch bandage was applied ; on the 9th he was up and walking about the ward ; he was discharged from the hospital on the 13th December. I watched the case with great interest to see if there would be any separation of the fragments, but they remained solidly together, notwithstanding he continued to follow his former avocations from a week after he left hospital. This, in my opinion, was a crucial test of the form of union between the fragments, for on an average this man got up and down out of his milk-cart over the wheel 440 times a week. Surgeons who saw this case and examined it stated they never saw such good and firm union in a case of fractured patella.

In the year 1877 he consulted me about a cough and wasting. On examination I found he had pulmonary phthisis, and prescribed for him with some advantage. Sufficient to say, I admitted him into hospital early in this year in advanced consumption. My colleague, Dr. H. Benson, kindly looked after him. Believing himself that change of air would do him good, through the kindness of Dr. Gordon I got him into the Whitworth Hospital, where he died two or three days after his admission. By thus constantly watching him from the time I observed the lung affection, and getting him to consent to go to another hospital when he desired change of air and thought it would do him good, I am enabled to lay before the Society a specimen of bony union of a transverse fracture of the patella, treated by my own apparatus, taken from a subject that had been discharged from hospital two years and five months previously.

This case was seen by Mr. Tufnell and Mr. Butcher with me before I adjusted the fragments, and by Mr. Colles after I had adjusted them some days. Professor Macalister has kindly examined and made a section of the specimen. I will read his report :—

Anat. Mus., T.C.D., Nov. 22, 1878.

MY DEAR WHEELER,—I have macerated and examined the patella you sent me. Having carefully cut it longitudinally I find it to be bony throughout. The medial half I have cleaned and removed from its back the articular cartilage. It is a perfectly continuous bone, and shows a ridge of new bony matter across the articular face.

The lateral half I have only slightly cleaned, but the union in it is very distinct and unmistakable. The sulcus at its upper and outer angle was filled by a mass of fibro-cartilage.

Faithfully yours,
ALEX. MACALISTER.

The next case is that of a young gentleman, æt. 19, who met with a transverse fracture of his right patella when coming down the hall door-steps of one of the high houses in the Pembroke Road. The separation was two and nearly a-half inches. The effusion was considerable. I placed him in my own splint. I was obliged to apply ten leeches over the joint, and ice-bags were kept applied for fifteen days. I then endeavoured to bring the fragments together, but he could not bear the pressure, and it was not till the 19th day after the accident I could adjust the fragments. It is now one year, three months, and thirteen days since the accident. He has since been playing at football, lawn-tennis, and cricket. The union is as firm and solid as that of Fitzgerald's. I believe it to be bony.

The other cases are both perfectly united. The subject of one is a labouring man, about 55 years of age, who is suffering from cirrhosis of his liver. It is possible I may get his patella yet. The fourth case is still wearing a bandage.

The observations which I have accurately made in my own cases, and in those treated by others, where I had the opportunity, do not coincide entirely with the axioms of Mr. Jonathan Hutchinson.

26. The quadriceps did not become thin and weak in Fitzgerald or in Mr. H. The measurements of the limbs corresponded ; in fact, the circumference round the thigh above the patella of Mr. H., is a quarter of an inch greater on the fractured than on the other side.

27. There was no rigidity of the upper fragment in three cases I have treated. The patella moved freely in its entirety, when the knee is flexed, at the will of the patient, and without diminished action.

10. I have frequently observed spasmodic action of the quadriceps during examination, and this not within the first few hours after the accident, but several days.

11. I believe that patients can put the quadriceps into partial action at their will, but it is difficult to get a person suffering from transverse fracture to attempt it. My belief is formed, first, from careful observation, and secondly, by placing my hand over the muscle of the thigh I have felt the muscle contract.

13. The bringing down of the upper fragment has been influenced by position in every case I have seen but two, and that was when the quadriceps was antagonised by the ligaments of Barkhow being intact.

His 18th proposition: "That no proof has yet been afforded that transverse fractures of the patella, with considerable separation at the time, ever unite by bone." The specimen before you contradicts this.

The only way I can account for the great weakness and the complete atrophy of the quadriceps observed by Mr. Hutchinson, would be by altered blood or nerve nutrition to the muscle from the method of treatment, or that all his cases, being weak or ligamentous union, that the muscle not having a fixed point to work on, and the patient not exerting that limb in consequence as much as the other—in fact, sparing it—the muscle, from these two causes, becomes weakened and thinned. This is in a measure verified by a case that died of Bright's disease in the City of Dublin Hospital some year or two ago. The man had been treated for fractured patella by the late Professor Geoghegan. There was very close union, but ligamentous. He was five-eighths of an inch less round the circumference of the limb above the patella which had been injured, than the sound one, and he told me, although he had excellent use and strength of the leg, he did "not make so free with it as the other one."

I cannot agree in thinking that it would be desirable to apply electricity to the quadriceps extensor muscle, as suggested by Mr. Hutchinson, inasmuch as it would tend to produce spasm, even if his theory of wasting in the majority of cases is true. In conclusion, I will briefly state the advantages of this apparatus. I claim all the advantages of Malgaigne's hooks, without the objections; my splint provides for the position of the limb; Malgaigne makes no such provision. This apparatus will procure perfect coaptation of the fragments without penetrating the soft parts; without the pain and irritation frequently caused by the hooks. In several cases treated by Malgaigne's hooks, erysipelatous inflammation has endangered both the life and limb of the patient. It is superior to A. Cooper's method by drawing on both fragments, and can make well-maintained traction on the lower as well as on the upper fragment, as the case may require. This apparatus is so contrived that the traction is downwards and backwards, therefore no stretching can occur, no bulging of fluid between the fragments happens with this splint. It would be tiresome to enter into comparison with all the other contrivances for fractured patella. I will merely say that the treatment by position advocated by Mr. Hutchinson and Mr. Teale is not suitable for widely separated fractures of the patella. On some future occasion I hope to demonstrate the advantages of this splint in oblique fractures of the tibia.

A COURSE OF

# Clinical Lectures

ON THE

## PATHOLOGICAL ANATOMY OF THE LUNGS.

By Professor CHARCOT,

Physician to the Salpêtrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

(*Continued from last vol., page* 514.)

### IV.—(*Continued*). The General Pathological Anatomy of the Pulmonary Epithelium.

I. Let us consider the pulmonary epithelium: we shall see reproduced in it in acute inflammatory processes all the phenomena just described *à propos* of the endothelium. Let us take the example of acute or sub-acute broncho-pneumonia, and let us examine first the case where the disease is experimentally produced in animals, the analysis of the phenomena under these circumstances being more easy. One of the most simple processes for producing the alteration which causes it is, as you know, section of the pneumogastrics, or still better of the recurrent nerves in certain animals, the rabbit, for instance. You know that the lesion of the lung in such a case is analogous in almost all respects to broncho-pneumonia or lobular pneumonia in man, and I may say here that lobar or fibrinous pneumonia distinct in all respects from the preceding, has not hitherto been produced experimentally. Observers have long been occupied in producing this kind of broncho-pneumonia, in order to study anatomically all the phases of the morbid process. Amongst recent works published on this subject, I would cite those of M. Friedlander (Berlin, 1873, and *Virchow's Archives*, 1876), those of Dr. Dreschfeld, of Manchester (*Lancet*, Jan. 8, 1876), and lastly, those of Otto Frey, collected in a memoir published at Berlin in 1877.

Division of the recurrents in the rabbit adopted by Friedlander and Frey in preference to division of the pneumogastrics has the advantage of allowing the animals to live for a relatively long time. Thus, in seventy-two animals operated upon by Friedlander, twenty-six died from the first to the eighteenth day.

It seems well established, as Traube believed, that the origin of the pneumonia thus produced is, in some degree, altogether traumatic. The animals become incapable of closing the glottis, a circumstance which troubles them much at first, but to which they gradually adapt themselves. The mechanical cause of the pulmonary lesions is the introduction into the air passages, and even into the alveoli of foreign bodies; pieces of food and buccal mucus which are found in the air cavities at the autopsy, and in the cases where, after section of the recurrents, the animal has undergone tracheotomy, the fluid which flows from the wound into the interior of the trachea.

The following is a summary description of the principal results obtained by these experiments. When the animal dies before the end of the first six hours after the operation we find, in the alveoli, swollen epithelial cells tending to assume a spherical form; their protoplasm is thickened and granular. Their nuclei are strongly coloured by carmine. The cells thus swollen tend to detach themselves from the wall and to become free in the alveolar cavity. They are capable of becoming the seat of amœboid movements, and by their prolongations may incorporate with themselves neighbouring bodies, such as leucocytes.

The swelling which is produced, is not, according to the researches of Friedlander, a certain indication of the existence of an inflammatory process; it may in fact be observed in cases where there has been produced experimentally a simple œdema of the lung, either by causing capillary emboli, or by compression of the ascending aorta. Besides, according to Friedlander the simple contact of serum is sufficient to produce swelling of the cells, and the development of amœboid movements.

The scene changes when we examine animals who have died on the second or third day. One may then see, as it were, all the phases of the multiplication of the cellular elements by scission. It is not rare then to meet with plates with nuclei, one variety of the giant cells. Friedlander has figured one of these cells which had acquired enormous dimensions, and enclosed fragments of vegetable cells. The phenomena are similar when, as Dr. Dreschfeld has shewn, the irritative process is caused, not by section of the recurrents, but by the injection into the bronchial passages of a weak solution of nitrate of silver.

II. In all these acute or sub-acute broncho-pneumonias experimentally produced, as well as in those which are spontaneously originated, the phenomena of endothelial cellular proliferation show themselves almost always complicated in various degrees, by the presence in the respiratory canaliculi of products of fibrinous exudation, of leucocytes, and of migrated red blood corpuscles. Consequently, these products and these elements are always met with in the alveolar cavity, mingled with the elements which result from the epithelial proliferation. But there is one condition in which the scission and multiplication

of the cellular elements which takes place may be observed under more simple circumstances, that is free from the presence of the products of exudation.

Pneumonias of this last kind may be called *epithelial, par excellence*, or as M. Buhl names them *lungenentzundung desquamatives*. Such is, to take an example from the domain of experimentation, the case in chronic primary pneumonia caused in animals by the introduction into the air passages of dust suspended in the atmosphere, particularly metallic particles. These chronic experimental pneumonias, in some degree traumatic, have, as you know, their analogues in human pathology There exist, in fact, in man an entire group of pulmonary affections designated, since the writings of M. Zenker, *pneumonokonioses*, which are produced by the influence of this cause. It is a group which is not devoid of practical interest, and to which we shall some day draw your attention. For the present, I shall content myself with drawing from the history of the pneumonokonioses one episode, which I shall take from the domain of experiment. It occurred in some experiments undertaken in my laboratory on the guinea-pig. The head of the anima is placed in a bag filled with powdered red oxide of iron, and the neck of the bag fixed by a ligature round its neck ; it is seen to shake the bag constantly, and the dust which it contains is necessarily mixed with the air it breathes. The animal is only released at feeding time and during the night. Our aim in these experiments was to reproduce in the animal that form of pneumonokonioses called in man *siderosis*, which is produced, as M. Zenker has shown, in the practice of certain trades. The results we have obtained have been satisfactory, and the indication from some of them is as follows. I will draw you for the moment from clinical phenomena, which nevertheless are not without interest. We have found that the very fine metallic particles of the powdered oxide of iron penetrate under these conditions to the very extremity of the air passages, that is to say, into the respiratory canals themselves, where it is easy to demonstrate their presence from the fifteenth day of the experiment. A second result is, that the metallic particles are primarily situated in the substance of the cells of the pulmonary endothelium. Such of the cells as contain these particles are large and swollen, sometimes detached from the alveolar wall, sometimes still adherent. The particles are never stopped on the way at any point of the bronchial tubes, through the whole extent of which they must nevertheless pass. It results from our experiments that the foreign matter is always localised here and there in certain groups of neighbouring acini, that is in a lobular and not in a diffused form. At these points, in consequence of the accumulation in the alveolar cavities of swollen epithelial cells, and also in consequence of the thickening of the walls of the alveolus, there are formed small nuclei of lobular induration which in the fresh state are distinguished on the surface of a section illuminated by reflected light by an *ochre red* colour ; a circumstance which we may say in passing recals the macroscopic characters of the patches of pulmonary siderosis in man. Lastly, our experiments have enabled us to study the various phases of epithelial pneumonia in its purity, that is to say free from the admixture of productions of exudation. The fact is that the irritation produced in the cellular investment of the respiratory canaliculi by the presence in those cavities of metallic particles is not limited to those cells to which the particles are fixed. It extends to the neighbouring cells, and one may recognise there the whole series of successive modification on which I have previously insisted ; that is to say, swelling of the cell, the outlines of which become accentuated so as to show without any other preparation the divisions of this endothelial investment ; scission of nuclei, scission of the cell ; the formation of the plates with nuclei or giant cells. I would repeat that in this form of primary chronic epithelial pneumonia the various stages of scission and of proliferation are found free from all interference even accessory of the phenomena of exudation.

When the animal was killed, about two months from the beginning of the experiment, it was seen that the alveoli whose cavity was diminished by the thickening of their walls, were literally choked at certain points by the accumulation of swollen and desquamated cells, and this accounts for the existence of those small nuclei of induration which have just been noticed.

We shall leave here the account of our experiments, for our aim has been more especially up to the present time to show you an example of epithelial or desquamative pneumonia, free from all complication. I will only add that even in experiments prolonged up to the second month, we have never at any point seen the proliferated cellular elements undergo caseous degeneration ; and it may be particularly noticed that the experiments were made on the guinea-pig, an animal well suited to undergo caseous inflammatory lesions, under the influence of the action of various agents, and of the most pernicious causes.

I have said enough I think to justify one of the propositions which I put forward at the beginning of this lecture, viz., that alterations in the pulmonary epithelium take a considerable part in the production of certain inflammatory lesions of the pulmonary parenchyma, and that under these circumstances the epithelial cells behave themselves in the manner of the endotheliums.

It remains for me to show you how, under the influence of other morbid causes than those we have hitherto employed, this cellular investment may assume the morphological characters and even the properties of epithelium properly so-called. The *flat* cell which in the adult in the normal state, lines the internal wall of the respiratory canaliculus is there found replaced by a cylindrical epithelium or even by an epithelium formed of soft cuboid cells, conditions which reproduce, as we say, the characteristics of the fœtal state.

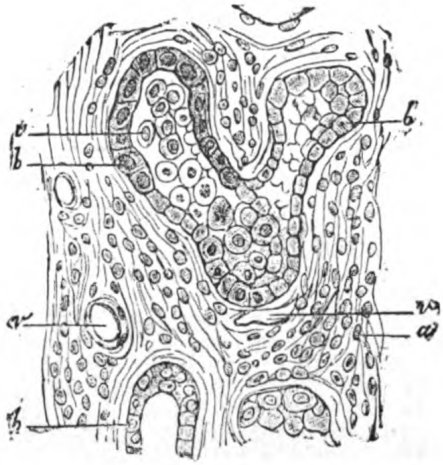
In support of what I advance I will first cite as an example certain instances of cancer of the lung in man, which have been especially studied by M. Mallassez, under the name *mucoid cancer*. The *stroma* of this cancer is constituted, as we shall see is the case in other forms of cancer of the lung, by the alveolar wall itself, not manifestly changed, and showing in every case its framework of elastic fibres still well marked. These walls appear lined by a continuous investment of cells which replaces the normal investment, which cells at certain points assume a cuboid form, whilst at others they are cylindrical ; sometimes there is only a single row of cells, sometimes there are many. These various dispositions may be met with at different points of the surface of a single alveolus. Besides cancer we shall cite also as an example the much more common case of the various sub-acute and chronic broncho-pneumonias. M. Thaon, in the fibroid pneumonia of tuberculous patients, has shown that the thickened alveolar walls in consequence of their transformation into embryonic or even fibrous tissue, are lined by an investment of cuboid cells which replace the flat epithelium. In the centre of the alveolar cavity there are usually found heaps of oval desquamated epithelial cells, the last vestiges of the former investment.

In the small nuclei of sub-acute or chronic pneumonia, which are frequently met with in syphilitic new-born children, there is seen, as MM. Cornil and Ranvier have shown (fig. 15), an absolutely identical disposition.

Under the name *carnisation*, Legendre (*Maladies de l'Enfance*, 1846, pp. 223), has described clearly an alteration in the lung, which, as I shall have occasion to show you, represents in the sub-acute or chronic state simple acute broncho-pneumonia. This alteration, which seems to me much more frequent than authors appear to admit, I have been enabled to study lately on a somewhat extensive scale, thanks to specimens obligingly sent me by my colleague, Professor Parrot, from the Hospital for Foundlings. It is very commonly observed, especially in very young children, where it is developed as a consequence of measles, whooping-cough, or even of a broncho-pneumonia. It occurs there in a pseudo-lobar form of broncho-pneumonia, that is to say, that the lesion occupies the greater part of a lobe, especially the lower, in its posterior part. The tissue of the lung at the altered

points, in the cases brought forward presents, according to the remark of Legendre, almost the colour and consistence of the tissue of the heart or of the gravid uterus. The surface of a section is generally uniform, smooth, and not granular; almost dry, or discharging only a small quantity of clear liquid. It appears usually, when attentively examined, marbled at certain points in consequence of the presence of acini or of groups of acini, which still show the changes of the acute form; this is often shown by septa, resulting from thickening of the inter-lobular connective tract. The indurated part is void of crepitation; it sometimes insufflates, but always very incompletely. Peri-bronchitis and dilatation of the bronchi are frequent accompaniments of this kind of alteration. This is one of the forms of cirrhosis of the lung, very distinct, as I shall show you in proper time from the fibroid pneumonia consecutive to prolonged lobar pneumonia.

FIG. 15.



Transverse Section of a Nucleus of Hepatisation.

*a*. Connective tissue of the lung in proliferation. *b*. Squamous epithelial cells disposed along the alveoli. *c*. Free spherical cells in the middle of them. *v*. Vessels magnified 300 diameters (Cornil and Ranvier, *loc. cit.* fig. 268, p. 710).

The great histological characteristic in the alteration, of which I have just recalled to you the chief macroscopic characters, is the combination of thickening of the alveolar walls which have undergone embryonic change with the existence of an epithelial investment no longer formed of flat but of cuboid cells. All this may exist, and habitually does exist, and this is an important fact to remember, without there being at any point of the lungs the least trace of caseous degeneration of tuberculous nodules. Is it not interesting to see in this sub-acute or chronic form of broncho-pneumonia, the walls of the pulmonary alveolus—which in embryonic development, arise from the *mesoblast*—take up again the embryonic character, at the same time that the epithelial investment—arising from the *hypoblast*—also retakes upon itself the form which it possessed in intrauterine life?

This remarkable circumstance in the history of chronic broncho-pneumonia, will appear to you doubtless still more interesting, when I shall have shown you that it is reproduced with absolutely the same characters in some varieties of intestinal inflammation or cirrhosis attacking other viscera than the lung. It is then, as you will see, not only a partial fact proper to the lung, but a general fact common to an entire group of visceral cirrhoses. I ask your permission, since it is worth the trouble, to enter upon some considerations to establish the proposition I have just laid down, and I shall endeavour to do this in the next lecture.

*(To be continued.*

# Clinical Records.

## A VISIT TO THE SURGICAL WARDS OF MERCER'S HOSPITAL ON NEW YEAR'S DAY.

ON the morning of the 1st of January the following were the cases under Mr. O'Grady's care:—

*Amputation of Thigh* (*a*).—Left limb of a lad, 10 years of age, removed close to trochanters for necrosis of femur. Stump healed well—the patient remaining under treatment for necrosis of the right tibia.

*Amputation of Leg* (*Three Cases*).

A. Woman, æt. 30, previously the subject of Syme's amputation at ankle. The circular operation on the leg was practised at the seat of election.

B. Girl, æt. 22, for disease of tibia, which necessitated the amputation at a very high point, with disarticulation of the fibula. To suit local emergencies, the procedure was a combination of the circular operation anteriorly with long skin flap posteriorly.

C. Woman, æt. 60, for a large chronic ulcer, circular operation. Stump healed in nicely, and patient is beginning to use an artificial limb.

*Amputation of Fingers* (*Two Cases*).

A. Severe mutilation of hand from gun-shot injury, man, æt. 55, the shattered remnants of ring and little fingers (left) removed at metacarpo-phalangeal articulation.

B. Middle finger, left hand of man, æt. 50, removed; also at metacarpo-phalangeal articulation for necrosis subsequent to diffuse inflammation following the bite of a pig.

*Hare Lip* (*Two Cases*).

A. In lad, æt. 12, associated with badly cleft palate. The lip had been twice operated on in early childhood by a surgeon, since deceased, and partial union obtained on the right side, the deformity of the protruding intermaxillary bones remained undiminished. The septum behind the protruding bone was divided, as well as the base of this latter, and the soft parts dealt with in the ordinary manner. A good result was obtained on this occasion.

B. Infant, 3 months old. Hare-lip single on left side, and complicated with protruding bone. Good union obtained.

*Sloughing Phagedæna of Penis.*—Man, æt. 26. Disease had been extensive, and attended with repeated and severe hæmorrhage. Nearly entire glans lost.

*Strumous Abscess* in connection with elbow and tarsus of a lad, æt. 12. Doing badly.

*Ulcers, Leg*, associated with large varicose veins, which had burst and given rise to severe hæmorrhage. Patient, a male, æt. 41.

*Hypertrophy of Tibia.*—Left side. Man, æt. 30, result of a kick from a horse three years previously. Improving under rest and cural treatment.

*Trismus* of some severity in a man æt. 50. Disease of a week's standing. No satisfactory history as to cause could be obtained; probably, however, resulted from exposure to cold.

*Compound Fractures* (*Three Cases*).

A. *Vide* gunshot injury of hand above.

B. In boy, æt. 3, severe smash of foot consequent on being run over by a float. Sloughing followed in parts, succeeded by wonderful repair.

C. Of right leg. Very bad; limb being extensively lacerated and laid open. Bone exposed for several inches. This severe injury occurred by the patient falling over a string tied across the footpath. The same limb had been the seat of bad compound fracture before. (*b*)

(*a*) During the previous month (December) were two other cases of thigh amputation.

(*b*) Leg had to be amputated below knee on 4th January.

*Supposed Fracture of Skull.*—In a man, æt. 30, who fell down a flight of stairs. He was insensible, with bleeding—the source of which could not be traced—from mouth and from right ear, with subsequently serdous discharge therefrom.

*Fracture of Femur (Two Cases).*

A. In man, æt. 70, sub-trochanteric on right side.

B. Also on right side in upper third, male, æt. 36. Subsequently complicated with pleurisy and bronchitis. Both patients treated with the Liston splint; the upper bandages being slackened for a time in the latter case.

*Fracture Leg (Eight Cases).*
*Of Both Bones (Five Cases.)*

A. Man, æt. 22, right leg. Tibia badly comminuted, fibula broken on level with upper fracture. Injury caused by collision with a dray.

B. Man, æt. 39, left leg. Both bones broken nearly on a level, about three inches above ankle. Delayed union of tibia.

C. Man, æt. 34, right leg. Both bones here also nearly on a level, just below centre of limb.

D. Woman, æt. 50, left leg. Lesion, of tibia very oblique, that of fibula somewhat higher up.

E. Woman, æt. 50, right leg. Tibia transverse immediately above ankle. The fibula about three inches above the joint.

These five and the next were all treated in the ordinary fracture box, with falling sides, of the hospital.

*Of One Bone only (Three Cases).*

A. Man, æt. 24. Left tibia, about centre. This man's other limb had been amputated below the knee for former injury.

B. Woman, æt. 50. Fracture of tip of right malleolus. Injury caused by a fall, when she also received a severe wound on the forehead.

C. Girl, æt. 23. Left fibula broken very high up. A sequestrum, comprising the greater part of the femur on the same side, had been some years previously removed from this girl.

Both these cases treated with straight internal splint.

*Sprain of Ankle (Three Cases).*

A. In a limb formerly the seat of severe injury. Man, æt. 32. Associated with much damage to fascial structures.

B and C. Both of right ankle, of moderate severity.

# Transactions of Societies.

## SURGICAL SOCIETY OF IRELAND.

SESSION 1878-79.

THE Second Meeting for the Session of 1878-79 was held at the Royal College of Surgeons, Friday evening, December 6th, Dr. MAPOTHER, Vice-President of the College, in the chair.

Mr. RICHARDSON read the minutes of the previous meeting, which were confirmed.

LIPOMA.

Mr. WHEELER submitted a specimen of lipoma, which he removed from the arm of a girl, aged fourteen, on the previous Tuesday. The following notes of the case were taken by Mr. Fraser, surgical pupil at the City of Dublin Hospital:—"The girl was admitted on the 26th Nov., 1878, and stated she was suffering from this tumour since she was twelve months old, and she is now fourteen years of age. It was found to be 15½ inches in short circumference, and 18¾ inches in long circumference, and it weighed 2½ lbs." The tumour (said Mr. Wheeler) extended from between 2½ and 3 inches of the acromion process to the internal condyle, and it was remarkable that, instead of being over, it was under the brachial aponeurosis. The brachial artery was situated behind it, as also was the median nerve. The internal cutaneous nerve could be seen; that nerve became greatly flattened, and was taken away with the tumour. This was an interesting specimen of lipoma, and it would be an interesting fact to ascertain whether there would be loss of sensation in the interna part of the arm.

ARTIFICIAL ANUS AFTER STRANGULATED CONGENITAL HERNIA.

Mr. HENRY GRAY CROLY presented a specimen which he thought of unusual interest. It was taken from a boy operated on by him for strangulated congenital hernia. The boy, seven years old, was admitted under his care on the 7th June last, suffering from strangulated congenital hernia of the right side. He was in a state of collapse, and was brought in from Dundrum, where he had been a patient of Dr. Ussher. The hernia was strangulated some days before he got medical advice, and hence on his admission to hospital the abdomen was enormously distended. If an operation was advisable there was no time to be lost. I operated (said Mr. Croly) in the usual way, and on coming down on the sac I opened it, and found a very large piece of adherent gangrenous omentum, on removing which I came upon a series of coils of gangrenous gut. I divided the stricture outside the sac first, but was unable to give relief fairly till I got inside the neck of the sac, where I divided it. The boy was then put to bed, and I confess I did not think he would have lived for an hour—an opinion that was shared in by Mr. Tufnell and all present. However, he rallied, and I covered the abdomen with a linseed meal poultice. I took a piece of the intestine, and, passing the catheter up through it, formed an artificial anus. The parts were excoriated from the discharge, but the boy improved in health, and the symptoms disappeared. Occasional injections were given, and the bowels acted on by the artificial anus. The boy was discharged on the 14th August. I saw him once at his own house, apparently in good health. The abdomen was flat, and the discharge came through this opening (indicating), and occasionally through the bowels, but the opening had lessened till it admitted size No. 12 catheter. Yesterday the boy was brought into hospital in a state of collapse, and died soon after his admission. Mr. Mackenzie made a very careful post-mortem examination. This (indicating) is portion of the scrotum, The catheter was passed through the artificial anus and through the portion of the intestine adhering to the surrounding structure. This (demonstrating) very much distended portion of the intestine was the small intestine above the anus. If you compare the portion of intestine immediately below with that above, the difference is very remarkable, the one not being larger than the little finger, and the other being enormously distended. Before the escape took place it was as large as my arm. The cause of death I really cannot account for, because I did not see the parents to tell me what state the boy was in for some days before his death. He was going on well until the symptoms of collapse set in. The discharge through the artificial anus continued, and there was also a discharge of fæces through the rectum, so that there was no obstruction to the discharge from the intestine to account for the symptoms. This portion the catheter is passed through, is almost the entire of the rectum, and when you compare that with the ilium above it the difference is remarkable. I think this case is interesting in a great many points of view. Strangulated congenital hernia in a child of that age is rare. I operated once on a child eighteen months old, and this boy was seven years old. These are very rare cases, especially the second, where, notwithstanding the condition he was in, the boy got on so well from the 7th June to the 14th August. I have ascertained from Dr. Barker that he has not a similar specimen in the museum, *i.e.*, a specimen of artificial anus and strangulated congenital hernia, with an enormous amount of gut. What the cause of death was I am not in a position to say. The intestine was a good deal congested, but that might have been probably an old condition.

Mr. WILLIAM WHEELER read a paper descriptive of a case of

OSSEOUS UNION IN FRACTURE OF THE PATELLA,

which will be found on page 20.

PRESIDENT—Mr. Wheeler has brought forward the important questions—first, whether bony union occurs in transverse fracture of the patella; and secondly, as to the mode of fixing the limb and fragments, so as to procure this union.

Mr. TUFNELL said that having treated a case with Mr. Wheeler's splint, he could report favourably of it. He laid the limb in the splint till effusion had subsided, and then used compression and counter-compression; and the man on whom he so operated was now in the full exercise of the

power of his limb; but whether there was bony union or not, could only be decided after his death. Prior to Mr. Wheeler's case, he was under the impression that there was no such thing as bony union known; but viewing the section submitted by him, there was undoubted bony union, as anyone who had examined the specimen would say. As to the advantages of Mr. Wheeler's splint over every other previously adopted he did not pronounce; but there was no objection to Mr. Wheeler's that he could advance. There was, however, just the possibility of not having an instrument of the kind at hand. In that case advantage was derived from using the ordinary sticking plaster, raising the lower extremity, and advancing the body to meet it, thereby bringing about a ligamentous union, which was sufficient for all the purposes of life, enabling an individual, as it did, to go about his business after a reasonable length of time. The great thing was to allow effusion to subside and then to give, before the individual returned to his habits of life, a sufficient length of time for the ligamentous or bony union, whichever it might be, to consolidate. No better result could have been attained by the use of any form of splint than what he witnessed from the use of Mr. Wheeler's; and until then he did not believe in bony union. After microscopic or any other examination, nobody could deny that bony union existed in the present instance.

Dr. JOHN BARKER said he had not examined Mr. Wheeler's specimen. In the museum there were only two specimens of bony union, and in these the fractures were not, in his opinion, complete. A third was sent to him as a specimen of complete bony union; but it was macerated for a lengh of time, and the supposed bony union had disappeared. Another specimen (which he produced) was sent as one of bony union; but he did not think there was any fracture at all, and in that opinion he was borne out by almost all who had examined it. There were few museums that contained specimens of bony union; so that its existence was a rare thing indeed. He believed there were some in Edinburgh, and one in the great German Museum in St. Tesson. It was difficult to decide whether Mr. Wheeler's specimen was one of bony union, being in a dried state, and therefore he suggested that it should be macerated in order to clear up the point. In pathology, it might be of great advantage to know whether or not bony union had occurred, though to the individual it might be of none. Mr. Wheeler had mentioned the use of Malgaigne's hooks. In Edinburgh there was lately a tendency to use hooks of a different kind by embedding them in plaster bandages one above and another below the patella, and using them exactly the same as Malgaigne's books. From this treatment, it appeared, Mr. Spence had produced good results.

Mr. W. STOKES having seen the patient in the Whitworth Hospital, from whom the specimen exhibited was taken, said had he not been told that fracture of the patella had occurred, he would not have guessed even the existence of the injury, so close and perfect did the union appear to be. It would, however, be important that Mr. Wheeler should state in his reply what was the length of time during which the bone had been subjected to maceration; for he thought there was a good deal in what Dr. Barker had said as to determining whether true bony union had taken place. Assuming that it had taken place, and judging from external appearances it had, still too much importance should not be attached to the fact of getting bony union. In saying this, he did not wish to speak in the slightest degree disparagingly of Mr. Wheeler's apparatus, but merely as to the real importance of getting true union in this fracture. Anyone who had experience of such fractures, would bear him out in saying that where they obtained fairly close fibrous union, the patient enjoyed as much use or as good use of the limb as he had done previous to the accident. In most cases the patient would be able to perform the same feat as Mr. Wheeler's patient; namely, of getting upon and down off a milk cart 440 times a week. Last summer he had an opportunity of witnessing in London a case exhibited to him by a very eminent surgeon there, that of a young gentleman who had sustained fracture of the patella, with at least half an inch between the fragments, and yet he continued to be one of the most distinguished cricketers in the University of Cambridge, and he was also equally noted at lawn tennis and football. M. Deprêt, who has published some cases lately, mentioned instances where the patient had sustained fractures on two different occasions in the same bone; and he very pertinently asked the question, "Why was it that the fibrous union did not give way when the second injury occurred instead of the bone; and would not this go rather to show that the fibrous union that took place was stronger than the bone itself?" He did not say he endorsed these views, but he mentioned them as showing they should not attach too much importance, however interesting the fact might be, to the obtaining of osseous union in those injuries. At the same time he hoped anything he had said would not be taken as in the slightest degree disparaging to the ingenuity Mr. Wheeler had displayed in the excellent appliance which he hoped to test practically at no distant time. Mr. Wheeler had mentioned that his plan was superior to the method known as Malgaigne's, and in that he entirely concurred. It was also preferable, he might have said, to a plan recently proposed and put into practice, but which, he hoped, no surgeon in Dublin would ever adopt; namely, cutting down and opening the joint, and using all antiseptic precautions, laying it open so as to stitch the fragments of bone together by wire or catgut sutures. That was a plan which had been carried out with success; but it was most unjustifiable when they had so excellent an appliance as Mr. Wheeler's to use.

Mr. ROBERT MCDONNELL thought it would be necessary to make a further examination of the specimen before concluding that it was an instance of fracture with bony union, and for that purpose different sections of it should be made. On examining the smaller of the two fragments with a lens, there was not the slightest sign of fracture visible in the denser structure. He had examined a very large number of sections of fractures—those made by Mr. Smith of Colles' fracture; and lately a beautiful collection of the ribs made by Prof. Bennett. In all these, even long after the fracture occurred, there were some signs to be seen along the denser tissue upon each side of the cancellous structure; but in the specimen under discussion, there was not the faintest sign visible along that line. It was remarkable that along the cartilaginous surface there was a ridge; but, as they knew, there were anomalous conditions in bone which would closely simulate fracture and deceive the surgeon. He had himself experienced an instance of this in a case of injury of the spine, in which he had reason to think there was a fracture of the spinal process, and a nodule was felt very much like a displaced portion of bone. The patient died, and then it was found to be a remarkably large nodulated spinous process. From the specimen before the Society, he did not think they could conclude that it was an instance of bony union without a more thorough examination than had been made of it. Maceration, he thought, was wholly useless for the purpose. He would say either it was not a fracture at all, or it was a fracture with bony union.

Mr. RICHARDSON—Have you the other patella?

Mr. WHEELER—I have (produced).

Mr. THOMSON joined Mr. McDonnell in his scepticism as to the condition of the bone under observation. Looking at the posterior surface of it, there could be no doubt there was a distinct bony ridge running in what he presumed was pointed out as the line of fracture; but certainly upon the front of it there was no indication whatever that at any time the bones were separated. There was a depression on one side of the bone to which Mr. Wheeler had alluded, and he would suggest whether that depression existing in an abnormal bone was felt during lifetime, and regarded as a separation of the fragments of the bone. He also entirely concurred with what Prof. Stokes had said as to whether they might not be aiming at too high a mark in endeavouring to get bony union, and whether they did not succeed in getting quite sufficient comfort for the patient by procuring pretty close fibrous union. The splint exhibited by Mr. Wheeler was, he had no doubt, extremely good, and he should like to have an opportunity of seeing it used in bringing the fragments together; but the apparatus was one not always available in general and especially in country practice, so that a less troublesome method of treatment must necessarily be adopted. He had himself tried the American plan of tying up the limb, and also that of simply treating the fracture by position. In the latter the fragments had approximated as closely as by any other methods he had seen. He had recently under observation a case of double fracture of the patella in a man who fell from a great height; and he was now enjoying perfect use of his limbs—the result of fibrous union—and able to go up and down stairs with great freedom. The patella had been fractured during the Indian mutiny, and about three years ago there was a separation of from three-quarters of an inch to an inch between the fragments; but

still he had perfect use of both limbs, and was able to earn his bread as a day-labourer.

Dr. ARTHUR BENSON, referring to the method objected to by Prof. Stokes—that of cutting down upon the joint, and bringing the bones together, said he witnessed a case where after the ordinary methods had been tried, no union could be effected by any other than that which was used by Prof. Lister. In that case there was a quantity of gelatinous matter exuded between the fragments.

Mr. STOKES—The case I alluded to was not operated on by Prof. Lister, but by an American surgeon. It was a recent fracture. I saw it in one of the journals.

Dr. BENSON—A very satisfactory result occurred.

Mr. WHEELER then replied. In addition to the specimens of bony union referred to by Dr. Barker, he said, as far as he knew, there were only two others. One was Gulliver's. That was produced under the most favourable circumstances; the capsule not being broken. The other was in the Hunterian Museum, and its history he did not know. His own specimen was macerated some forty-eight hours by Professor Macalister. Prof. Macalister made a section of it, and examined it microscopically with the result stated in his letter. Mr. Hamilton and Dr. Bennett had said it was the most beautiful specimen of bony union they ever saw. Of course he did not think it was of the last importance to obtain bony union. Pott had said it was better to have ligamentous union. But Jonathan Hutchinson was of a different opinion; he held that if the results followed to the patient of loss of power in the quadriceps extensor muscle and general weakness of the limb, fibrous or ligamentous union could not be considered so good as bony. The fact of the man getting up on and down off the milk cart 240 times a week, was a crucial test of the firmness of bony union. There was a gentleman in Dublin suffering from fracture of both patellæ, who walked as if he had locomotor ataxy. So widely spread were the fragments, that Mr. Swan suggested the advisability of tenotomy of the quadriceps-extensor, in order to let the fragments fall towards one another; where fractures occurred in the same bone already broken, instead of the fibrous union giving way, and not the bony, the cause was self-evident. There were certain ligaments that came down to the tibia, and were described as the ligaments of Barkow; and of course where there was the greatest amount of resistance, and not where there might be a little stretching, dependent in great measure on the amount of flexion of the joint, the fracture occurred. Mr. McDonnell had been most complimentary to him in saying either there was no fracture at all, or it was a fracture with bony union. In this instance there was not the slightest sign of fracture; but Mr. Tufnell first saw the case, and put his two fingers in between the fragments, Mr. Butcher saw it when broken, and so did Mr. Colles. It exactly answered Malgaigne's desciption, that by getting the parts adjusted, so perfect would the union become that the fracture could not be seen. This was exactly what his splint had accomplished. There was noanalogy between this fracture and a fracture of rib; for the respiration alone would account for the lines of fracture being visible in the rib. In certain conditions of fracture, good union by position was attainable; but in Sanborn's method the difficulty was to keep patients from pulling off the plaster. Unless the limb was kept in position, it was manifest that close union by position was not attainable.

Mr. MCDONNELL—I am satisfied with the answer Dr. Wheeler has given, that the evidence is sufficient of the existence of fracture.

The Society then adjourned.

---

THE annual death-rate last week in the large towns from the seven principal zymotic diseases averaged 3·6 per 1,000, ranging from 0·5 and 0·8 in Brighton and Portsmouth, to 7·4 and 8·3 in Sunderland and Salford. Scarlet fever showed excessive fatality in Sunderland, Oldham, Salford, and Newcastle-upon-Tyne. Small-pox caused 13 more deaths in London, 19 in Dublin, but not one in any of the other large towns. There were 58 deaths in London last week by violence, either accidentally or negligently caused.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 8, 1879.

## THE SANITARY CONDITION OF DEWSBURY AND ITS DISTRICT.

### DR. THORNE'S REPORT.

THE very able and elaborate report to which we propose to draw attention, furnishes the strongest evidence of the great difficulties to be surmounted, and the great work to be done, before the condition of our towns and villages can be said to respond to the requirements of sanitary science. On account of strong representations on the subject, and in consequence of the prevalence of infectious diseases, Dr. Thorne was instructed by the Local Government Board to make an inquiry into the sanitary state of the Dewsbury Registration District. The long time which has elapsed between this investigation and the publication of the report, is in itself an illustration of the delays and difficulties inseparable from sanitary reform. But that this delay is in a great measure unavoidable, will be apparent to anyone who is aware of the difficult and laborious task imposed upon the Government Inspector, and of the exhaustive manner in which it has been accomplished.

Dewsbury is a manufacturing town in the West Riding of Yorkshire. Its population is about 28,000; while that of the whole district is not far short of 150,000, an increase of 92,883, having taken place since 1861. Together with this great increase of population, there has been a large development of trade within the last twenty years. Small villages have become important towns. Places that were formerly remote and comparatively unknown, are now busy centres of life and commercial prosperity. In this rapid increase of population and prosperity, however, lies one of the difficulties in the way of living in accor-

dance with the laws of health. Houses have been multiplying out of all proportion to the sanitary knowledge of those who built or of those who inhabit them. Hence, as Dr. Thorne has shown, large towns and boroughs, whose sanitary experience has been dearly bought, have failed to take advantage of that experience, when the opportunity of an effective sanitary administration presented itself. Not only have those sanitary defects, which in the older boroughs were most glaring and most injurious to health, been copied in almost every detail, but the defective conditions once having been allowed to arise, they have been all but continuously perpetuated up to the present date. Hence ill-constructed houses, back to back premises, bad ventilation, bad drainage, or not drainaged at all, offensive privies, flooded cellars, heaps of decomposing rubbish, streams polluted with sewage, poisoned wells, and so forth. Then this district is a manufacturing one, and therefore is not free from some of those nuisances from which few manufacturing towns are exempt. For instance, one stage of the woollen manufacture involves a practice which is as strange as it is objectionable. After weaving, the wool is soaked in a ley of soda, urine, pig's dung, and other detergents to remove the oil with which it is charged. The urine is collected from house to house, and, in many parts of the district, it is a regular practice to have in the yards behind the houses, old barrels, in which the stale and decomposing urine accumulates until it is removed by the manufacturers.

When we come to examine that part of the report which deals in detail with the sanitary state of this district, we find it difficult to condense within a reasonable compass all that Dr. Thorne has to say upon the subject. A large proportion of the streets and houses of Dewsbury are in a most neglected condition. The roadways have never been properly constructed or channelled, and some are all but impassable to foot passengers. In other parts the streets are needlessly offensive through the existence of midden-privies close to, or within a few feet of, the footpath. Many of the better classes of houses abut upon the pavement, while the only open spaces which break the line of houses are occupied by groups of these same midden-privies. Many of the streets consist solely of back-to-back houses, and in such cases the privies are often placed between the house and the foot-pavement. Nor is this state of things merely confined to the old part of the town, for it is noticeable in those new parts of Dewsbury where the houses have been somewhat elegantly laid out with gardens in front of them. Even in the residences of the wealthier portion of the population, the drainage arrangement is such as to facilitate the escape of sewer-gas into them. Some of the principal business houses in the Market Place are occasionally flooded with water polluted with sewage matter. The condition of the dwellings of the labouring classes is, however, the most deplorable. Not to mention those dilapitated hovels which are to be found in some parts of the town, a considerable number of the older houses are grouped round yards, which are generally unpaved, and often very filthy. In these yards liquid refuse may be seen lying about; the midden-privies are of a most offensive description, and urine tubs, accumulations of pig's dung, and at times, undrained piggeries are scattered about. In fact, the condition of the streets, yards, and houses in certain parts of Dewsbury, is so bad, that it must have had, says Dr. Thorne, a large share in producing the habits of dirt and negligence, which are so remarkable among some of the inhabitants. Coming to sewerage and drainage, we find that both are defective in the extreme. The Beck is described as a stream so laden with sewage and manufacturing refuse, as almost to defy description, and its contents are often dammed back in the sewers and the cellars in the low-lying parts of the town. As the reader may have already inferred, the midden-privy is one of the worst nuisances in this place, being the most common means adopted for the disposal of the excrement and refuse of the population. In one town, the population of which is 27,000, Dr. Thorne found several of these privies built in actual contact with houses and soaking into cellars, while one was found in a new house built in contact with the bedroom of a neighbouring house at a lower level. The report that is given of many other urban districts is equally unsatisfactory, and much of our space would be taken up were we to describe in detail all the objectionable things which Dr. Thorne saw during his tour of inspection. That such a deplorable and wide-spread neglect of sanitation was found very injurious to the health of the inhabitants may be easily conceived. Deaths from diarrhœa and from fever, have in at least six out of seven years, reached epidemic proportions. This fever was almost invariably in that form which is associated with defective sanitary arrangements, viz., enteric fever, and the mortality which it has occasioned during the past seven years has more than doubled that of London, and was one-third greater that that which has prevailed in the large towns and cities of England. In Dewsbury itself, owing to the above causes, to the neglect of vaccination, and to the absence of means for the isolation of persons suffering from infectious diseases, both small-pox and scarlet fever have also prevailed in severely epidemic form. In the urban sanitary district of Liversedge, the death-rate has been 22·3 per 1,000, which is a high rate considering the widely scattered nature of the district. In this place, moreover, the constantly recurring prevalence of fatal diarrhœa, and the heavy death-rate in children are probably to be accounted for by the sewage and excrementitial nuisances to which so large a proportion of the population are exposed. Again, in Gomersal, which has no proper system of drainage, sewer gas found its way into many of the houses, and in 1873, was no doubt the cause of 200 people being attacked with enteric fever.

It must not be supposed that the sanitary condition of the Dewsbury district, bad as it is, forms a grand exception to that which obtains in other parts of this country. Unfortunately there are numerous districts in England the sanitation of which is little better than that which led to the inquiry of the Local Government Board, and of which Dr. Thorne has given so elaborate a report; nor should this fact be a matter of surprise to anyone who will consider the comparatively recent period within which preventive medicine has been a subject of special concern to either the profession, the public, or the legislature.

As we have already observed, hygiene is but a late development of modern medicine, while the many valu-

able principles and facts with which the professional expert may be conversant are at present unappreciated by a large section of the community, and cannot always be practically brought to bear upon habitations that were built by people who were totally ignorant of or indifferent to the insanitary state of their surroundings. Then there are those obstacles which personal prejudices, vested interests, and defective legislation throw in the way of sanitary improvements. An important part of Dr. Thorne's report consists of an elaborate series of "recommendations," which should, in respect of each place he visited, be taken in order to remove the nuisances above mentioned. But then, we would ask, what guarantee is there that those recommendations will be carried out. Not until more power is given to the local authorities, and more responsibility is attached to the owners of houses and other property, can we expect the alteration of old and the construction of new premises to be in accordance with teachings of preventive medicine. The great activity, however, which is everywhere discernible in matters of a sanitary nature, the renewed attention which the Government has promised to give to sanitation, and, above all, the interest that has been awakened in the minds of the public on the subject, are a sign that the time come when the chief causes of epidemic diseases will be removed from most of the towns and villages of this country. As long as the people themselves are supine with regard to any desired reform, we cannot expect that much will be done. But when once they have been aroused to a sense of the wrongs and prejudicial influences under which they have been labouring, both the state, and local authorities, and all responsible parties, will be called upon to rectify the evils complained of, and will be obliged to yield to the pressure of public opinion. It was in consequence of a memorial sent up to the Local Government Board by some of the inhabitants of Dewsbury that a Government inspector was sent to inquire into the sanitary condition of the district, and the more such inquiries are multiplied the more hopes we shall have of the principles of preventive medicine being practically carried out throughout the country.

## THE SUPERINTENDENCE OF DUBLIN SANITATION.

In a letter to the daily press Dr. Mapother, the outgoing (?) Superintendent Medical Officer of Health for Dublin, replies to the criticisms to which the corporation job has been subjected, and takes upon himself the entire onus of its paternity. His first point in favour of the abolition of his own office is that "in no other city did the offices (of superintendent medical officer and of medical officer of health) co-exist." This is quite true, but it needs an explanation, which, in our opinion, does not mend the reputation for jobbery which the corporation enjoys. When the Public Health Act passed four years ago two ranks of superior sanitary officers were created—(a) a superintendent medical officer of health, whose appointment by any sanitary authority was optional; and (b) a medical officer of health, who was, *ipso facto*, the dispensary medical officer of the district. The Local Government Board took upon itself, in serene contempt of the newly-made law, to change those designations, and it accordingly termed the superintendent "consulting sanitary officer," and the medical officer of health it called "medical sanitary officer." This would seem to have been done intentionally, in order to remove from the minds of the medical officers under the Act the idea that it was their business to superintend anything, or that they were to be custodians of the health of their district, and to impress them with the fact that they were only consultants and sanitary officers, *i.e.*, were only to open their mouths when ordered to do so, and were to confine themselves to noticing such nuisances as they happened to see. The Local Government Board thus initiated the policy of throwing cold water on the Act and on its active execution, which policy they have since pursued in all and every matter connected with sanitary administration in Ireland. But, it will be observed, they only changed names, and did not make any new office. But the corporation was not to be baulked in its little job. It determined to make *three* classes of medical officers—(*a*) the superintendent medical officer, to supervise and originate sanitation; (*b*) the medical officer of health (an officer in all other districts identical with the medical sanitary officer), without any duty that we can understand except "helping Jack"; (*c*) the medical sanitary officer, or dispensary medical officer (properly called the medical officer of health), to report nuisances and recommend remedies. Thus, availing themselves, at the same moment, of the words of the Act and of the contrary words of the Local Government Board, the Public Health Committee of the corporation found themselves in the enjoyment of a desirable opportunity to create an extra office, and oblige a friend with an additional salary. To resist so tempting a chance would have broken in upon the traditions of the corporation, and could not be thought of, and accordingly the redundant office and redundant salary was with relish created.

Thus it comes, as Dr. Mapother says, that there is an extra supervising officer in Dublin not to be found elsewhere, and we can only regret that his strong and praiseworthy feeling that such an officer is an unneeded expense to the citizens did not find forcible expression at the time when the appointment was made, but that his remonstrance against the maintenance of such an officer should have been held over for nearly five years, until the propriety of abolishing the higher office became evident upon his mind.

Dr. Mapother goes on to say,

"Under the new Act the fifteen dispensary physicians become medical officers of health for their respective districts, and with, I hope and believe, increased salaries."

We hope so, too, but we repeat what we have already pointed out, that the dispensary doctors do not now "become" anything. They always were medical officers of health under the Act, though the Local Government Board chose to change their name, and always were charged with exactly the same functions as at present.

It is, therefore, quite erroneous to suggest that the superintendent officer may be abolished because additional subordinate officers have been provided by the new Act. The new Act, in truth, makes no change whatever in this

respect, and if there ever was a *raison d'être* for two superior health officers, that *raison* still exists.

Dr. Mapother says "the machinery for isolation—of infectious patients—removal to hospital, and disinfection, can be devised and supervised by the superintendent medical officer. He also deals with vital statistics, chemical and trade nuisances, water supply, sewerage, &c." Here is abundant work for the whole time of the most energetic officer, and it is difficult to understand how it is to be performed in the leisure hours of a lecturing and teaching professor, who has to do the analyses of pretty nearly the whole of Ireland, and whose pen is as busy in literary work as his brain and fingers in his laboratory duties. But there is one more duty—more important in the filth-afflicted city of Dublin than all the others put together—that is, eradicating the fever-haunted tenements of the poor; ferretting out these pest houses, the enforcing cleanliness and proper sanitation in them, and watching the sanitary officers to make them active in their duty. The citizens of Dublin can afford to wait for the more ambitious schemes of sanitation if they can only achieve simple cleanliness; and a medical officer of health would have done little towards abatement of the death-rate who had not devoted himself with all his energy to obtain that elementary requirement, and this no mere bureaucrat could do.

We do not grudge the superintendent medical officer his retirement, nor his successor the additional salary. A few hundred pounds a year are not worth considering when a hundred avoidable deaths in one week are before us, and the citizens would have no cause to complain if the corporation voted £1,000 a year to a really capable active chief officer. But the services of an officer who could only make a show of doing the duty would be an expensive luxury, if given gratis, and the citizens should resist by all means every proposition to commit the sanitary guardianship of the city to any person, however eminent, who is so situated as to be incapable of fulfilling the trust. Other cities might suffer such a job, but Dublin must not, for it is—amongst cities—the one which needs activity in sanitation, and to remit it and its public health to the unstimulated routine of the corporation would be to confirm all the disgraces and miseries which have made a by-word of its sanitary administration.

# Notes on Current Topics.

## Harveian Society's Conversazione.

THE annual meeting of this Society was held in the Stafford Rooms on the evening of Thursday, Jan. 2nd. The treasurer's report showed that the finances of this growing Society were most satisfactory. Eight new members were elected during the year. Only one member was missing from the last year's list—the late T. Carr Jackson, who had to retire from the post of President in consequence of disease which soon proved fatal. The rooms were handsomely decorated by paintings and etchings lent by Dr. Farquharson, Mr. George Field, Mr. Henry Sewill, Mr. Edmund Owen, Mr. Ernest Hart, and many others, while, with his wonted courtesy, Mr. Seymour Haden sent a number of his own exquisite etchings. Messrs. Kröhne and Seseman exhibited a number of surgical and other instruments, while Messrs. Collins showed a number of microscopes of different forms, with some very beautiful microscopic subjects lent by members; one, a section of the ovary of a cat, lent by Dr. Wiltshire, was an exquisite preparation, in every way. The retiring President Dr. Graily Hewitt, delivered an address in which, after referring to the affairs of the Society, he chiefly discussed chronic partial starvation, as seen in the subjects of uterine disease with consequent anorexia and nausea. He insisted strongly that a long process of such chronic starvation required a long course of systematic treatment and suitable diet before the normal condition of the organism was regained. There was a large attendance in spite of the inclement weather.

The following is the list of office-bearers for the coming year, 1879-80:—

*President.*—Henry Chas. Stewart, Esq.

*Vice-Presidents.*—John Easton, M.D.; E. Symes Thompson, M.D.; George Eastes, M.B.; Robert Farquharson, M.D.

*Treasurer.*—Henry Power, Esq.

*Hon. Secretaries.*—J. Milner Fothergill, M.D.; George P. Field, Esq.

*Council.*—W. M. Graily Hewitt, M.D.; Stamford Felce, Esq.; F. J. Gant, Esq.; Walter Cheadle, M.D.; Granville Bantock, M.D.; N. H. Stevens, Esq.; Alfred Wiltshire, M.D.; T. Fitzpatrick, M.D.; H. Sewill, Esq.; H. T. Mapleson, Esq.; Edmund Owen, M.B.; T. Buzzard, M.D.

## The "American University of Philadelphia."

A COUPLE of Graduates of this University having presented themselves for Dental Registration by the General Council, it became the duty of the Registrar to write to the Institution for information. Having done so, he received a note to the effect that the claimants were "regular graduates" of the University.

The information was also given that "the examination in all cases is made by the Faculty," not a word being said as to the *locus* of the Faculty or the nature of the examination, and that "under these the students in dentistry are constantly placed," whatever that phrase may mean—

This letter was accompanied by a pamphlet of sixteen octavo pages, entitled "The 28th Annual Announcement of the American University of Philadelphia, and Eclectic Medical College of Pennsylvania, 1878-1879," wherein it is set forth that the University possesses a "Faculty" of sixteen Professors, who are said to give six lectures daily on a great variety of subjects, comprising "Nervous Diseases," "Electricity and Jurisprudence" (united in one chair), "Gynæcology," "Operative Dentistry," &c.; that the graduates of the University "may be numbered by thousands, and that they form the great representative men of North America and Great Britain;" that their "students will have superior advantages over all other medical schools, as by our Pathology and Materia Medica the treatment of many incurable diseases is rendered easy and efficacious;" that their "lecture rooms are supplied with all modern conveniences;" and that their "Anatomical Museum is the largest in the United States, containing

25,000 specimens of normal and morbid diseases, delineating every disease incident to the human body."

With a tender solicitude lest students seeking to enjoy the great advantages thus held out to them should miss their way, or fall into the hands of the Philistines, they are urged by an especial notice to "have the address of the College (514 Pine Street) clear in their mind," and to "take advice from no one, for they must bear in mind the Allopathic Bullies are so desperate, and the Swindling-shops of Bogus Colleges are so numerous, that our students must not be imposed upon."

Of course, the graduates of this admirable institution will be capped as dental surgeons in the British roll of honoured practitioners. Their presence would pleasingly diversify the monotony of that catalogue of counter-prescribing druggists and their shop-boys, and it is to be assumed that Mr. Tomes and Sir John Lubbock in their consideration for "vested interests" have not forgotten those of the two holders of diplomas from this concern. How gratifying it will be for the surgeons who practise dentistry in Great Britain to be associated with so numerous and distinguished a body of practitioners!

## Sanitary Inspection in Ireland.

A PROSECUTION was instituted at Monastereven, in Ireland, against a constable of police, for having permitted a small-pox patient to walk the public road to hospital, and for having omitted to get the justices' order for his removal. The charge was not proved, but in the course of the evidence it came out that, in this populous district no sanitary authority had been appointed in accordance with the law—there was no conveyance for the sick—and it was nobody's business to look after the poor, although a serious epidemic of small-pox was present in the adjoining district. It is to be presumed that the Local Government Board for Ireland would have remedied this condition of things if they knew of it. That they did not know of it is the result of the omission to provide for sanitary supervision, in consequence of which the departmental authorities have no knowledge of the working of any district. For aught they know, half the districts in Ireland are in the same condition as Monastereven, and half the sanitary authorities and their officers fast asleep. Under these circumstances it is not surprising that the Public Health Act has turned out to be a sham in Ireland, and that sanitation has made hardly any progress since its passing.

## The Coming (?) Meeting of the General Medical Council.

THE Executive Committee of the General Medical Council is again summoned to meet on Wednesday, the 8th inst., to further consider (and, we hope, to complete) the long-promised report on the re-constitution of the General Medical Council, which is to form the basis of the debates in that conclave when it meets specially for consideration of that subject, if it ever does so. We cannot speak with certainty on the subject, for, although the Council is formally pledged to arrive at a conclusion on the matter before Parliament meets, we hear whispers of a disposition on the part of some of its members to "hasten slowly." Parliament is to open its doors on the 14th of February, so that there remain just six weeks for the committee to complete its report—the President to notice the Council, the members to get to London, and the discussion to be carried through, and yet we hear that some of the Executive Committee think there is time enough, and even that it might do well enough—in view of Lord George Hamilton's intention to wait for information—to postpone the subject to an early meeting of the Council, say, in May next. We caution all whom it may concern that such a move is quite possible, for the Council has already shuffled out of the question once, and there are those amongst its members who, being desperate in their apprehension of reform, would do all *per fas aut nefas* to upset the legislation which the profession so ardently hopes for. Fortunately, the Parliamentary Committee of the British Medical Association—the Irish Medical Association—Messrs. Mills and Childers—the foreign and colonial graduates—the Medical Defence Association—and the women doctors are all at work jogging the memory of Government, and it is not likely that the Medical Council will be allowed to rest happy in the hope of further procrastination.

## Women's Clothing.

APROPOS of the remarks we lately made about the inclemency of the weather, and the best means of protecting ourselves against it, we will quote some very judicious observations which Dr. Milner Fothergill has recently made in his London letter to the *Philadelphia Medical Times*. "Many poor people," he says, "cannot get proper underclothing, but many there are who can purchase proper materials, but who do not. Especially is this true of women, numbers of whom have only a cotton chemise under their corset, even in the coldest weather. It is scarcely possible to write dispassionately about female underclothing, or rather the want of it. I often study the shop windows where female underclothing is sold, and contrast them with gentlemen's hosiers, whose windows are crammed with merino vests and drawers, flannel shirts, and the female shop windows being hung with linen and cotton vestments only. Why in the name of common sense don't women wear a woollen outer skin in winter as well as men. Above the corset there is frequently nothing but a frilled chemise under the gown, and not one single scrap of flannel. The chest walls of women are not generally very thick over the subclavicular region, and the low external temperature, must affect the apices of the lungs and cause vascular disturbances in them, resulting often in disease. Moreover, no amount of external garments will compensate for the lack of sufficient underclothing." Dr. Fothergill also draws attention to the bodily fatigue and restraint arising from the weight of the thick jackets which are usually worn, and which are a check to the freedom of action and activity in walking so necessary to maintain the heat of the body, and to prevent the coughs and colds to which people are so commonly exposed during the winter months. We quite agree with all that Dr. Fothergill has said on this subject, but with regard to the greater exposure of women's chests it is questionable whether the apices of the lungs are more frequently affected in them than in men.

## Neglect of Vaccination in Ireland.

At a recent meeting of the Mallow Guardians, their attention was called by the Irish Local Government Board to the startling absence of vaccination protection amongst the children within the union. The children in the workhouse school are of course collected from all parts of the union, and if the state of vaccination amongst these children, as described by Dr. MacCabe (the Local Goverment Board Inspector) is to be accepted as an indication of the general state of vaccination throughout the union, it would appear to be extremely unsatisfactory. On the day of Dr. MacCabe's inspection he examined the arms of all the children in the schools with the view of ascertaining to what extent they were protected against the danger of contracting small-pox. 68 children were examined with the following results :—presenting 3 vaccine cicatrices, 1 ; presenting 2 vaccine cicatrices—typical, 10 ; fair, 10 ; bad, 1 ; presenting 1 vaccine cicatrix—typical, 6 ; fair, 17 ; bad, 7; presenting no trace of vaccination, 16 ; proportion per cent. unprotected on day of inspection, 33·6. And Dr. MacCabe observes that the proportion is really larger, because the seven children presenting one bad mark must be considered to a great extent as unprotected.

## Accidental Tartar Emetic Poisoning.

Last week the coroner for the county of Monaghan held an inquest respecting the death of a widow, aged sixty-nine years. It appeared in evidence that the deceased had, for some years been subject to severe attacks of dyspepsia, and for which she usually took a small quantity of carbonate of soda mixed in buttermilk. On the day of her death she was visited with one of those attacks, and on its coming she took a quantity of a white powder which she believed to be soda, and from the effects of which she died. Dr. Thompson was called in, who pronounced the powder to be tartar emetic.

## Borax as a Meat Preservative.

It is known that borax has been advantageously applied in the preservation of meat. Some experiments have lately been made by M. De Cyon as to the physiological action of that substance. He fed dogs, in one series of experiments, on meat preserved by M. Jourde's process, and in another on fresh food to which various quantities of borax were added. It was found that borax added to meat to the extent of twelve grammes daily (which is ten times what the Jourde's process requires), may be taken in diet without causing the least disorder of general nutrition. Further, borax substituted for marine salt increases the power of assimilating meat, and may greatly increase the weight of an animal, even when the alimentation is exclusively albuminoid. These observations, we are reminded, apply only to *pure* borax, *i.e.*, containing neither salts of alum and lead, nor carbonnte of soda, which are often met with in the borax of commerce.

The *British Medical Journal* says that further pressure is being put on the Government to carry out the amendment of the Medical Acts in reference to the status of Indian and Canadian degree ; and the urgency of this question will, we believe, be found to have an important influence this session in accelerating medical legislation.

## The Health of Dublin.

The death-rate had, in the week ending December 28th, decreased from 41·0 to 38·5 per 1,000 of the population. The deaths were ·61 above the average, and the ratio nearly 10 per 1,000 above that of London (27·7) the only city from which returns had been received. The deaths from respiratory diseases for the five preceding weeks were respectively 57, 73, 89, 87, 87, and the number for the week ending December 28, had risen to 96. The zymotic mortality is 5 under the previous week, but still 11 over average, 19 small-pox cases being included. There was happily a marked reduction in the number of new cases admitted to hospital.

## An Irish Centenarian.

A veritable centenarian expired at his cottage, near Clonmel, last week, named James Doheney, who had enlisted in the 60th Rifles previous to the famous year of '98. He served through the first Peninsular War under the Duke of Wellington, and under General Johnson in Ireland, at the time of the rebellion in the year '92. He retained the use of his faculties up to the last moment.

## The Passing and Coming Generation of our Profession.

The obituary list which will appear in the forthcoming issue of the "Irish Medical Directory" will contain sixty-three names of members of the profession deceased since the last publication. The new edition of the "Directory" will contain more than two hundred new names of gentlemen as having settled to practice or been registered in Ireland during the year.

## Rabies in Cows.

A Geneva journal named *La Salute*, conducted by Dr. E. Maraglione, recently published some interesting particulars of a well-authenticated outbreak of rabies among cows which occurred on a farm at St. Colombie, in the Canton Haglinvan. In the beginning of October several cows belonging to a M. Duboy were bitten by a dog belonging to the herdsman. The dog was at once tied up, and from that moment it declined to eat, and died after some days of suffering, exhibiting, among other symptoms, complete paralysis of the posterior half of the body. On November 2nd, three of the cows that had been bitten refused their usual food ; a viscid saliva flowed from their lips ; their bellowing could be heard at a distance of 3 kilometres. Shortly afterwards some paralysis of the hind limbs was noticed, and on the sixth day they succumbed, paralysis of the entire posterior half of the body being then complete. During the whole progress of the disease the animals showed no disposition to bite, nor were in any way savage ; but the accidental presence of a dog excited them in an extraordinary manner. By the end of three months eleven of the herd had fallen victims to the disease, the period of incubation having ranged from twenty-five or thirty days in the first case to fifty-six or more in the three last animals attacked.

THE milder weather of the past week appears to have caused a slight diminution in the extraordinary death-rate of the previous week. It is, however, unusually high still, the Registrar-General reporting the following rates in the principal cities and large towns of the United Kingdom, ranging in order from the lowest, were as follows:—Portsmouth, 17; Edinburgh, 24; Brighton, 24; Plymouth, 24; Nottingham, 25; Sheffield, 27; Sunderland, 27; London, 28; Leicester, 29; Wolverhampton, 30; Bradford, 30; Hull, 31; Oldham, 31; Birmingham, 33; Leeds, 34; Newcastle-upon-Tyne, 35; Glasgow, 36; Bristol, 37; Liverpool, 37; Dublin, 39; Norwich, 41; Manchester, 42; and the highest rate 44 in Salford.

---

In the principal foreign cities, the annual rates of mortality, according to the most recent weekly official returns were, in Calcutta, 49; Bombay, 34; Madras, 42; Paris, 25; Geneva, 24; Brussels, 28; Amsterdam, 25, Rotterdam, 29; The Hague, 31; Copenhagen, 25; St. Petersburgh, 41; Berlin, 25; Hamburg, 24; Dresden, 21; Breslau, 27; Munich, 34; Vienna, 28; Buda-Pesth, 38; Rome, 29; Naples, 26; Turin, 33; Alexandria, 47; New York 25; and Philadelphia, 18.

---

A VILLAGER in America has just taken an action against the local authorities of Rutland for forty thousand dollars damages, for the loss of three children from diseases caused by imperfect sewerage. A suit or two of this kind might do no harm in this country.

---

THE Mutter lectures on Surgical Pathology, before the College of Physicians of Philadelphia, are delivered this year by Dr. S. W. Gross. The subject is the "Surgical Pathology of Tumours."

---

M. PAUL BROCA, the famous anthropologist, is authority for the statement that the tallest man ever actually measured was a Finlander, nine feet three and seven-tenths inches high, and that the shortest man known reached a decimal under seventeen inches in his stocking feet.

---

LAW-SUITS for malpractice are said to have lately become so common in New York as to constitute quite an epidemic.

---

**Royal College of Surgeons in Ireland.**—At the December examinations at this College, the following candidates obtained the licence in surgery:—

William Theodore Atkinson, James Robert Barton, Henry Lewis Battersby, John Cashin, Patrick Francis Coglan, Daniel Corbett, Peter A. D'Alton, James Joseph Davis, Michael Donnelly, John Alexander Dockeray, Albert J. Duffey, Thomas Fitzpatrick, Samuel Flood, Armitage Forbes, Simon K. Furney, James Joseph Harding, Richard C. Laffan, Edward L. Ledwich, Henry Lentaigne, Henry Love, John William Macnamara, Michael Joseph M'Coy, William Joseph Magee, Alfred Mason, John Mason, James M'Loughlin, George Mark P. Murray, Charles G. O'Connor, Walter Stephen Palmer, Charles Parke, Thomas Heazle Parke, William Johnson Patton, Henry Pentland, Bernard Reddy, Denis Daniel Redmond, Edward James George Rothe, Thomas Sheedy, Henry Wm. Smith, Edward George Stokes, Thomas Joseph Tobin, Charles Vokes, H. L. E. White.

# Literature.

## GANT'S SCIENCE AND PRACTICE OF SURGERY. (a)

THE second edition of Mr. Gant's surgery has appeared in two volumes. It has been thoroughly revised, and in many parts re-written, and enlarged to the extent of five hundred and thirty-two pages, with a full and valuable index. Practical anatomy of various important parts has been introduced in connection with injuries and diseases, and attention has throughout been paid to pathology. Not a little advantage has been gained by referring chapters in special diseases to those who devote their time to those subjects. Hitherto this has only been attempted in encyclopædias, but these are too bulky and expensive for the majority of general practitioners and students; and now that Mr. Gant has adopted the plan in his comparatively small and inexpensive work, we shall be much surprised if it does not go far to make it one of the most popular surgical text-books in the English language. Mr. Hy. Power, of St. Bartholomew's Hospital, has revised and considerably enlarged the chapter on Diseases of the Eye, Dr. Purves has written a chapter on the Ear, Mr. Charles Tomes, F.R.S., one on Dental Surgery, Dr. Morell Mackenzie, on the Throat, Mr. William Adams on Deformities, Prof. Erasmus Wilson, F.R.S., on the Skin, and Dr. Robert Barnes on Diseases of the Female Genital Organs. In addition, Dr. Mahomed has communicated a special description of the Sphygmograph and its applications in various clinical investigations, the simplest and most explanatory account of the instrument and its uses with which we are acquainted.

These valuable revisions and additions by authors, so well known, are a guarantee at once of much useful information and of the value of the work. In the preface we are informed that 849 new wood engravings have been introduced, the pathological series having been selected from the rich collections in the Royal College of Surgeons, and most of the metropolitan hospitals.

The first chapter enters upon the subject of Inflammation, and is in itself one of the most exhaustive and best written treatises to be found in any existing text-book. The views of Professor Burdon Sanderson here predominate, whilst those of Billroth, Virchow, Simon, Cohnheim, and other writers, help to make it complete.

In the subject of Tumours the description of each variety is good, and the diagrams are both numerous and excellent, and materially assist the student both to recognise the appearance and to remember the structure of each growth. We do not, however, agree altogether with the classification. The classification of tumours ought certainly to be upon an anatomical basis, as being the most simple to comprehend, and as the truest reasoning upon their development.

Treating of the subject of Syphilis, Mr. Gant points out under the head of "chancroid," that form of chancre which is least likely to be followed by the secondary disease. It commences usually as a pustule, which, bursting, leaves a circular ulcer as if punched out, and having a cellular or honey-combed, worm-eaten appearance, covered with a greyish yellow membranous secretion; the margin of the ulcer is a little undermined, instead of sloping, as in hard chancre. The ulcer heals by granulation, and being attended with loss of structure, leaves a depressed and permanent scar.

The chapter on Aneurism is much improved, and rendered more interesting by the addition of diagrams of sphygmographic tracings. Doubtless, the introduction of these diagrams, and the excellent description of the instrument and its uses, will be the means of bringing the subject more under the notice of surgeons, and of introducing the employment of the instrument in surgical diagnosis. To the student, and the practitioner generally, the full description and illustrations of the surgical anatomy in connection with ligatures of the arteries, given in this work, will prove most valuable.

The chapters on Fractures and Dislocations are profusely illustrated by diagrams of preparations selected from the different hospital museums, explaining the positions of the fragments or of the extremities of the bones, and of the muscles by which the abnormal positions are brought about.

The last chapter of the first volume is on Deformities, and has been supervised by Mr. Adams, from whose pen we should

(a) "Science and Practice of Surgery." By Frederick James Gant. London: Baillière, Tindall, & Cox.

expect nothing but what is well worth reading. The explanation of this subject is quite up to expectation; it is short, concise, and well written, and the diagrams, which are numerous, can hardly be surpassed.

*(To be continued.)*

## Literary Notes and Gossip.

With the commencement of the year 1879, the Medical Press has entered upon the forty-first year of its existence. In these days of short-lived journalism this sounds almost ancient, and we believe that with the single exception of our contemporary, the *Lancet*, we can boast of being the oldest medical journal now published in the English language. We have much to thank our readers for in the past, and by their continued support, and the steady influx of fresh subscribers with each volume, we trust that we shall not be considered arrogating to ourselves too much by saying that the Medical Press has fulfilled a useful purpose.

* * *

Some few weeks ago we mentioned the fact that another medical journal was in the market, open to the highest bidder. We presume this advertised-for individual did not present himself, as the said monthly medical journal, like a good many of its predecessors, is now "numbered with the dead." But three months ago, and the *Medical Examiner* perished; now *The Doctor* is out in the cold. Truly 1878 has been fatal in more ways than one.

* * *

With the decease of *The Doctor* a very useful compendium of foreign medical literature has passed away. Started upon the embers of *The Medical Mirror* it, in like manner, has ceased to exist for lack of adequate support. There now remain in the field but the four old-established weeklies: The *Lancet*, Medical Press, *British Medical Journal*, and *Medical Times*, with a few monthly journals, and one or two quarterlies on special subjects.

* * *

In speaking of medical journals, we should perhaps be remiss did we not mention the *Students' Journal*. True, it does not profess to be classed in that category, but soars altogether into another atmosphere from the older journals; treating its readers to occasional ebullitions of "Young England," it indulges in lively interchanges of opinion, tries to squeeze a peck into a pint measure, and gives the gossip of every hospital and college in the United Kingdom through the medium of its local secretaries. On the whole, we have formed high opinions of this little fortnightly, and are glad to hear that students support it as "their representative," and that members of the various hospitals staffs recommend it for its elevated tone and general usefulness.

* * *

When, several years since, we introduced the improvement of cutting the edges of this journal, busy practitioners and advertisers, recognising its great advantage, clamoured for the cutting of the other medical jouanals which they patronised. But editors and publishers, like other men, object to "play second fiddle," and so the excuse was constantly advanced that their circulation was so large that it was impossible to cut the edges with sufficient rapidity to save post. "Public opinion" has, however, proved too strong for them, and the fallacy of the objection was strikingly shown last week by the issue of the *British Medical Journal* and the *Medical Times* with their edges trimmed, as ours. How small the circulation of these journals must have suddenly become!

* * *

Alcohol still continues to be the topic of the day in the medical and lay press. We have before us two quarterlies devoted to this subject, *The Quarterly Journal of Inebriety* (Baillière, Tindall, and Cox), and *The Medical Temperance Journal* (Tweedie and Co.). That sufficient interest should be awakened to support two such journals, beside the many weeklies of a less pretentious nature, is in itself a noticeable feature. The new number of *The Journal of Inebriety* is full of interesting reading upon the various phases and treatment of that weakness which is specified in its title. *The Medical Temperance Journal*, on the other hand, is composed almost entirely of reprints from papers in *The Contemporary* and other journals.

We understand that 240 new medical works and new editions have been issued during the past year. At first sight this would appear to indicate a considerable amount of energy on the part of authors and editors; but in reality it is a lower figure than usual, and when we take into account that innumerable pamphlets, introductory addresses, &c., which appear in book form are included, we are forced to admit, that medical literature of 1878 has shared in the general depression.

* * *

A want has been felt and expressed of a general index of medical works and papers; but no English publisher had sufficient enterprise or cared to embark his capital in the venture. So it has fallen to the lot of America, to supply the need, and with the new year will be issued monthly an *Index Medicus* of the current medical literature of the world. This new publication will record the titles of all new works in medicine, surgery, and the collateral branches, received during the preceding month. These will be classed under subject headings, and will be followed by the titles of original articles upon the same subject, found during the like period, in medical journals and transactions of medical societies. The periodicals thus indexed will comprise all current medical journals and transactions of value, so far as they can be obtained. At the close of each yearly volume a double index of authors and subjects will be added, forming a complete bibliography of medicine for the preceding year. Personally we shall find such an index of inestimable value, and we tender in advance our best thanks to Drs. Billing and Fletcher, the editors, and Mr. Leypoldt, the enterprising publisher, for opening up so valuable a literary mine.

## Correspondence.

### THE VACCINATION SYSTEM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Mr. Tuckey's paper on the above subject, though carefully prepared, has to my mind several faults. I have had as large, or perhaps a larger, experience in public vaccinating in Ireland than the author, and I can say that I did not meet with the "unwillingness" to bring children for inspection, and allow the lymph to be taken. I am aware that great unwillingness exists, but as a general rule it is caused by the manner in which the operation is performed. If public vaccinators used the same precautions and tenderness in dealing with the children of the poor as they would with their own children, and let the mothers see that in performing a public duty they do so with as little pain and uneasiness to the child as possible, things would be different. I have seen arms after public vaccination which were quite enough to account for "unwillingness." Surely the Local Government Board are culpable in this. They require no guarantee that their medical officers are *competent* vaccinators. Until some change is made in this direction, it is to be feared vaccination will show a default.

Mr. Tuckey is quite right in what he says about the age at time of vaccination. It is always better to have it over before teething begins.

As regards a public vaccine collector, such an appointment would be a direct slur on the proficiency of the Irish public vaccinators, and would be an unnecessary burden on the already over-taxed ratepayers.

I am, dear Sir,

Yours faithfully,

William Donovan.

Whitwick, Dec. 26, 1878.

### VACCINATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The continued prevalence of small-pox amongst us has become a subject of such great and painful interest that any suggestion for the prevention of that dire disease cannot fail to obtain attention, and I therefore hope you will consider the following observations, which I venture to make on the subject, worthy of insertion in your journal.

It has been stated that when small-pox broke out in Paris after the seige in the Franco-Prussian war, and spread, as it did, like a plague over France, Great Britain, and Ireland, that Belgium enjoyed a comparative immunity from the disease. It has also been stated that in Belgium medical men are constantly in the habit of vaccinating their patients with the vaccine taken fresh from the cow, as in the days of Jenner, while medical men in this country are restricted by law from using any vaccine but that obtained from the human subject.

Now there can be no doubt that vaccination of late years is not by any means as perfect a protection against contracting small-pox as it was, say, thirty years ago. At that time, I am old enough to remember that small-pox occurring after vaccination was very exceptional, and it was asserted by some that no *fatal* case of small-pox ever occurred after vaccination, and all know that such is not the case now. But while I still assert and believe that vaccination is the greatest and best protection we know of, I regret to say it is not so effectual as formerly.

Should, therefore, those alleged facts with regard to small-pox and vaccination in Belgium prove correct, which I myself cannot vouch for, it is surely a case for inquiry, and our sanitary authorities should be directed by Government to obtain the necessary statistics, which is the only way of ascertaining the truth; and if it should appear that it is from our mode of vaccination that the virus has lost, in any degree, its protective qualities by having passed through so many generations of human beings, I can see no objection to our following the example of Belgium, as stated, and take our vaccine again from the fountain head—that of the cow.

I am, &c.,

GABRIEL STOKES, M.D.

Mullingar.

# Obituary.

## DR. TYRRELL, OF DUBLIN.

WE regret to announce the death of Dr. Henry Tyrrell, of Dublin, which took place on Tuesday last at his residence, Merrion Square North, Dublin. Dr. Tyrrell received his first surgical qualification in 1855, and took the Fellowship of the Irish College of Surgeons in 1863. By his death, which arose, we understand, from gout in the stomach, following upon renal disease of long standing, a surgeoncy to the Mater Misericordiæ Hospital, and the Professorship of Surgery in the Catholic University become vacant. He was also the Surgeon to Maynooth Catholic College. He published in our pages two papers on the "Treatment of Traumatic Tetanus by the Use of Local Application of Tobacco," and others "On the Treatment of Fractured Patella," and "On Trephining the Spine."

## DR. STAFFORD.

ANOTHER name has been added to the long roll of Irish Poor-law medical officers, who in past years, whilst in the active discharge of their onerous and responsible official duties, have died at a comparatively early age, truthfully, it may be said, martyrs to duty, and victims of acute disease, contracted in the faithful pursuit of their unremitting and toilsome professional labours.

Sad and sorrowful it is at all times to witness the death, and experience the loss of relatives and friends, who in the maturity of years have "reached the sere and yellow leaf," when age and infirmity clearly indicate that the period of dissolution is at hand; but doubly sorrowful and sad it is when in the prime of life and vigour of manhood, when the soul is full of high and noble aspirations, and "decay's effacing fingers," have not yet left their mark on the human frame, the chill and pitiless hand of Death rudely snaps asunder in this life the golden links of friendship, love, and affection, which have bound us together in the bonds of peace and happiness.

Dr. Pierse Barron Stafford, of Soir Ville, Ardfinan, co. Tipperary, whose lamented death occurred on the 18th Dec., at his residence, was the third son of Pierse Stafford, Esq., of Kilmacthomas, co. Waterford, and decendant of a family which occupied a high and influential position for centuries gone by in the counties of Waterford and Wexford. Having completed his medical studies in the Queen's Colleges of Galway and Cork, he received his diploma of M.R.C.S.E. in 1855; and, subsequently, for two years held the position of Poor-law medical officer to the Tullagh Dispensary, Baltimore, co. Cork.

During the brief period of his connection with that locality, he succeeded, owing to his great zeal and medical skill, the kindness of his manner, and the amiability of his character, in gaining the love and esteem of the people, and the sincere friendship of numerous friends.

Amongst the grateful and kind-hearted peasantry along the sea coast of Caibery and its "Hundred Isles" the memory of his kind and useful services as a medical man is still treasured and preserved with fond recollection and affectionate regard and respect. Whilst stationed at Baltimore, Dr. Stafford married Harriet, third daughter of the late Dr. Donovan, of Spilbereen.

A vacancy having occurred in the Dispensary of Ardfinan, co. Tipperary, Dr. Stafford applied for the position, and was unanimously elected. In that populous and important district he officiated as dispensary physician for the last twenty years, and for fourteen years as medical officer of the adjoining district of Ballymacaibery.

The heavy and responsible duties of two districts—duties which he always performed with the most devoted zeal and untiring energy—broke down his constitution, and undermined his health; but the guiding star and ruling principle of his life were strong and predominant to the last. He was devoted heart and soul to his professional duties; and his love and regard for the suffering poor never wavered or declined.

Called away on a visiting ticket during the late inclement and severe weather, though in delicate health at the time, he faithfully responded to the call, and a severe attack of inflammation of the lungs was the result, which terminated in death, after a week's illness.

Rarely, indeed, has the death of any person through the wide county of Tipperary been so sincerely and thoroughly regretted. Dr. Stafford, by his kind-heartedness, pleasant genial manners, amiability of disposition, manly bearing, and gentlemanly demeanour, had gained for himself a host of true and sincere friends wherever he was known. Except when laid up by illness he never was absent from his post during his useful, honourable, career in life.

His loss will be deeply lamented by all his friends, but more especially by the poor, to whom he was always kind and devoted; and by them many a tear of sorrow will be shed, and many a fervent prayer will be offered up to the Throne of Mercy for the eternal repose and happiness of one who had always proved himself in the hour of need their generous friend and kind-hearted practical benefactor.

**Queen's University in Ireland.**—We understand that at a recent meeting of the Senate of the Queen's University it was decided that in future the University Examiners in Medicine, Surgery, Medical Jurisprudence, Materia Medica, and Midwifery should hold office for four years, instead of two years as formerly.

**Court Dress for the Medical Profession.**—The Queen has approved that the honorary physicians and honorary surgeons in the Royal Navy shall wear a gold and black sash of the same pattern as that worn by the honorary physicians and surgeons in the army. The sash is to be worn only with full dress when in attendance on the Sovereign or on State occasions.

# NOTICES TO CORRESPONDENTS.

## DEPARTMENT OF LUNACY.

IN accordance with the suggestion of several subscribers interested in, or attached to, asylums, we have decided to commence next week a "Department of Lunacy," under which heading space will be devoted to the discussion of those various subjects and questions in lunacy which are of such constantly recurring importance as to be practically beyond the pale of existing quarterly and half-yearly psychological journals. This Department, as with every other in this journal, will be open for the free expression of the opinions of all who are interested in public or private asylums; and as we are promised papers and clinical cases from several

valuable pens, it will become one of constant reference to all interested in the political, the social, or the clinical aspects of lunacy.

We beg herein to thank those many gentlemen who have promised us their support, both moral and pecuniary. Upon them depends whether the Department shall be weekly, fortnightly, or monthly, according to the supply of interesting matter with which we are favoured. That many "burning questions" will occupy the attention of the next Parliament is certain, it behoves all therefore, to be prepared.

HUNTERIAN SOCIETY.—This (Wednesday) evening, at 7½, Council Meeting.—8, Dr. Buzzard, "On Cases of Syphilitic Affection of the Nervous System."

SANITATION IN DUBLIN.—The *Irish Builder*, of Jan. 1 does us the honour to publish, at full length, our article of the 25th ult. on this subject, but says: "While admitting the sanitary condition of Dublin is very bad, and that the corporation are to blame for past neglect, we will be no party on any occasion to endorsing charges which are not thoroughly true in substance and in fact." We fail to understand the *Builder's* position. If our charges are not true, why republish them and thereby endorse them? If they be true, why insinuate that they are not? If partly true and partly false, why not point out the errors? The *Builder* ought to know something worth knowing about the dwellings of the poor in Dublin, and has often enough descanted on the absence of sanitary arrangements therein. We can surely form a judgment whether or not it is desirable to leave a city like Dublin to a merely nominal sanitary supervision as is now proposed. Why, then, does it not honestly express its opinion upon the subject and spare its readers the usual formula about its "right to independent opinion," which no one has ever challenged.

MR. A. LEATHER, Nunhead.—We believe there are between three and four thousand medical men in London and suburbs, and about ten thousand in the provinces. We are unable to give you any idea of the probable success of your proposed undertaking, not being conversant with commercial undertakings of this class.

DR. S. T. E.—The entire series will appear in due course.

AN INTERESTED ONE.—Your inquiries are answered in the notice which appears at the head of this column.

A GENERAL PRACTITIONER.—A meeting is announced for to-day (Wednesday).

DR W.—Many thanks. We have forwarded the letter on.

DR. H. M.—You are not at all behind, if all our subscribers were equally punctual there would be nothing to complain of. Our publisher will forward your account in due course.

DR. A. H. J.—It is so long since we do not remember the date. If you will favour us with the year the Index shall be searched.

DR. CARPENTER.—The reply to Mr. Upton, if inserted *in extenso*, would occupy three columns. We will reduce it to moderate limits and insert in our next, being much pressed for space.

THE Medical Society of the College of Physicians, Ireland, will meet on Wednesday next, at 8 o'clock, at the College Hall, Kildare Street, when the following communications are set down for reading:—Adjourned discussion on Dr. Hayden's paper on "The Treatment of Chorea."—Dr. Walter Smith, "On Illustrations of the Use of Chrysophanic Acid in Diseases of the Skin."

CLINICAL SOCIETY OF LONDON.—On Friday, Jan. 10, at 8 p.m., Annual Meeting—Election of Officers. The following cases will be brought forward: Dr. Cayley and Mr. Lawson, "Intestinal Obstruction, for which Gastro-Enterotomy was performed." Mr. Heath, "Case in which a Silver Catheter was broken in the Bladder." Dr. Southey, "A Case of Pleuritic Effusion treated by Capillary Drainage." Dr. Althaus, "Case of Disease of the Spinal Accessory Nerve."

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. John Harley, London. Dr. Andrew Clark, London. Dr. Phillips, London. Dr. Wheeler, Dublin. Dr. Whipham, London. Dr. Billings, New York. Dr. R. Fletcher, New York. Dr. Bodington, Kingswinford. Dr. Winslow, London. Dr. Timms, London. Mr. Douglas Hemming, Bournemouth. Prof. Charcot, Paris. Dr. Berkart, London. Dr. Johnston, Dublin. Dr. Tuckey, Castletownroche. Dr. Hugh Davis, Newport. Dr. Watson, Edinburgh. M. Preterre, Paris. Dr. Fryer, Sherburn, Yorks. Dr. Wood, Philadelphia. Dr. Walsh, Dublin. Dr. Williams, London. Dr. Wharton, Dublin. Dr. Brady, Rathgar. Dr. Robinson, Dublin. Dr. Ewing Whittle, Liverpool. Dr. Rutherford, Ballinasloe. Dr. Sterling, Thomastown. Dr. Sheill, Killyleigh. Mr. Frend, Manchester. Dr. Coates, Portumna. Dr. Stanley, Stokestown. Dr. Jackson, Ballyhaise. Mr. McNeary, Gurvagh. Dr. Hime, Sheffield. Dr. Woodhouse, Westport. Dr. Walsh, Enniskillen. Dr. Mackenzie, London. Dr. Harrison, Roscommon. Dr. O'Flaherty, Kingstown. Dr. Liveing, London. Dr. Jacob, Maryboro'. Dr. Ryan, Ballinebro'. Dr. Fisher, Mediterranean Squadron. Dr. Madras, Dripsey. Dr. Rooney, Athboy. Dr. Lyster, Kilkenny. Dr. Milton, London. Dr. Robinson, Beragh. Dr. Scott, Aughnacloy. Dr. Sproule, Moville. Mr. Pearce, Pimlico. Dr. Kidley, Tullamore. Dr. Moore, Rockcorry. Dr. Myles, Colehill. Dr. Bath, London. Dr. Harley, Dublin. Dr. Moore, Ardee. Dr. Brereton, Oughterard. Mr. Jabez Hogg, London. Dr. Dudfield, Kensington. Surgeon-General Gordon, Madras. Mr. Rathbone, M.P., Liverpool. Dr. Smith, London. Mr. Redman, Lincoln. Mr. Marston, Ludlow. Dr. Dolan, Halifax. Dr. de Fonmartin, Greenwich. Mr. Hyslop, Church Stretton. Dr. Craig, Bedford. Dr. Fixott, St. Heliers, Jersey. Dr. Harmer, Hawkhurst. Dr. Byas, Bow. Dr. Herbert Major, Wakefield, Dr. Milner Fothergill, London. Dr. Hicks, Hendon. Dr. Woakes, London. Dr. Carpenter, London. Mr. Leather, Bayswater, &c., &c.

## VACANCIES.

Bristol General Infirmary.—Medical Superintendent. Salary, £130 per annum, with board, apartments, &c. Applications to the Secretary before Jan. 23.

Celbridge Union, Kilcock Dispensary.—Medical Officer. Salary, £115, with fees, &c. Election, Jan. 14.

City of Dublin Hospital.—House Surgeon. Salary, £100 per annum. Full particulars on application to Surgeon Wheeler, 27 Lower Fitzwilliam Street, Dublin. (See Advt.)

Clogheen Union, Ardfinane Dispensary.—Medical Officer. Salary, £100, with fees, &c. Election, Jan. 20.

Clonmel Union, Ballymacarbry Dispensary.—Medical Officer. Salary, £100, with fees, &c. Election, Jan. 13.

Limerick Union Workhouse.—A Resident Apothecary or Pharmaceutical Chemist. Salary, £150, with apartments. Election, Jan. 15.

Longford Union, Killashee Dispensary.—Medical Officer. Salary, £120, with fees, &c. Election, Jan. 14.

Melton Mowbray Union.—Medical Officer for the Waltham District. Salary, £40, with extra fees. Applications to the Clerk, Union Offices, Melton Mowbray.

Rotherham Hospital.—Resident House Surgeon. Salary, £100, with board. Address the Hon. Sec. on or before Jan. 23.

Settle Union.—Medical Officer for the District and Union. Salary, for the former, £25; the latter, £25, with the usual extras. Apply to the Clerk of the Union on or before Jan. 20.

Swinford Union, Kilkelly Dispensary.—Medical Officer. Salary, £100, with fees, &c. Election, Jan. 18.

University of London.—Registrarship. Salary, £800, increasing £25 until the maximum of £1,000 is reached. Applications not later than Feb. 1.

Whitechapel Union, London, E.—Assistant Medical Officer for the Infirmary. Salary, £150. Applications to the Clerk, Union Offices, Whitechapel, E.

Wigan Union, District and Union.—Medical Officer. Salary, £130, with the usual extras. Apply to the Clerk of the Union before Jan. 15.

## APPOINTMENTS.

COLLETT, R. W., M.R.C.S.E., Resident Medical Officer to the Ramsgate Royal Dispensary and the Seamen's Infirmary.

ELLIS, T. S., M.R.C.S.E., a Consulting Surgeon to the Gloucester General Infirmary.

HORDEN, J. O., M.B., C.M., L.R.C.P.Ed., L.R.C.S.Ed., Resident Medical Officer to the York Dispensary.

JONES, D. J., C.M., M.R.C.S.E., Junior Assistant Medical Officer to the Gloucestershire Lunatic Asylum.

KEBBELL, W., L.R.C.P.L., M.R.C.S.E., Senior Assistant Medical Officer to the Gloucestershire Lunatic Asylum.

MACAULIFFE, A., L.R.C.P.Ed., Medical Officer and Medical Officer of Health for the Kilgarvan Dispensary District of the Kenmare Union.

MACMILLAN D., M.B., C.M., Medical Officer and Medical Officer of Health for Kilcalmonell and Kilberry, Knapdale South, and Saddell and Skipness, Argyllshire.

MACNAUGHTON, W. A., M.B., C.M., Medical Officer for the South District of the Parish of Great Yarmouth.

SHANAHAN, John Francis, L.R.C.S.I., L.K.Q.C.P.I., Medical Officer Adare Dispensary, Croom Union.

## Birth.

BRODIE.—Dec. 2, at Kurrachee, India, the wife of Surgeon-Major J. F. Brodie, of a daughter.

MOORE.—Dec. 26, at Cavan, the wife of Mark Moore, L.R.C.S.I., of a daughter.

PALMER.—Dec. 26, at Durrow, Queen's County, the wife of John R. Palmer, L.R.C.S.I. & L.K. & Q.C.P.I., of a son.

SMITH.—Jan. 1, at Croydon, the wife of W. H. M. Smith, L.R.C.P., of a son.

## Marriage.

JOHNSTON—STAPLETON.—Jan. 2, at Castleblaney, co. Monaghan, Henry Maturin Johnston, M.D., L.R.C.S.I., to Mellicent Agnes Blennerhassett, youngest daughter of the late David Stapleton, Esq., R.N.

## Deaths.

BLAKE.—Dec. 20, at Beaufort Villa, Cumberland Road, Bristol, Frederick George Blake, L.R.C.P.L., aged 27

BUSFEILD.—Dec. 28, at his residence, Booth Fold, Newchurch, Harcourt M'Leod Busfeild, M.D., in his 37th year.

CAMPBELL.—Dec. 26, at Knock House, Sleat, Skye, suddenly of cerebral apoplexy, Edward Eilice Campbell, M.B., C.M., Parochial Medical Officer, Sleat and Strath.

DIXON.—Dec. 31, at Penrith, George Dixon, M.D., M.R.C.S., late of Thames Ditton, aged 38.

O'DONNELL.—Dec. 15, at Astaki Bay, Sea of Marmora, Joseph Francis O'Donnell, M.B., Surgeon H.M.S. *Thunderer*.

REID.—Nov. 20, at Rosalie Beau Bassin, Mauritius, Francis Reid, M.D., C.M.G., Inspector of Hospitals.

RINGROSE.—Dec. 28, at Wood Green, John Ringrose, M.R.C.S.E., aged 74.

ROBINSON.—Dec. 25, at Charlotte Street, Christ Church, Surrey, John Robinson, M.B, aged 85.

SHORTO.—Dec. 25, at West End, Southampton, James Shorto, M.R.C.S.E., aged 71.

SNAPE.—Dec. 25, at Millbrook Road, Brixton, William Heathcote Snape, M.R.C.S.E., aged 65.

STABB.—Dec. 26, at Montpelier Terrace, Ilfracombe, Thomas Stabb, aged 78.

SMITH.—Dec. 23, at Derry, Charles Smith, M.D.

TYRRELL.—Dec. 31, at 13 Merrion Square North, Dublin, Henry J. Tyrrell, F.R.C.S.I., M.R.I.A., &c., aged 45.

## Clinical Lectures

ON THE

## PATHOLOGICAL ANATOMY OF THE LUNGS.

By Professor CHARCOT,

Physician to the Salpêtrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

(*Continued from page* 24.)

### V. Visceral Epithelial Cirrhoses in General.

In finishing the preceding lecture I brought forward an anatomo-pathological character common to certain forms of sub-acute or chronic broncho-pneumonia. As you will remember, this consisted in the fact that whilst the wall of the respiratory canaliculi is transformed into embryonic tissue, the endothelial investment is replaced by an epithelium of the cylindrical type, and analogous consequently to that which lines the bronchi. I cited as examples, *fibroid pneumonia* of tuberculous patients as described by M. Thaon; the *lobular pneumonia* of syphilitic infants after Cornil and Ranvier; the case of *carnification* of the lung described by Legendre and Bailly which represents, as I believe, in the chronic state common broncho-pneumonia. I should have added, that in those animals whose recurrents were divided who survived some weeks the results of the operation, M. Friedlander has met with alterations in the lungs closely analogous to those which I have briefly described to you in man. In all the cases I repeat, with respect to the lesions of the respiratory canaliculi, two elements may be distinguished, cellular vegetation of the connective wall of the alveoli leading to destruction of the special elements of the region, that is to say, muscular fibres of organic life, bundles of elastic fibres, &c.; (2) substitution of an epithelial investment of cylindrical type for the investment of flat cells, morphologically endothelial, which exist in man after birth in the normal state. We must now recal some details of elementary embryology which I brought before you in a former lecture. Recal to mind the first details of the development of the lung. You know how the two swellings or diverticula appended to the posterior extremity of the œsophagus are composed of two very distinct parts:—

1. A layer of *hypoblastic* cells, soon represented by an investment of cylindrical epithelium extending through the whole of the respiratory channels.

2. A thick layer of mesoblastic tissue, at the expense of which are developed the muscular and elastic elements, the vessels, &c. (Fig. 16.)

FIG. 16.

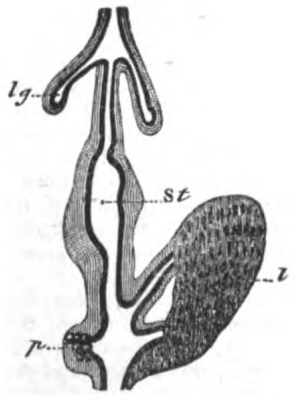

Diagram of a portion of the digestive canal of a chicken at the fourth day. The internal black line represents the hypoblast, the outer lighter part the mesoblast. *lg*, Pulmonary diverticulum, presenting a terminal swollen extremity, forming the primitive pulmonary vesicle. *St* Stomach. *l* Two hepatic diverticula, the terminal extremities of which are united by uninterrupted rows of hypoblastic cells. *p* Pancreatic and vesicular diverticula. (Foster and Balfour).

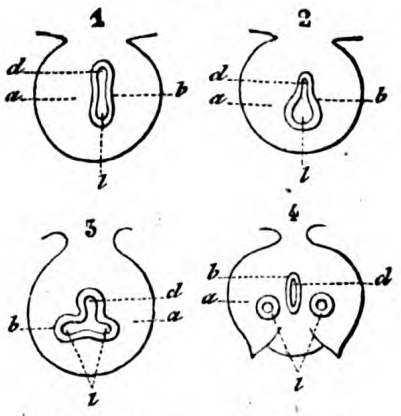
To return to the sub-acute and chronic broncho-pneumonic lesions on which I have just treated, it is interesting to see, I told you, the epithelial investment, originating from the hypoblast, take, under the influence of an irritative process, the form which it presents in intra-uterine life, at the same time that the walls of the alveolus, which in their first development arise from the mesoblast, also take the embryonic character.

FIG. 17.



Four diagrams to show the formation of the lungs. *a*, Mesoblast. *b*, Hypoblast. *d*, Cavity of the digestive canal. *l*, Cavity of the pulmonary diverticulum. In 1, the digestive canal has undergone a strangulation, which separates it into two channels, the one superior, the other inferior; the first is the true alimentary canal, the second the pulmonary tube; they are in communication with one another. In 2, the inferior (pulmonary) tube is the larger. In 3, the enlarged portion is divided so as to form two canals, communicating with one another, and both with the digestive canal. In 4, they are completely separated from one another, as well as from the digestive tube; the mesoblast has also begun to show signs of the internal changes which are produced. (Foster and Balfour).

Incontestably this is, I repeat it, a remarkable incident in the anatomical history of chronic broncho-pneumonias. The fact will appear to you, doubtless, still more worthy of interest if I show you that it is reproduced with the same characters and the same signification in some varieties of interstitial inflammation, *cirrhoses* (if you like to call them so), which attack other viscera than the lungs. I have already shown you that in my opinion this is not merely a partial fact or episode, but an anatomical character common to an entire group of *visceral cirrhoses* belonging consequently to the domain of general pathological anatomy. The following details will justify the proposition which I have just enunciated afresh. Recalling to mind our studies of last year on the diseases of the liver, bile ducts, and kidneys, I propose to examine from the special point of view to which I have directed your attention, first, the case of the kidney, then that of the liver. I shall lead you into a digression which will conduct you apparently a little away from the immediate aim of our actual studies; you will not regret this if I am able to make you feel that considerations such as those which are about to be presented to you, may contribute, some day, to relieve the chapter of chronic pneumonias from the obscurity which, up to the present time envelopes it at more than one point.

I. I will first bring forward the example of the form of chronic interstitial nephritis which, in the language of macroscopical anatomy, bears the name of *contracted kidney*, *small red kidney*, *gouty kidney*, and *granular kidney*, titles borrowed, as you know, almost all of them, from English nomenclature. This is, I think, from an anatomical, as well as from a nosographical, point of view, a species, distinct from another form of renal affection, belonging itself to the old class of Bright's disease, a form in which the organ is equally atrophied, *cirrhosed*, and which Dr. G. Johnson has called *small yellow kidney*; others call it *small fatty kidney*, and *mottled kidney*. This last variety of renal alteration is connected, as Dr. Johnson has shown, with the history of *parenchymatous nephritis*, of which it represents an advanced stage. It has nothing in common with the alteration called the *small red kidney*, except that it is situated in the same organ of which it causes sclerous atrophy, and reveals itself clinically by a certain number of analogous symptoms; a circumstanee which need not surprise us, since the two affections have the same organ for their principal foundation. (*a*)

I recal, in passing, this distinction between the *small yellow* or *fatty kidney*, and the *small red kidney*, because the anatomical grounds on which it is based do not appear to me to be sufficiently recognised, if I may judge at any rate by certain critical articles recently published, which review my instruction of three years ago, and whose conclusions differ from those which I put forward at the time. It is in the region of the labyrinth that the lesions in the case of the small red kidney are especially situated. I have endeavoured to establish with M. Kelsch that the atrophy of the labyrinth and the relative integrity of the medullary radii explain the existence of the *granulations* which project on the surface of the organ, and appear pale on a red ground. The red and depressed parts answered to the labyrinthine region or atrophied *canaliculi contorti;* the clear projecting parts, granulations in fact, to the central region of the lobule, in other words to the medullary radii composed especially of secreting canals and remaining relatively healthy.

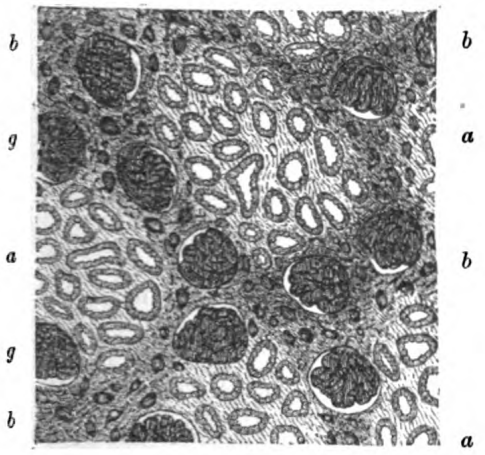
Histologically, these facts predominate; 1, the glandular epithelium of the convoluted tubes as the result of various alterations, presents a granulo-fatty change, and finally disappears; 2, at the same time the connective tissue which serves to support these tubes undergoes embryonic growth, and is developed in excess. This is the point to which I wish to-day very specially to draw your attention. At a given period of the process the granular glandular epithelium, which in the normal state lines this part of the uriniferous tubes is replaced by a cuboid epithelium resembling morphologically the cylindrical epithelium of the collecting tubes. This modification of the epithelial investment has been described by all authors who have studied the histology of the contracted kidney, G. Johnson, Cornil and Ranvier, Kelsch, &c. (Fig. 18.) It appears to be a fundamental character in the pathological histology of the small red kidney, and if it be met with in other forms of renal sclerosis, it is then never more than a partial, and to some extent, accidental fact.

You will easily see the analogy which I wish to establish from an anatomo-pathological point of view between the form of renal cirrhosis to which I call your attention and broncho-pneumonic cirrhosis. The relation will appear to be more striking if I recal to your mind, in connection with the kidney, as I did just now *à propos* of the lung, some embryogenic details. From the second day in the chicken we see a group of cells on each side of the middle undivided part of the mesoblast, outside the proto-vertebra, between them, the epiblast, and the mesoblast. This is the first rudiment of the Wolffian body. The mass in question, composed of mesoblastic cells, is soon hollowed out into a small cavity which is seen lined with cylindrical cells. It is thus that the canal of Wolff is formed. Whence come the cylindrical cells? Waldeyer supposes, but this is purely theoretical, that they are of epiblastic origin, and that they have been by a sort of inclusion separated from the epiblast at the period of the apparent union of the epiblast and mesoblast. However that may be, about the fourth day the structure of the Wolffian body begins to be seen. We see then a series of convoluted tubes brought together into the canal of Wolff, and ending in the vascular glomeruli, which during this time are formed in the thickness of the mesoblast. The mode of development appears to be as follows: from the anterior part of each canal arise on the

(*a*) G. Johnson, "On the Forms and Stages of Bright's Disease of Kidneys." Med. Chir. "Transactions," vol. xlii. 1853.

internal surface diverticula which lengthen, little by little, and form tubes folded on themselves. These tubes are, like the canal of Wolff itself, lined by a cylindrical epithelium always thicker than in the first case. Such is, in brief, the first development of the Wolffian body,

FIG 18.



Section of a Contracted Kidney, perpendicular to the direction of the Lobules. The clear parts *a*, forming granulations correspond to the centre of the lobule, and represent sections of the collecting tubes. The shaded parts *b*, are composed of the convoluted tubes, atrophied by the newly-formed embryonic tissue, and of the glomeruli *g*. (Semi-diagrammatic figure, after preparations by Kelsch.)

FIG. 19.

Atrophied uriniferous tubes, containing small cells partly disintegrated, and fatty granules. X 428

which is called primitive kidney; as for the definitive kidney, which alone here concerns us, it is developed soon after on exactly the same model in the sheep as well as in the chicken by a prolongation from the posterior part of the Wolffian body. We now see that the comparison of the lesions of broncho-pneumonic cirrhosis with those of the small red kidney shows us that in both cases the fundamental process has, *mutatis mutandis*, the same basis, viz., a return to the embryonic state of the elements originating from the mesoblast, and as regards the epithelial investment, a tendency to the reproduction of the character of the fœtal state.

*(To be continued.)*

# Original Communications.

## ON PERIODICAL HÆMOGLOBINURIA.

BY PROF. L. LICHTHEIM, M.D.

Translated from the *Allgemeine Wiener Medizinische Zeitung*

By J. C. COPLAND, M.R.C.S.,

Member of the Court of Examiners, Apothecaries' Society.

THE complex symptoms which characterise this very rare affection are, on the whole, well marked. The patient suffers severe paroxysms of fever which very closely resemble an attack of intermittent fever, but they are of shorter duration, and are quickly followed by a discharge of urine containing hæmoglobulin. Observe, however, that this disease is no ordinary hæmaturia, but that the urine discharged during a paroxysm of this fever contains actually a solution of hæmoglobulin. It has, indeed, completely the colour and the peculiarities of lac-coloured blood, the blood corpuscles of which have through some cause or other been broken up, and their hæmoglobulin set free in the serum. Hence the urine is almost absolutely free from red blood corpuscles, as may be proved by microscopical examination. If it be boiled it is seen to contain a quantity of albumen, which, however, is not precipitated in the usual manner, but forms itself into a consistent brown scum, or curdled mass, which floats on the surface of the urine. This scum will be found to give all the usual re-actions of hæmoglobulin.

Through the loss of the colouring constituents of the blood the skin of the patient has a waxy appearance, and the external mucous membranes are of a pale colour. Each attack commences with a dragging sensation in the loins, a feeling of general *malaise*, great feebleness, followed by a long rigor, and, after the hot and sweating stages, terminating in complete recovery. The urine at first passed is of a dark-red colour, afterwards it becomes clearer, while that which is passed last of all is perfectly free from hæmoglobulin.

The attacks of this disease are quite absent during the hot season of the year, returning in the course of the autumn and winter, and all patients who have suffered from it feel certain that the complaint has been occasioned by a "cold," or, more correctly speaking, by the effect of a low temperature upon their skin. Moreover, all the patients agree in saying that they are remarkably susceptible to cold, so that an attack of the complaint may in them be brought on by a degree of cold which would have no effect upon a person in health. An English writer (Hassall) has on that account called the disease "Winter Hæmaturia." Hence a patient may be attacked with the disease if he happens to take a cold bath when the weather is cold, or if he gets very wet.

As regards the seat of the disease, the symptoms are very trifling. One constant symptom is great sensibility to pressure in the neighbourhood of the kidneys; and sometimes there is enlargement of the liver and spleen. Œdema is always absent. The blood is remarkably pale, and a microscopical examination shows a great diminution of its colouring matter. From a number of physiological experiments, as well as from the phenomena observed in patients who have, while suffering from the disease, been submitted to the operation of transfusion, we may conclude that we have here a destruction of red blood corpuscles and an escape of their hæmoglobulin into the blood; but what occasions this destruction is more than we can say, as we are entirely ignorant of the essential nature of the disease. Nor have any post-mortem examinations thrown any light upon the question, as at present no one has died from this strange affection. It is, however, worthy of remark that hæmoglobinuria is apparently confined to the male sex.

With regard to the progress and treatment of this disease I may remark that however weak and miserable patients are immediately after the paroxysm, they quickly recover during the intervals of the attacks, and even regain their natural colour and appearance. When summer has put a temporary stop to the disease, the strength of the patient becomes completely restored. The progress of this affection is tedious, but its prognosis favourable.

With respect to treatment, English writers have recommended quinine and the preparations of iron. But those means are scarcely sufficient to protect the patient from the injurious influences which appear to occasion the paroxysms. This is best effected by warm clothing, and

by the patient keeping to his room during rough weather. During the attack itself he should keep to his bed, and wine or some other alcoholic stimulant should be administered during the cold stage.

# Clinical Records.

## ST. PETER'S HOSPITAL.

*Stone in the Bladder of an Old Man—Lithotrity—Erysipelas—Death.*

Under the care of Mr. TEEVAN.

WILLIAM P——, æt. 72, by occupation a gas-fitter, was admitted into the hospital on Nov. 19, 1877.

*History.*—From notes taken by Mr. Arthur Simon, the House Surgeon, it appeared that one year ago the patient began to experience great pain when he passed water, which he was frequently obliged to do. Three months ago blood escaped when he urinated. The patient was born at Brighton, but was not aware of the birthplace of his parents. He was so very deaf that only an imperfect history of the case could be obtained.

*Condition on Admission.*—The patient was very emaciated, feeble, and haggard-looking. He was unable to ride in an omnibus on account of the pain he suffered. Was very frequently obliged to make water and found that the stream of urine would often stop and then commence to flow again. There was but little mucus or pus in his water, which was faintly acid, with a sp. g. of 1015. The man was sounded by Mr. Teevan, who found a stone apparently of medium size, but as the patient was so debilitated, deferred any interference till he had been kept at rest and well fed for some time. He was also ordered henbane and potash to relieve local symptoms.

*Treatment.*—On Nov. 28, at 3 p.m., the patient was put under the influence of gas and ether by Mr. Knott. Mr. Teevan then introduced a medium-sized lithotrite, and having found the stone to be 1¼ inches by 1 inch in its diameters, he there and then crushed it.

29th.—Patient has had a good night. Micturition is painful and slightly bloody. At 8 p.m., temp., 101; pulse, 80.

30th, 10 a.m.—Had some shivering in the night, but feels more comfortable this morning. Passes water in a small stream. Tongue, dry and brown. Bowels open. Pulse, 94; temp., 100·6. Only a little *débris* has come away.

Dec. 1st.—Had a bad night. Bowels rather relaxed. Ordered ten grains of chloral.

2nd, 9 a.m.—Had another bad night. Suffers a good deal of pain. Tongue, parched. Pulse, 92; temp., 98·5. 11.45 a.m. As the patient was unable to make water on account of a piece of stone impacted in the prostatic urethra, Mr. Teevan introduced a lithotrite, pushed the fragment back into the bladder, and crushed it together with some other pieces. 10 p.m. The patient has had a slight rigor. An ordinary elastic catheter was passed to ascertain if patient emptied his bladder. Urine, bloody; pulse, 100; temp., 101·1.

3rd.—Has had a very good night; felt much better this morning. Pulse, 88; temp., 97. At 3.30 a catheter was introduced; the water which escaped was bloody. 10.30 p.m. Has taken food well. Pulse, 100; temp., 99.

4th.—Had a restless night; bowels relaxed. There is an erythematous blush over the right side of face and neck, which is swollen and tender. Ordered hot fomentations, brandy, and carbonate of ammonia and bark. 10 p.m. Temp., 99; pulse, 120; bowels have been very loose all day.

5th, 9 a.m.—The erysipelas has increased; pulse, 110; temp., 98·5. The urine drawn off was quite clear. 9 p.m. Temp., 100·5; pulse, 120.

6th.—Passed a better night; pulse, 114, intermittent; temp., 99, very feeble. 10 p.m. Pulse, 130; temp., 99·5. The erysipelas has increased; patient sinking.

7th.—9 a.m. Pulse scarcely perceptible. Patient died at 3 p.m.

Permission could only be obtained to examine the urinary organs, which was done on Dec. 8, at 9 a.m. The bladder was fasciculated, and its mucous membrane congested. The body of the prostate was enlarged, and the third lobe the size of a hazel-nut. The stone, which was phosphatic, was found broken into three pieces, which collectively weighed ℥vj. The ureters were not dilated or thickened. The right kidney weighed 4½ ozs., and the left one 5 ozs.; both were examined by Dr. Mahomed, who pronounced them to be affected by chronic interstitial nephritis.

*Stone in the Bladder—Lithotomy—Recovery.*

Under the care of Mr. TEEVAN.

ALFRED L——, æt. 10, was admitted into the hospital on Nov. 20, 1878, having been put under Mr. Teevan's care by Dr. Lloyd, Surgeon to the Lambeth Infirmary.

*History.*—The boy's mother stated that her son had suffered from difficulty in making water, and pain in the penis for three years. Latterly he had been much troubled with priapism and prolapse of the rectum. The boy and his parents were all born in London. His maternal grandfather died in St. George's Hospital after an operation for stone.

*Condition on Admission.*—The boy was thin and pale, but notwithstanding the pain he suffered, was bright and cheerful. When at rest he only experienced pain when he made water. The urine was only slightly clouded by mucus and contained no blood. He had previously been sounded by Mr. Teevan on Nov. 17 in the out-patient's room, when he detected a large stone lying at the neck of the bladder.

On Nov. 27, at 3 p.m., Mr. Knott administered chloroform to the boy, and a rectangular staff having been introduced, it was taken charge of by Mr. F. Heycock. Mr. Teevan performed the lateral operation and extracted a lithic acid calculus weighing 1 oz. There was scarcely any constitutional disturbance after the operation; the temperature as taken daily night and morning for one week by Mr. White, the House Surgeon, was found to vary from 98·5 to 99·6.

On Dec. 10 the lad began to pass his water by the penis, and on the 24th he left the hospital quite well, not suffering from incontinence.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, JAN. 10TH.

Dr. MURCHISON, Vice-President in the chair.

Dr. MURCHISON drew the attention of members to byelaw 50, which provides that, though a patient may be exhibited at any meeting, no paper on the case can be read which has not been submitted to the secretaries in the usual manner, at least one week previously. He nominated Dr. F. H. Hall and Mr. Johnson Smith to act as scrutineers of the ballot.

Mr. LAWSON read the history of a

CASE OF INTESTINAL OBSTRUCTION FOR WHICH GASTRO-ENTEROTOMY WAS PERFORMED,

which had been under the care of Dr. Cayley and himself at the Middlesex Hospital, and for which Mr. Lawson performed gastro-enterotomy.

H. C., æt. 23, a compositor, was admitted into the Middlesex Hospital under the care of Dr. Cayley on June 3, 1878. For the last six weeks he had been somewhat costive, and had suffered occasionally from colicky pains. The bowels acted every day, but the motions were scanty, and composed of small hard lumps. On May 29, while at work, he was

seized by an attack of colicky pain much more severe than the previous ones. In the evening he vomited, and he states that the matters brought up had a fæcal smell. The bowels had acted that morning, but there was no motion afterwards up to the time of his admission. During the following three days he had frequent retching, but brought nothing up, and he took no food except a little milk; the colicky pains continued unabated. His medical attendant had given him sulphate of magnesia, and several enemata. *State on admission.*—The countenance was natural and free from anxiety; the tongue was thickly coated, there was a slight blue line on the gums of the lower jaw. He complained of a twisting pain in the belly, especially on moving. It was most marked in the umbilical region, and though constant, was aggravated by frequently recurring paroxysmal exacerbations. The abdomen was considerably distended with some tenderness on deep pressure in the umbilical region. There was marked fulness in the epigastric region, below which there was a slight depression. On percussion there was tympanitic resonance in the epigastric, right hypochondriac, lumbar and iliac regions. In the umbilical the resonance was less markedly tympanitic on the left side, there was dulness in the iliac and lumbar regions, but it was noticed that the position of the dulness sometimes shifted across to the right side. The circumference of abdomen at the umbilicus was thirty-three inches. The patient belched up wind, but had passed none per anum since the 29th. The urine was abundant; sp. gr. 10·37; free from albumen. Resp. 24; temp. 99·2; pulse 108. The patient was placed on his elbows and knees, and a flexible tube passed as high as was practicable; and an enema of warm water administered by a syphon from a vessel placed eighteen inches above the level of the anus. It was not found possible to administer more than two quarts of fluid, which caused considerable distress from a feeling of distension. The enema returned quite free from fæcal matter. Digital examinations of the rectum gave negative results. Ordered extract opii, gr. ½, every four hours. After two pills, the pain was relieved, and the patient fell asleep. The patient continued to get worse, the pain increased, the belly became more distended, and in June 5, he vomited a flaky yellow fluid, with a distinct fæcal odour. On June 6th. The symptoms still unrelieved, notwithstanding repeated doses of opium, and repeated enemata. He continued to vomit stercoraceous matter. The temperature had risen to 101·2; the belly was more distended, and there was tenderness. As peritonitis was beginning, it was thought that further delay in resorting to an operation was undesirable. It was therefore decided that a search should be made for the obstruction. The patient having been placed under ether, Mr. Lawson made an incision in the median line of abdomen, commencing just below the umbilicus. The coils of intestine were seen greatly distended, and with a red velvetty appearance, but still shining, and without any deposit of lymph on them. On passing his hand into the abdomen, Mr. Lawson felt a portion of the intestine tightly distended to beyond the size of the adult stomach, and extending from just below the liver on the right side downwards to the right iliac, and across the belly to the left iliac region. From the fixity of the intestine, he concluded that it was the cæcum. He failed to detect any band or constriction, or collapsed portion of the intestine. He now endeavoured to unravel the small intestine by withdrawing it, and replacing it through the wound coil by coil; but this proceeding was found impracticable, in consequence of the excessive distension of the gut. A considerable portion of the intestine was therefore withdrawn from the abdomen to give room for further exploration; and on again introducing the hand, nothing could be detected but the enormously distended piece of intestine which was supposed to be the cæcum. This portion of the viscus was now punctured with a large trocar close to the lower end of the wound in the abdominal walls, and a large chamber-vessel full of liquid fæces was drawn off. The canula was now withdrawn, and a large india-rubber tube, about six inches in length, and the size of the finger in circumference, was introduced through the opening the trocar had made, and the end of the tubing was brought out through the bottom of the wound in the abdominal walls. A single suture was applied to one edge of the opening in the intestine, and [fastened to the lower cut edge of the abdominal wall, but owing to the fixity of that portion of the intestine, it was found impossible to draw it sufficiently forward to unite it completely to the edges of the external wound. The intestines were then, after some difficulty, returned, and the wound closed with sutures in the usual manner. The parts were dressed with carbolic oil and a compress, and a well-fitted bandage applied to keep the whole *in situ*. During the progress of the operation, as the intestines were drawn from the abdominal cavity they were covered with flannel, made moist and warm, by being wrung out of hot water. This flannel happened to be quite new, and consequently the fluff from the flannel adhered to the peritoneal surface, and remained attached where the bowels were replaced into the abdomen. The small intestines as before stated, were greatly distended, so as to approach in size the normal colon. In returning these into the abdomen, the peritoneal coat in two places cracked to the extent of about three-quarters of an inch. Each of these peritoneal wounds, Mr. Lawson closed with a continuous suture of fine silk, such as is used in operations on the eye. Taking care that the needle perforated only the peritoneal covering, and did not wound the muscular coat of the bowel. The patient was then returned to bed. A profuse discharge of liquid fæces continued to take place through the tube. The next morning his pulse was 160, small and sharp; temp. 103. Belly much distended, has had no more vomiting, and has passed flatus per anum. A free discharge of fæces continues through the tube. He continued to improve from this date; he had no further vomiting, and on the 11th, the fifth day after the operation, he passed a copious semi-fluid motion per anum. After the stitches were removed, the abdominal wound gaped a little, but the edges were kept in apposition by adhesive plaster and a bandage round the abdomen, and ultimately the wound united by granulation, leaving at the lower end a small fistulous track, through which a small quantity of fæces continued to escape. The patient left the Hospital for the Eastbourne convalescent establishment in the second week of October, but after having been there a fortnight, he was sent back with symptoms of obstruction, and distension of the belly. A large enema gave him relief, but, unfortunately, he has had several recurrences of obstruction. The bowels seem to have lost much of their power of propelling onwards their contents, and as they have, probably, become more or less adherent to the walls of the abdomen and to each other, a complete block may at any time occur, for which a right lumbar colotomy will afford the only chance of relief.

Dr. MURCHISON, after congratulating Mr. Lawson on the fortunate termination of this case, remarked that it gave fresh evidence of the remarkable toleration of interference by the peritoneum sometimes witnessed; and related a case where a boy had sustained a laceration of the abdominal wall whilst bathing, which was followed by protrusion of the intestines. These, although covered with sand, were successfully replaced by the medical man, after the sand had been washed off as completely as possible. The boy recovered. He regretted that in the paper no definition of the cause of the obstruction had been given. It was clearly not of the nature of intussusception, but was seated low down in the colon; and he asked Mr. Lawson to favour the meeting with his opinion.

Mr. LAWSON replied that he believed the obstruction to have been caused by a kink in the intestines, which had been straightened by the manipulation.

Dr. CAYLEY added that the seat of the obstruction was uncertain before the operation; it was believed to be low down in the large intestine, though it must be remembered that two quarts of fluid were retained. As to the nature of the hard swelling in the left groin, it would hardly be considered fæcal, for it remained unchanged after several free evacuations of the bowels. The probabilities were in favour of its being inflammatory, for it had remained stationary and not diminished in size—facts which seemed to exclude the diagnosis of a tumour.

Mr. CRIPPS was reminded of a case which he brought before the Society last year. The symptoms had been sudden and severe. Through a small incision the intestine had been explored; a band discovered, and divided after an enlargement of the first cut. The operation, however, which was done antiseptically, had been followed on the ninth day by a fatal result, which he was inclined to attribute to the delay and consequent exhaustion that had followed a temporarily successful use of opium. In his opinion the necessary delay constituted a serious objection to the employment of this drug.

Mr. BRYANT congratulated Mr. Lawson on the result of his case, one which could have hardly been anticipated. The history, he thought, pointed to an acute obstruction added to

some chronic trouble, such as might be caused by a matting together of a part of the intestine by previous peritonitis. A point of great importance in these cases was to operate early—in fact, immediately a mechanical obstruction was diagnosed. No doubt in this case lumbar colotomy would have been sufficient, though this could hardly have been anticipated; but he thought that opening the bulging intestine in the flank would have been here the best procedure.

Mr. THOMAS SMITH allowed that waiting was prejudicial; but the first point was to make a diagnosis, and this was often most difficult. He recalled a case where sudden pain and vomiting had set in. The patient remained in the hospital for fourteen days, and died unrelieved, for at that time abdominal section was not readily undertaken. The post-mortem disclosed an acute enteritis with a sloughing patch of intestine, such as no operation could have benefited. Three days ago he saw a boy who had been attacked, shortly after Christmas, with vomiting and sudden pain. The abdomen was not much distended, and mucus was passed *per anum*. He had diagnosed an enteritis, but after death a band was found strangulating a diverticulum of small intestine. In another case there had been the same symptoms of acute strangulation, where he had diagnosed volvulus. An operation through a small opening was performed; a band was found, and the intestine released; but the patient, who had taken the anæsthetic badly, died in half-an-hour, from the effect of the ether as he believed.

Mr. HULKE quite agreed that the diagnosis was often a matter of great difficulty; the acuteness of the vomiting and the seat of the pain he had often found fallacious guides. In one case, where the symptoms were acute and severe, they were found to depend on an abscess in Douglas' pouch. In a second, when the vomiting was immediate and uncontrollable, the obstruction was at the lower end of the small intestine. Having had an opportunity of witnessing the present operation, he still believed the obstruction to have been caused by a band constricting the hepatic flexure; and the cause of this band was to be sought in the history of the burn, and its attendant suppuration—conditions which were known to be often followed by peritonitis or ulcer.

Mr. HEATH criticised the treatment of the distended intestine by puncturing it with a trocar and inserting a drainage tube, while no attempt was made to attach the intestinal wall. Escape of the intestinal contents might so easily have taken place into the peritoneal cavity. He also thought the probability of a band constricting the colon in some part of its course was great. He referred to Mr. Teale's treatment of a similar case who had, without opening the intestine, closed the abdominal wound and done a lumbar colotomy, and thought that this would be a better treatment to adopt in future.

Dr. BUZZARD believed that the future history of this case would be still more interesting. The fact that two quarts of fluid were retained negatived, in his opinion, the idea that the obstruction could be low down. For his part he thought the treatment adopted had not conduced to the man's recovery. He quoted the case of a young man who had recovered from two attacks of obstruction, one of which, at least, he believed, to have been dependent on a strangulating band, under a free administration of opium.

Dr. YEO had received an altogether different impression from the history. A distended condition of the intestine had been described which it would have been useless to treat by opium, a treatment which, in his opinion, had been too often fatal.

Mr. HOWSE could not agree that in this case nothing had been done to relieve obstruction. The mere emptying of the intestines was often enough where a band was the cause of the strangulation, just as in a strangulated hernia evacuation of the contents of the bowel often allowed replacement to be effected. He allowed that the diagnosis of such cases was often difficult, but the treatment of a clear case of mechanical obstruction by opium could only be prejudicial. After tapping it was a serious objection that the puncture so often allowed oozing to occur. It was of little use then to sew up the hole; the punctures by the needle increased the difficulty.

Mr. HULKE entirely agreed with the remarks of the last speaker, that to tie the puncture often added to the danger, for in spite of all care the intestinal wall was most easily cut through by the ligature.

Mr. CROFT considered that here the value of antiseptic precautions was most valuable; flannel, which had been objected to by Mr. Bryant, for covering the protruded intestine was perfectly harmless if antiseptic. The peritoneum tolerated larger and harder foreign bodies than the hairs from flannel, provided that they were antiseptic.

Dr. STEWART wished to call attention to the importance of substituting belladonna for opium in the treatment of such cases.

Dr. CAYLEY, in replying, said that he was responsible for the delay in operating, but he could not allow that the symptoms were too urgent for this delay. Just before the operation the man had been reading the newspaper.

Mr. LAWSON added that he had no alternative but to puncture the intestine, otherwise the small gut could not have been replaced. Dr. Buzzard, he thought, had not noticed that the fæcal vomiting which had existed for twenty-four hours before the operation, had, after it, ceased, and the patient uninterruptedly got well.

The Annual Report was then read by Dr. CAYLEY as follows:—

The Council of the Clinical Society, in presenting the 11th annual report, is again able to congratulate the members on the continued prosperity of the Society, as shown by increasing members, and full attendance at the meetings. During the past year, twenty-one new members were elected, two members died, viz., Mr. Hilton, an original member, and former Vice-president, and Mr. Esra Hunt. The Society has also to deplore the loss of one of its most distinguished foreign honorary members, Baron Rokitansky. Three members have withdrawn, leaving a net increase of sixteen ordinary members. The Society now comprises 250 ordinary resident members, fifty-five non-resident members, and thirteen honorary members, making a total of 318. The treasurer's balance sheet shows an income for the year of £533 14s. 5d., including a balance for the previous year of £211 16s. 7d., and an expenditure of £280 6s., leaving a balance of £253 8s. 5d. The Society holds £400 consols. The 11th vol. of the Transactions is more richly illustrated than any of the preceding ones, and the Council trusts that the increased outlay upon it has produced satisfactory results. The Committee appointed to investigate the "Incubation Period of Certain Contagious Fevers," and the "Effects of Prolonged and Continuous Use of Chloral," have not yet completed their labours, and have applied for an extension of time before sending in their reports. In conclusion, the Council is desirous of impressing upon the members the necessity of complying with the regulation which requires the reports of cases to be sent on to one of the Secretaries a week before it is intended to read them, the increasing numbers of the communications renders the observance of this rule essential to the proper working of the Society.

Its adoption was moved by Dr. STEWART, and seconded by Dr. SOUTHEY.

Mr. BROWN proceeded to draw attention to the manner of electing the officers of the Society, but

Dr. MURCHISON pointed out that the best course would be to address a letter to the Council on the subject.

A vote of thanks to the retiring President, Mr. Callender, was moved by Mr. MACCORMAC, and seconded by Mr. HOWSE.

Mr. HULKE moved a vote of thanks to the Treasurer, Dr. Greenhow, which was seconded by Dr. CHOLMELEY.

Mr. S. WELLS moved a vote of thanks to the retiring officers, which Dr. BURNEY YEO seconded.

The meeting then adjourned.

---

THE death-rate in the principal cities and large towns of the United Kingdom last week was:—Portsmouth 20, Brighton 20, Oldham 25, Edinburgh 25, Sheffield 26, Newcastle-upon-Tyne 26, Nottingham 27, Leicester 27, Sunderland 27, London 27, Leeds 28, Bradford 28, Hull 29, Glasgow 30, Birmingham 30, Liverpool 33, Bristol 33, Plymouth 36, Norwich 36, Manchester 37, Wolverhampton 37, and Dublin, the highest of all, 51. Scarlet fever showed fatal prevalence in Sunderland, Birmingham, and Oldham. Small-pox caused 13 deaths in London, and 22 in Dublin, but not one in any of the nineteen large provincial towns.

# Department of Lunacy.

## INTRODUCTORY.

In our last number we informed our readers that it was our intention to devote some of our space to the discussion of matters of interest in connection with Lunacy.

We have had the matter under our serious consideration as to the best means of furthering the end, and we have decided to devote a portion of our columns every fortnight to this subject, and we trust that all those interested in the question will assist us by forwarding to our office any material which bears directly on Lunacy. And here let it be understood that we do not, nor do we intend to, represent the exclusive views of any party or clique, nor the special interests of public or private asylums. As with every other department of this journal, this will be open to the free and impartial discussion of every phase and interest—political, social, and clinical.

At the present time we read in the Report of the Commissioners in Lunacy that there are 68,538 persons of unsound mind in England and Wales actually under certificate, and confined as lunatics. Of this number, 37,763 are in county or borough hospitals, and 4,202 in provincial and metropolitan licensed houses. The remainder are distributed in the naval and military hospitals, in registered hospitals, as single patients; and 11,859 are resident in ordinary workhouses.

To protect and watch over these lunatics a Parliamentary Committee was appointed to inquire into alleged abuses; and their Report is now before Parliament. Mr. Cross, in reply to a question put to him by Mr. Taylor, at the end of the late Session, stated that it was receiving the attention of the Lord Chancellor, and that legislation would doubtless follow.

We have carefully perused this Report, but must confess that we are unable to detect any suggestion by the Committee worthy of the attention of the Legislature on the subject. A vast amount of evidence was laid before the Committee, who hopelessly failed to grasp the matter under their immediate consideration, and a verdict to the effect that no *mala fides* was proved against licensed houses was the result.

If a weary sitting of a Parliamentary Committee of three months' duration, in which matters bearing directly and indirectly on the question was taken in evidence, failed to convince the world at large that the accusations and allegations brought against asylums were groundless, surely the extraordinary meetings now being held will not do so.

The lay press have contented themselves by heaping abuse upon all engaged in cases of lunacy, heedless of the facts, and very frequently upon *ex parte* statements. Some of the medical papers have abused the authorities in lunacy, and also the proprietors of private asylums. It will be part of our duty to prove that the allegations brought against private asylums are unjust and false, or else to bring them more substantially before the profession.

In conclusion, we invite the assistance of those who are concerned in the treatment of lunacy, whether in public or in private asylums, in effecting an interchange of ideas between all who are connected with this special branch of the profession, and at the same time to enable us to carry out the undertaking in a manner which shall do justice to the importance of the subject.

The following letters have been received:—

## ONE MORE PLEA FOR THE REV. MR. DODWELL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—A friend of mine has just received a letter from Mr. Dodwell, in which he relates that the Commissioners in Lunacy, in their last visit to Broadmoor Asylum, said to him—"Mr. Dodwell, we feel sure, that you will tell the truth, and we are quite satisfied that you did not intend any harm to the Master of the Rolls." Why is it that this unfortunate gentlemen is detained so long, as if he were a dangerous lunatic? The Commissioners in Lunacy have no power to liberate him. The responsility rests with the Home Secretary, at whose instance three medical men visited Mr. Dodwell at Broadmoor, but the public are still kept in the dark as to the reasons on which they founded their opinion of his mental state at the time he fired a blank cartridge at the Master of the Rolls; and Mr. Gibson, the surgeon of Newgate, was ready to give evidence as to his sanity at the trial, when strange to say, neither he nor any medical man was called to give a professional opinion.

I remain, your obedient servant,

J. M. Winn, M.D.

Harley Street, London,
January 10th.

## A WORD FOR PRIVATE ASYLUMS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Much is being said and written at the present time on the management of public and private asylums, and, as the last eleven years of my life have been spent in these institutions, I have had opportunities allotted to few of studying the merits and defects of both classes of places, and I most unhesitatingly assert my unprejudiced belief that there is no contrast between these two distinct sort of establishments.

In private asylums I have always received all the kindness and attention that a comfortable home could afford; in sickness I was served with every luxury, and was attended upon by the proprietors and their families with assiduous care and unremitting watchfulness. In the other institutions, no matter how I suffered, or how I longed or implored for anything, there was no attention or the slightest heed paid to my sufferings; they had one and all a fixed set of rules and regulations, in some instances of the most cruel character, and beyond these they (the authorities of the asylums) could not be got to stir. I use the word "cruel" advisedly as far as common humanity is concerned. I saw no person from day to day and month to month save my attendants and the medical officer on his single hurried visit. As regards illegal detention, I thought at first that there were some cases not requiring confinement, but I had only to wait, when time invariably showed the wisdom and propriety of needful seclusion from society and the world (for their own benefit) in every case; and I have no hesitation in saying that during all these years I have never known a single case of illegal detention. Then, as regards inspection, I found the same amount of supervision by the commissioners in lunacy and the justices in the one class of asylums as in the other, and I always found that these gentlemen, one and all, paid the utmost attention to every case; but, for the very nature of things such could not exist; private asylums having become the resort for recreation and amusement in the districts in which they are situated, and where the friends of patients are allowed to visit at all times, and to mix freely with them, and to sit by their sick-bed, &c.; indeed, the comforts afforded in these asylums are such as to induce no less than six of us to take up our abode here permanently, and of our own choice and free-will, in preference to those other places of resort where people go in search of health, and peace, and happiness; and I most firmly believe that it will be a sad day and a lamentable misfortune for them (that is, the mentally afflicted) should anything come in the way, or any innovation be projected, to mar or check the usefulness of private asylums and the inestimable boon conferred by them on the unfortunates so situated as the class above-named.

I am, faithfully yours,

J. R.

C—— S——, Shropshire.

NORTHAMPTON LUNATIC HOSPITAL.

Since the beginning of the year this hospital has changed its name to St. Andrew's Hospital, Billing Road, Northampton, with the object of preventing confusion with other institutions of the same description, and bearing the same name, in or near Northampton.

## FIRST OPHTHALMOLOGICAL SOCIETY OF HEIDELBERG.

### Tenth Session.

*Extract from the "Klinische Monatsblattern für Augentreil Kunde,* 1877."

Translated from the "*Annuales d'Oculistique.*"

By ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S.I,

Sometime Ophthalmic and Aural Surgeon to the City of Dublin Hospital, and Dublin Eye and Ear Infirmary.

(*Continued from page 5.*)

Second Meeting of 18th of August.

President—Doctor Williams (of Boston).

VI.—Knies.—*Changes of Accommodation during an Epileptic Attack* (pp. 61—64).—Case of a boy fourteen years of age, who had even so many as 500 paroxysms daily. At a period of from ten to twenty seconds before each paroxysm, the arteries of the retina contracted, and did not return to their normal condition until the fit was over; the veins then became temporarily enlarged. The papilla was also affected, appearing to recoil and to diminish in size; this state of things either persisted throughout the attack, or returned by starts.

*Discussion.*

Leber has examined an analogous case, but did not find in it anything worthy of note.

Rahlmann has also examined a woman during the paroxysms, which were always preceded by a venous pulse extending rapidly to all the branches. The radical pulse showed, by means of the sphygmograph, a higher wave at the same moment.

O. Becker remarked that when rabbits are put to death by means of chloroform, at a certain moment both an arterial and a venous pulse may be observed in the eye, during a period from half to a quarter of a minute.

VII.—Lattler.—*Tuberculosis of the Eye* (pp. 64—72.)—Three cases: In the first case tuberculosis had attacked the exterior parts of the globe of the eye, the conjunctiva, the conjunctive episcleral tissue, the sclerotic, and the cornea; this had at first been taken for a case of cancer, but examination of the enucleated bulb rectified the diagnosis.

In the second case, tuberculosis proceeding from the chiasma, had extended as far as the retina. The symptoms were similar to those arising from tumour of the optic nerve. The child died of basilar meningitis some months after the enucleation. The third case had been mistaken, and with reason, for glioma.

The retina was completely detached, and had become exceedingly thickened. This was properly speaking a case of inflammation of the ciliary body of the retina, and of the choroid, with miliary tubercles in the inflammatory products.

VIII.—Kühnt.—*On the Architectonic System of the Retina.*—The author proposes, firstly, to distinguish between the nervous substance and the lamina which serves as its support, and secondly, to demonstrate the intimate connection existing between the visual epithelium and the ganglionic cells. For this purpose he has especially employed the artificial digestion of pepsine and of trypsine, following in this the example of Ewald and of Kühne, and the process of colouration by means of osmic acid, hematoxyline, and of picrocarmine. From these reseaches it results: firstly, that the molecular layer is a tissue formed of fine fibrils, dependent on the glia of the optic nerve; that, from the external portion of this tissue, corresponding to the internal nucleolei, fibres of considerable strength extend. Secondly, that these latter are furnished at different points with characteristic nuclei, that they become partly sub-divided in the intermediate granular layer, and penetrate, in part, between the external granules, where they can no longer be clearly distinguished from the system of the radiating fibres.

These researches confirm the results obtained by Merckel.

*Discussion.*

Leber has distinctly remarked, in pathological retinas, a reticular tissue in the intermediate granular layer and in the molecular layer.

IX.—Samelsohn.—*On several forms of Secondary Luxation of the Lens* (pp. 82—91.)—A.—In the first form, during the period of the swelling of traumatic cataracts, the lens turns in such a manner that the edge opposite to the lesion protrudes into the anterior chamber. The author having made experimentally a discision below, perceived that the superior edge of the crystalline advanced and fell into the anterior chamber.

*Discussion.*

V. Arlt was well-acquainted with this evolution; which, in his opinion, is simply the result of the relation of the pressures acting upon the capsule. The zonule is not necessarily torn.

O. Becker believes that this may sometimes, but not invariably, occur, as there are other cases, described by Samelsohn for the first time, in which the effect of traumatism on the zonule is such, that, secondarily, and in consequence of the enlargement of the lens, this latter, is with the capsule, detached from the zonule.

B.—In a second form, when a foreign body becomes encysted in the vitreous humour, the connective capsule is sometimes prolonged as far as that point at which the posterior crystalline capsule touches the fosse patellaire, and by the retraction resulting from its cicatrisation produces dislocation of the lens. This projection has been twice remarked by the same author. In the first case the sight was partially preserved; and the folds of the ciliary body were visible by means of lateral illumination, a fact which may be accounted for by the refraction of the dislocated lens.

*Discussion.*

Yany has observed a case in which a cicatrice of part of the corneo-scleral had produced an analagous luxation.

X.—Zehender.—*On the Chemical Constitution of the Substance of the Cataract* (pp. 91—94.)—The index of the refraction of cataracts is either very high, or much below the normal condition; the different layers of the cataract also vary greatly as to their index.

In four cataracts of high index, three contained a great quantity of cholesterine, of which the index is 1,525. In fifty cataracts, which were analysed, the cholesterine amounted to 7 per cent. The contradictory result obtained by Max Kneis, arises probably from the fact that these cataracts were preserved in alcohol, which dissolves this substance.

XI.—H. Knapp.—*On Capsulitis* (pp. 94—104).—Capsulitis shows itself in three different forms, which may be best observed if a square piece of the capsule be taken off by means of a sharp cystotome. The first form is that of simple or spreading capsulitis; this form is accompanied by little, if any, reaction; the affection extends to all parts of the capsule, and then disappears. The second form, plastic capsulitis, occurs when part of the capsule becomes enclosed in the wound. The reaction is considerable; and this form is attended with much pain during the night, injection, &c.; the pupil becomes closed, and only re-opens after a considerable lapse of time in favourable cases, while in unfavourable it shrivels, and leads to cyelitis. The third form, or purulent capsulitis, developes itself in a portion of the capsule; it is accompanied by hypopyon, and the reaction is considerable. This latter subsides in from three to five weeks; there are, however, relapses, and that frequently. These remarks relate only to primary capsulitis. The second form is the least favourable. As to the treatment for the second form, it should be slightly antiphlogistic with atropine, and the patient should remain in bed in a darkened room; in the second and third forms the treatment should be severely antiphlogistic.

As to precautions, it should be remarked that reaction is much more frequent after recent experiments with iridec-

tomy, than after the more ancient with extraction of a portion only. The extraction of a portion of the capsule does not, however, always obviate capsulitis, but the results are very favourable. Cutting completely round by means of a cross-action cystotome is the most successful method; on other occasions, when the patient is young, an incision in the form of the letter T seems preferable.

*Discussion.*

Manveg has been very successful in six cases, in which he followed the process of Wecker by means of combined forceps and scissors. Arlt, on the contrary, has abandoned this process. He thinks that it is better to practise firstly iridectomy, and at from six to eight or ten weeks later, when the membrane is thickened, dissection of the diaphragm by means of combined forceps and scissors.

Samelsohn is of the same opinion; he has adopted the process of Snellen; namely, discision of the membrane by means of a very sharp von Graefe knife.

Röder has already (at the Congress of Heidelberg in 1875) communicated a favourable series of cases of section of the capsule by means of the combined forceps and scissors. Since then he has employed this instrument on about 200 occasions with very favourable results, the details of which he hopes soon to make public.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 15, 1879.

## ORIGIN OF DIPHTHERIA IN DISEASED MILK.

It will be remembered that some time ago public attention was drawn to a fatal epidemic of diphtheria at St. John's Wood, respecting the origin of which various opinions were entertained. Some attributed it to bad drainage, some to contaminated milk. Since then an official inquiry has been made into the causes of the outbreak by Mr. W. H. Power, from which we learn that the whole of the 264 cases and 38 deaths was not due to bad drainage or to milk contaminated with sewage, as so many supposed, but to milk, *per se*, and to milk supplied by one particular dealer. In the opinion of Mr. Power, the milk, in some way or other, conveyed to those who drank it throat illness, and that in regard of each retail business, this relation of milk service to throat illness was observed for a limited period only, that period beginning for one business about the time it ceased for the other. It was further found that no external conditions, no sewage contamination, could account for this morbific agency of the milk, so that the origin of the disease appeared to be some condition of the "cow as cow, and of her milk as milk." This interesting question was, at the last meeting of the Pathological Society, the subject of a communication by Dr. Buchanan from Mr. W. H. Power. The paper was suggestive of a connection between diphtheria and diseased milk from a disease in the cow known as "garget." On the same evening the nature of this latter affection was discussed by Mr. Smee, and was referred for further investigation to a special committee nominated by the President.

Considering the supreme importance that should at the present time be attached to the etiology of diphtheria, it is to be hoped that some of our most prominent pathologists will follow up the clue which they appear to have found in the able and suggestive report of Mr. Power. That diphtheria may originate in some contagion derived from the lower animals is by no means improbable. In many respects diphtheria is allied to scarlet fever, and long ago scarlet fever, as well as small-pox, was thought to have been first generated by the lower animals. The older physicians were of opinion that it first occurred among the lower animals as a pestilence, perhaps, among horses, and was thence communicated to man. Besides, as to the probability of such contagious diseases being communicable from animal to man, Mr. Power truly observes that already we know of several diseases in the cow and other animals capable of infecting the human subject. There is vaccinia, which is well known to be *ejusden generis* with small-pox. There is the "foot and mouth" disease; which may so affect the milk secretion as to give rise to aphthous affections and disturbance of the stomach and bowels among consumers of the milk. There is miliary tubercle of the cow, which is communicable to other animals. There is the anthrax fever, which has been known to have been communicated to persons eating the flesh of cattle which have died from that disease. Then there is the parasitic disease, trichiasis; and, lastly, that terrible and fatal disease, hydrophobia. In whatever form, however, the original disease appears in the cow, it must, as Mr. Power remarks, be an affection which disturbs but little the general health of the animal, whilst affecting the quality of the milk—that is, supposing the above outbreak of diphtheria to have originated in diseased milk—inasmuch as the health of the cows which supplied the milk was not seriously affected. The results of Mr. Smee's investigation of "garget" show that there are two or three forms of this disease, one of which not only affects the health of the cow, but seems also to affect the milk in such a way that it may injure the health of calves. It is also a curious coincidence that when diphtheria broke out at the Princess Mary's Home at Woking this "garget" existed in the farm which supplied the Home with milk. Nevertheless, as Mr. Smee

admits, the chain of evidence connecting "garget" with diphtheria is incomplete, and as the further investigation of this most important question involves an amount of labour and expense far beyond the means and the opportunities of either individual members of the profession or of our scientific societies, we trust that before long Government will authorise a special inquiry into the subject. In the meantime, Dr. Murchison has done well to appoint a committee to investigate the nature of "garget," as well as the chemical and microscopical characters of the milk secreted by the affected gland.

## THE IRISH COLLEGE OF SURGEONS AND THE DENTAL DIPLOMA COMMITTEE.

It will be recollected that at the last meeting of the General Medical Council a combined and obviously venomous attack was made by a few of the Scotch and London representatives against the Irish College of Surgeons in reference to the dental diploma recently instituted by that body, and respecting the proceedings of an organisation called the Dental Diploma Committee, in connexion with the concourse of candidates for that diploma. It was alleged or insinuated *firstly*, that the College had admitted persons of a doubtful competency to a sham examination, and, *secondly*, that it had "touted" throughout England for candidates with the object of getting their diploma fees. *Thirdly*, that the Dental Diploma Committee, who were alleged to have acted for the College on this occasion, had obtained money to all intents as a bribe for their recommendation of candidates to the College, and that the College had made that recommendation an essential of admission to examination. These statements having been broadly and unexpectedly made in the General Medical Council, the representative of the Irish College found himself unable to refute them. But he earnestly protested his knowledge of the untruth of a part and his disbelief in the whole of the other, promising that his College would inquire as soon as possible, and —if it appeared that there was any justification for the statements,—would no longer accept the recommendation of the Dental Diploma Committee. Accordingly, after the rising of the General Medical Council the Council of the College took immediate action, and, finding on inquiry that the Dental Diploma Committee had been supposed by many to have been directly associated with the College, they resolved no longer to accept the recommendation of that Committee, or of any other organisation, as a whole, though being still ready to receive the recommendation of its individual members, and accordingly an alteration to that effect was made in the ordinance of Council. The members of the Dental Diploma Committee, learning of this action of the Council of the College, and being aware of the accusations made against them in the General Medical Council, felt themselves bound to set themselves right with the College and with their profession, and they therefore wrote to the Council of the College, asking that they might be heard in explanation, and requesting that their diplomas might be retained until those explanations should be heard.

This request the College Council readily complied with, and named a day to receive the Committee, remitting it, meanwhile, to a sub-committee to make all possible inquiries as to the truth of the charges against the committee put forth in the Medical Council. On the appointed day the five gentlemen who are the executive of the Dental Diploma Committee were in attendance, and were heard at great length in answer to the charges and inuendos made against them, and were subsequently, we may say, cross-examined, respecting the facts. They having retired, the Council deliberated for some time, and ultimately resolved—

"That having heard from the Dental Diploma Committee a full statement of the origin, objects, and history of their Committee, this Council feels bound to express their conviction that the gentlemen composing the Dental Diploma Committee were actuated throughout by the sole desire to benefit and elevate their profession, and that their united action in this matter was honourable and disinterested. At the same time the Council regrets that through the wording of certain letters and circulars issued by the Dental Diploma Committee, and through the zeal of some of its members, an unfounded impression was created that reflected injuriously on the character of this College."

This resolution, it will be observed, at once and clearly acquits the Committee of the grave charges made by Mr. Turner, Dr. Storrar, and by the editor of one of our dental contemporaries; and at the same time it justifies the College in the confidence which it placed in the recommendation of the Dental Diploma Committee.

The naked truth of the matter—divested of the misinterpretations and insinuations put upon it by persons who were anxious to injure the Irish College, and still more anxious to "smash" the Committee—was, that certain members of that Committee worked with great energy to make the Irish diploma a numerical success. In doing so they wrote private letters to very many dentists throughout the kingdom whom they believed to enjoy a repute which might entitle them to admission to the College. These letters were quite unofficial, and many of them confidential, and were couched in familiar and persuasive language, and, of course, they used freely the name of the Irish College without in the least implying that they were authorised by that College. Certain of the persons who had received these letters, and who had decided to present themselves for the dental diploma, were found afterwards not to enjoy the highest professional reputation, and being unable to obtain such testimonials to character as would satisfy the College Council, were not admitted to examination. In retaliation upon the College and the Committee, they therefore made public these private letters, which, though perfectly unobjectionable between individuals, would not have been suitable as official or collegiate communications, and they represented them as the *litera scripta* of the College. Certain Scotch members of the General Medical Council, who were jealous because the Irish College had taken the lead of Glasgow and Edinburgh in the initiation of a diploma, and certain London members and editors who were equally irate because the Irish College received dentists whom they considered the legitimate spoil of the London College, were happy in the opportunity to attack the College, and will, no doubt follow up that attack, although it has now been shown that there was no ground for it. The modicum of truth which it contained was that the terms in which the letters of the Dental Diploma Committee were couched were not

always discreet or dignified. All the rest, the charges of dishonesty, of black-mailing, and of disreputable touting on the part of the College, were utterly untrue and unjustified by any evidence.

## THE SANITATION OF DUBLIN.

We are glad to state that the proposal of the Public Health Committee of the Corporation, to superannuate the superintendent medical officer, and give his duties to the medical officer of health, has not outlived public opinion. The Local Government Board has vetoed the proposition in a communication which says :—

It will be seen that the order of the L. G. B. required the appointment of two separate officers, and as at present informed the Local Government Board are not enabled to approve the proposed amalgamation of officers, nor consequently to rescind the orders.

In reference to this, the following resolution was adopted by the Public Health Committee, viz :—

The recommendation to the Local Government Board of a change such as that contemplated, could only be made so far as the Dublin sanitary authority is concerned by the Municipal Council, and not by this or any other committee. The committee, therefore, regret that the Local Government Board should have come to a decision on the subject before the sanitary authority had an opportunity of considering whether it would recommend it or not. Had the board awaited the discussion of the subject by the sanitary authority, they might have been more fully informed as to the reasons which caused, and still cause, the committee to think that the proposed change, if effected, would be a most beneficial one. The committee regret that they cannot but consider the premature decision of the board upon a matter of such public importance, a decision which, in the opinion of the committee, will retard sanitary improvement in Dublin.

The committee is evidently chagrined at the miscarriage of its proposal, but it can find no better reply to the Local Government Board than the complaint that that department did not wait for discussion in the Town Council. In our opinion the Irish Local Government Board acted with perfect propriety in stopping a discussion in favour of an illegality. It would have been just to complain, had they done so, that they allowed the Corporation to waste its time upon a subject over which that body had no control.

We do not propose to revert to the subject of the proposed amalgamation of offices, but as to the general question of Dublin sanitation we cannot refrain from quoting, in corroboration of our views, a pen-portrait of the dwellings of the poor in Dublin, clipped from the *Irish Times* (which journal paradoxically supported the proposed job). Our contemporary says:—

We cannot over-estimate the fatal results accruing from ignorance, indolence, and neglect. Those who have taken the trouble of making a tour or inspection in the districts to which we refer, cannot soon forget the misery, wretchedness, squalor, and filth to be met with on every hand. Enter one of these houses let in tenements. It is not alone that some of the precautions indicated by sanitary science are omitted, that some of the conditions suggested by the ordinary principles of cleanliness are neglected, but *all* precautions and observances are overlooked, and their opposites obtain. There are no offices, no suitable ash heaps, no ventilation, no pure air. Water is the one thing fresh and pure amidst hideous surroundings of everything that is foul and impure. Fetid moisture reeks from the clammy walls, slime makes slippery the stairs and the floors. In the rooms, the windows are closed so tightly that no breath of air can enter. Where the glass has been broken, the aperture is filled up. This in cold weather, is possibly intelligible, for fuel is scarce and dear. Then the room is overcrowded, a whole family living there, if the word living may be applied to such an existence. From cellar to attic it is the same—dirt and stench, unspeakable and indescribable. There are tumble-down buildings impregnated with filth, yards that would sicken a strong man to see if he were unprepared for such sights, dull, helpless, apathy characterising the dwellers in these pest houses. And the human beings—they show in the sallow cheek, lustreless eye, heavy movements, and stolid demeanour the hopeless misery which is their lot, to which they themselves so greatly contribute. If, as the homely adage says, "cleanliness is next to godliness," it may almost be affirmed that its opposite leads quite the other way. Need we wonder that these wretched people get drunk and mad when they emerge from their abominable dens, which they have no great objection to change for the prison? Need we wonder that the mind is debased by the very associations? The women—almost unsexed—are haggard, hollow-eyed, ragged. The children are neglected—thin, scrofulous, decrepid. "Can such things be," asks some humane person, to whom, possibly enough, the above may seem exaggeration. Inquire, sir or madame, of any clergyman—Roman Catholic priest for choice—inquire of any dispensary doctor, and if they do not fear to shock your ears they will tell you things far more appalling than that which we have set down above, and we speak of what we have seen with our eyes

We believe we are correct in stating that, upon the renting of these tenements, wealthy people in Dublin make profits of from 10 to 25 per cent. on their investments. All this could be changed at an insignificant expenditure, if the Public Health Committee pleased. The law is ample, all costs are payable by the defendant on conviction, the thing might be done in three months if the Public Health Committee chose to speak the word. But it does not choose. It will harry the squalid inhabitants of these dens, but it will not move a finger against the landlords. Why? it is for the Committee to say. If they attempt an excuse, let them not talk of expense, for none is needed for the discharge of this part (and the most necessary part) of their duty.

## ANTI-REFORM IN MEDICAL MATTERS.

It is very desirable that, in the consideration of all great political questions all parties, even those numerically insignificant, should have some journalistic representative; and generally speaking, it is so, for the moment that a party, no matter what its principles may be, becomes sufficiently strong, either in mouey or in numbers, to afford a newspaper, it has one. The Anti-Vivisectors, the Anti-Contagious Disease advocates, the Anti-Vaccinators, and even the Tichbornites, have each their own journal, and the intelligent (?) members of those parties can thus readily interchange their opinions and the mental aberrations which they please themselves by calling arguments. But it cannot be so, as a rule, in medical politics, because the profession is neither so numerous, so rich, nor so literary in appetite as to enable minorities to secure journalistic representation of their views.

We must, therefore, presume that the section of the profession which believes in the General Medical Council is gaining either in numbers or in influence when we find the *Medical Times and Gazette* taking up their cause, and

"going in" as the champion of the existing Council against the somewhat numerous and united host of enemies whose complaints have been expressed by all other medical journals including ourselves. In an article on "The Promised Medical Bill" in our contemporary's last issue it is stated that, "beyond (conjoint examination) there lie only two really important points of reform to be secured—*first*, the registration of colonial and foreign degrees and qualifications; and, *secondly*, the rectification of the penal clauses." We feel that gallantry compels us to remonstrate with the *Medical Times* for forgetting the women, who are certainly "important points" in every sense of the words, for it was they who (if we may use so inapplicable a term) "furthered" Lord Ripon's amendment of last year, and who stopped the further progress of the Bill, and ignominiously defeated the Government and the medical reformers.

The *Medical Times* goes on to say "we wish heartily that, with these few remarks we could dismiss our anticipation of the new medical bill. . . . . If Conjoint examination were accomplished we might be able to afford the time and trouble of looking at certain collateral questions which, growing out of little more than sentiment have been written and talked about, and kept before the profession and Parliament by means of petitions and deputations until they have come to assume an aspect of serious importance, and have positively been sufficient to obstruct all useful reform. Foremost amongst these "fads" is what is called direct representation—otherwise the reconstruction of the Medical Council. We do not believe that the feeling respecting direct representation which has been incessantly reported as strong and genuine, exists to any very important extent among the independent portion of the profession."

As soon as we hear from our contemporary whom it designates the *independent* portion of the profession we shall know how much truth there is in the assertion. If it means the metropolitan big-wigs we can readily understand the remark, for we know by experience that as a rule the wealthy, take-it-easy, luxurious aristocracy of medicine have little knowledge of, and less sympathy with, the wants or feelings of the "helots" who practice in the lower grades of medical practice, and, moreover, are essentially ultra-conservative of abuses, and averse from change of any sort. But, if any considerable number of the profession be classed as "independent," we assert that the statement of the *Medical Times* is discordant with fact. True, the majority of medical men are undecided as to what "direct representation" may mean, and very many have their own idea that something more than the election of six general practitioners to seats on the Medical Council is needed. But we nevertheless assert that not less than three-fourths of the medical men throughout the United Kingdom are strongly of opinion that the General Medical Council has proved itself constitutionally inefficient, and must be reformed before any really honest effort to amend medical affairs will be made. We may add that those who concur in opinion with the *Medical Times* number but few more than the members themselves of the Medical Council, and those who have thriven upon the abuses which that Council has showed itself incompetent to remedy.

# Notes on Current Topics.

## The Contagious Diseases Acts.

We have been favoured by Dr. Nevins, of Liverpool, with a copy of the *Shield*, containing a memorial promulgated by a number of persons in Portsmouth as a sort of counterblast to the facts in favour of these Acts, quoted by the Rev. Mr. Grant, in our issue of Nov. 20, 1878. Dr. Nevins challenges us to publish the memorial, which, for the sake of fairness, we would readily do if it threw the least light upon the subject, either for or against the Acts. But it does not. The memorialists quote the statistics given by Mr. Grant, and "desire to express their entire disbelief in those figures," and for a strange reason—not because they can show any evidence to the contrary, nor because the figures are incredible of themselves, but because Mr. Grant's "are the identical figures that have been supplied to the authorities in London by the officials, surgeons, and police who have administered the Acts in this district." It is, we presume, expected by the memorialists that we are to discredit Mr. Grant's figures because they are corroborated by the authorities. The memorialists, as we have said, "entirely disbelieve" these facts, and "declare their firm conviction that the aforesaid figures are grossly inaccurate and misleading." The only facts they can quote *per contra* are—1. That the decrease in the number of brothels cannot be due to the Contagious Diseases Acts, because those Acts give no power to the police who work the Acts to close them. But the operation of the Acts may have a very important indirect effect by calling to the brothels the attention of those who have the power, and who, no doubt, work in accord with the police who work the Acts. 2. That the apparent enormous diminution of disease (from 70·56 in '65 to 4·84 in '76) is due to the fact that the present Acts give power to examine all prostitutes, whether diseased or not, while the former law gave power only over the diseased. There is, we admit, considerable force in this statement, if it be true.

The rest of the memorial consists of protestations upon the religious and constitutional principles involved in the Contagious Diseases Acts, with which we have nothing to do, and with very little of which we concur. The signatories to the memorial, we find, consist of 2 clergymen of the Church of England, 17 nonconformist ministers, 28 artisans and shopkeers, 1 town councillor, 1 engineer, and *one* surgeon—all most excellent, well-intentioned people, no doubt, but what do they know about the propagation of syphilis? Are they unprejudiced witnesses? Where are the facts on which they depend to counterbalance the figures already before the public? We have had enough of protestations and denunciations in italics and small capitals. Might not the opponents of the Acts vary the monotony of their argument with a little proof!

## Sanitary State of the Russian Army during the late War.

The statistics that are furnished by certain official documents show in a remarkable manner that the health of the army rapidly improved after the wounded returned home. The number of sick, which on the 18th of June was as high as 49,080, fell on the

14th of July to 29,047, so that in the course of twenty-six days there was a diminution of the sick to the extent of 20,033, while 12,054 of this number were sent back to Russia. A large number of troops were conveyed by sea to Odessa, Nicolaïeff, Sebastopol, and Theodosia. From the beginning of May to the 17th of July 36,000 sick troops were sent home, and of this number there were only 41 deaths during the transport. It was in April that the most sickness prevailed, typhus and intermittent fever being most common; while cases of bronchitis, pneumonia, dysentery, scurvy, &c., were also observed.

## Festivities at St. Mary's Hospital, Paddington.

St. Mary's has been unusually well decorated this year, owing to the combined efforts of the matron (Miss Williams) and her nursing staff, house surgeons, lady visitors, and students. The effect is charming, especially in the Accident Ward, where cotton wool has been used to imitate snow in a very seasonable manner. A Christmas-tree entertainment was held in the board-room, at which all patients capable of leaving the wards were present. A magnificent tree, over twenty feet high, laden with three hundred presents, was much appreciated. In order that all the patients should participate in the festivities, Father Christmas (impersonated by Mr. Wills) marched through the wards, accompanied by a juvenile troupe draped in scarlet, and carrying a huge snowball from which presents were distributed to all. After the distribution of presents the "St. Mary's Lily Minstrels," under the management of Mr. Byres, assisted by an amateur band, gave a serio-comic entertainment, the part of "Bones," which was taken with great spirit by Mr. Hayes, causing constant merriment. The whole performance gave great satisfaction, not only to the patients, but also to a large gathering of ladies and gentlemen who had been invited. A vote of thanks to the matron (Miss Williams) and the gentlemen who had so kindly assisted concluded the entertainment.

## Mortality in Marylebone.

In illustration of the effect which, as we recently remarked, very cold weather has upon the death-rate, it appears from the last monthly report issued by Dr. Whitmore, the medical officer of health for Marylebone, that the death-rate for the four weeks ending December 28 was as much as 30·20 per 1,000 of the population, 8·0 per 1,000 in excess of the average death-rate of 1877, and nearly 7·0 per 1,000 above the average of the last 15 years. Amongst the deaths was that of a widow, who died at the Home for Aged Poor, aged 103 years. Owing to the life-destroying effects of the cold bronchitis was fatal in 99 cases out of 370 from all causes, and 60 of which were in persons above the age of 50. It is also stated that at least 75 per cent. of those who fell victims to the cold weather belonged to the indigent classes, a large proportion of whom might have been saved had they been properly cared for. Therefore, Dr. Whitmore thinks that some more prompt, direct, and efficacious method of saving human life in seasons of severe frost than is at present adopted becomes an imperative duty, alike incumbent upon the parochial authorities as on the wealthy and benevolent. Had some well-devised system been in operation during the past five or six weeks of searching out the infirm and destitute in their wretched abodes, and supplying them temporarily with food, fuel, and warm clothing, the death-rate from diseases of the breathing organs would undoubtedly have been infinitely less. The births for the quarter were 1,311, and the deaths 955, the latter being equal to 24·03 per 1,000 of the population, or 3·66 per 1,000 in excess of the previous quarter.

## Le Dr. Tardieu.

With much regret we have to announce the death of Dr. Tardieu, than whom, probably, few members of the profession are better known throughout the civilised world. Not a few remarkable works on pathological and clinical medicine has the world to thank this great mind for, the latest of which has just reached us, bearing the date 1879, entitled "Etude Medico-Legal sur les Blessures." Tardieu was, perhaps, best known in this country for his "Dictionnaire Hygiéne Publique," and also for his celebrated *brochure* "Etudes Medico-Legal sur les Attentats aux Mœurs," which in a short space of time has been through seven editions, and is, so far as we are aware, the only scientific treatise ever written on this repulsive subject. But a great genius may undertake that which would be almost ruin to one of an inferior grade, and so it happened that whatever Tardieu undertook, it was with such a masterly hand, that love of science for science sake and the benefit of humanity was seen in all his writings, and he will be mourned as an almost irreparable loss wherever his influence was felt or his works known; and the Faculté de Médècine of Paris has lost by his death one of its brightest ornaments.

## Liability of Hospital Surgeons to give Evidence at Coroners' Inquests.

On the 16th inst. an inquest was held at the Radcliffe Infirmary, Oxford, to which Mr. Horatio Symonds, surgeon of the infirmary, who had attended the deceased, was summoned by written summons. He, however, did not appear, and the inquest was accordingly adjourned until the 16th inst., when he was brought up in custody on the coroner's warrant, and gave the necessary evidence. It is further alleged that a short time since another medical officer of the town refused to appear to give evidence at an inquest, although formally summoned by the summoning officer.

If we understand correctly the motives of Mr. Symonds and his co-recusant, it seems to us that these gentlemen deserve the thanks of the profession for having entered a formal protest against the most unjust and somewhat impracticable law which compels an hospital surgeon to testify before a coroner's jury without fee or reward. By the Coroners (Ireland) Act, Sec. 32, it is provided that "when any inquest shall be holden on the body of any person who has died in any public hospital or infirmary, or any building or place belonging thereto, or used for the reception of patients thereof, or who has died in any county or other lunatic asylum, or in any public infirmary or other public medical institution, whether the same be

supported by endowments or by voluntary subscriptions, then and in such case nothing herein contained shall be construed to entitle the medical officer whose duty it may have been to attend the diseased person as a medical officer of such institution as aforesaid to the fees or remuneration herein provided."

This section has been long felt to be very unjust to hospital surgeons and physicians, and in Dublin it has been systematically evaded. The hospital surgeon usually occupies a high professional position, and is in full swing of practice, and it has not been found practicable or fair to recognise his attendance at hospital inquests. Therefore, uniformly, the evidence of the resident medical officer is taken, and consequently, inasmuch as many of the Dublin hospitals are not officered by a qualified medical man but by a student, we have very frequently the coroner's witness box occupied by a witness who possesses no medical qualification whatever, and is forbidden by the Medical Act to testify on medical questions. He is not, either as a matter of fact or in law, "the medical officer whose duty it may have been to attend the deceased person," and it is, therefore, contrary to law to receive his evidence, and any verdict arrived at thereupon might, no doubt, be upset on appeal.

In institutions which are maintained by the State there might be some ground for requiring medical officers to give expert evidence at inquests if that were set down as part of their salaried duty, but in privately supported institutions the case is different. The State has no equitable claim whatever, in such cases, upon the time or the skill of medical men, nor is the duty one which a professional man could be expected to perform gratuitously for the benefit of the community. Moreover, in very many instances the law works to the public prejudice, for usually in every case of accident or sudden death in the street, the patient is taken at once to the hospital, and though he may be dead long before he is so brought, yet he must be retained there. Thus in a multitude of cases in which his medical attendance can be of no avail, the hospital surgeon may be called from his other avocations, and he is, furthermore, refused a fee for his testimony when the cause of death comes to be investigated.

## Gratuitous Attendance on Gentlemen's Servants.

We have been frequently interrogated as to the liability of Poor-law Medical Officers in Ireland to attend upon the servants of the neighbouring gentry upon the usual "tickets." As a general rule, the doctor who is retained by the family attends the servants without fee; but there are numerous instances in which the masters and mistresses have their own pet doctor, and, when needed, send for the dispensary doctor for the servants. Attendance in this way is especially irksome, and the more so because the upper servants of first-class country gentry are usually not only "in clover" as regards present wants, but also comfortably provided with money laid by; and are, moreover, not likely to trouble themselves to conceal their contempt for the doctor, who is obliged to attend them for nothing, and is not allowed to prescribe for the master or the young ladies.

As to the doctor's position under the circumstances, we may say that there is no law to make masters liable for their servants' health; and, therefore, if the doctor be sent for by the servant he must look to him or her for payment. But if the master sends for him—without a medical relief ticket—then he at once becomes liable under contract with the doctor. If a "red ticket" is served upon the doctor he must attend, under all circumstances, for the law does not put any limit to the granting of tickets, saving that the recipient must be "poor" in the opinion of the person who issues the ticket. There is no doubt, however, that upper servants are not, in most instances, fit persons to receive a ticket, nor are they "poor" on any fair interpretation of the word. Indeed, the Irish Local Government Board has said so in a communication to a Medical Officer some years ago Their letter runs :—

"On the one hand, it would be an abuse to call upon the Medical Officer to attend domestic servants in the families of well-to-do people. On the other hand, it is impossible to say that in no case of a domestic servant the granting of a dispensary or visiting ticket would be justifiable."

In this pronouncement we perfectly agree. The Poor-law Medical Officer is, in fact, in the power of the ticket issuer, and at the disposal of his sense of fairness.

## Instructions to Medical Officers under the New Public Health (Ireland) Act.

Nearly six months have now elapsed since the new Act became law, and the medical officers who are engaged in administering it are not up to the present time officially informed as to the changes in the law which that Act involved. The Irish Local Government Board has issued a couple of circulars to the Boards of Guardians throughout Ireland, but have not instructed the medical officers on the subject, and, except for what they have learned through the Medical Press, those officers are in complete ignorance of the altered law so far as it affects either their duties, responsibilities, or emoluments. The Local Government Board has stated to one medical officer that they do not propose any change in their General Order, which defines the duties of their officers (a determination from which we very emphatically dissent, inasmuch as that order is in some respects at variance with the law), but they have not said a word as to the change of title, additional authority, and special fees for sanitary prosecutions, for burial certificates, and for ship visiting provided by the new Act. Are we in too great a hurry about it? Possibly the Local Government Board considers six months a reasonable time to incubate a circular.

## Salicylic Acid in Beer.

M. Blas, corresponding member of the Belgian Academy of Medicine, has in *La Presse Médicale* called attention to this subject. Four years ago, he says, Prof. Kolbe, of Leipzig, was the first to notice the anti-putrescent and anti-fermenting properties of this acid, and at the same time indicated the possible applications of this new agent. It is now generally acknowledged that when this acid is added to beer in the proportion of from one to two decigrammes to the litre, or 10 to 20 grammes to

the hectolitre, the beer is preserved from secondary and injurious fermentation. Without either the taste or the appearance, or the slow alcoholic fermentation of beer being at all modified, the action of secondary ferment is paralysed, and it is only in larger quantities than that above-mentioned that the acid has any destructive effect upon the ordinary constituents of beer. It occurred, therefore, to M. Blas to inquire whether this acid was used by brewers for the purpose of adulterating their beers, and the result of his investigations showed that this acid was used by them on a large scale, approximating in the proportion of 5 to 10 grammes per hectolitre. He found, however, by several experiments, detailed in his paper, that this quantity of salicylic acid in beer did not exercise any injurious influence upon the health. Other observers are of the same opinion, but further experience is acknowledged to be necessary before beer thus adulterated can be said to be absolutely harmless.

## The Combination of the Cinchona Alkaloids with Opium.

Several recent writers have urged the value of this combination. It is one perfectly familiar to Southern and Western physicians. Dr. P. G. Skillern claims that—

1. By a combination of the cinchona alkaloids with opium a much better effect is obtained; a paroxysm being aborted with much more certainty, and a much earlier and more complete cure ensured.

2. Only half the amount of quinia or cinchona is required.

3. It relieves any painful sensations which might be associated with periodic affections.

4. Exemption from certain disagreeable effects upon the brain, headache, tinnitus aurium, &c.

5. It enables the stomach to retain quinia much more readily.

6. Large and continuous doses of quinia or cinchona may be given without producing cinchonism, if combined with morphia.

---

As one of the effects of the recent legal proceedings in reference to the Hampstead Small-pox Hospital a communication was received on Saturday by the Metropolitan Asylums Board from the solicitors of an owner of property in the vicinity of the Stockwell Small-pox and Fever Hospitals, who, although they have been erected some nine or ten years, has just discovered that the value of the property on his estate has been "greatly lessened" thereby, and wishing to know "if the managers are disposed to make him a fair and proper compensation for the injury they have done him."

---

In the principal foreign cities, the rates of mortality, according to the most recent official weekly returns were, in Calcutta, 57; Bombay, 28; Madras, 44; Paris, 25; Geneva, 27; Brussels, 31; Amsterdam, 26, Rotterdam, 25; The Hague, 27; Copenhagen, 19; St. Petersburgh, 46; Berlin, 25; Hamburg, 27; Dresden, 26; Breslau, 32; Munich, 32; Vienna, 27; Buda-Pesth, 34; Turin, 32; Venice, 33; Alexandria, 48; New York, 23 per 1,000 of the population.

---

The Registrar-General estimates that the population of the 23 principal cities and towns of the United Kingdom on the 1st of January, 1879, was 9,416,068 souls; the returns of mortality will be based upon this calculation.

---

The population of London and its suburbs amounts now to 4,534,040 persons, showing an increase of 84,025 during 1878. To what proportions this modern Babylon will eventually expand it is difficult to conjecture.

---

Sir Wm. Jenner, Bart., Physician to Her Majesty the Queen, has resigned his Professorship of Morbid Anatomy at University College and Hospital, which he has held since 1849.

# Scotland.

Weather and Death-rate.—During the past four weeks severe weather, which still continues, has been experienced in Glasgow, and over the west and north coast in general. Heavy falls of snow continue to occur at short intervals, and frost has been almost uninterrupted. It has been estimated that in Glasgow alone as much as 782,000 tons of snow fell from the 12th to the 18th of December. There has been a preponderance of deaths from pulmonary affections, as may be anticipated; while, though the temperature was much lower during the past four weeks than during the four weeks ending 2nd Jan., 1875, the death-rate has, notwithstanding, been lower. This is contrary to past experience here. The average death-rate for the last four weeks in 1874-75 was 66, and that of the four weeks just passed, 32⅞. During the past week the Glasgow death-rate has been only 29.

Epidemic of Scarlet-Fever at Lesmahagow.—The outbreak of this fatal zymotic at Lesmahagow has evidently run its course. Seventy cases existed, and at least twenty-six deaths took place within a period of less than two months. Since the 4th December no new cases have appeared; and the village schools are now re-opened. During a considerable period milk from an infected house was distributed in Glasgow. The matter was accidentally discovered by the Glasgow contractor, and the supply at once stopped.

The Incidence of Mortality in Gourock.—Out of the 93 deaths in Gourock last year 18 were at the time of death over 70 years of age, and 15 between 60 and 70.

Edinburgh Royal Infirmary.—The annual meeting of the contributors to the Edinburgh Royal Infirmary was held in the Queen Street Hall, Edinburgh, this week; Lord Provost Boyd presided. The annual report of the Managers for the year ending 1st October, 1878, was read, and stated that the ordinary income was £19,570 and the expenditure £25,129, showing an excess of expenditure over income of £5,559. Deducting this sum of £5,559 from the legacies, &c., received, amounting to £13,533, there remained to be added to the capital for the year £7,974. The total amount of stock and funds at the audit of the Infirmary at 1st October was £126,061. The total amount subscribed to the building fund up to 1st October £236,994, while the expenditure amounted to £242,446, showing a deficiency of £5,331. There had been 5,186 patients admitted into the Infirmary between 1st October, 1877, and 1st October, 1878, while between 10,000 and 12,000 attended the out-patients'

department. The average daily number of patients for the year was 460, an increase of 6 on the previous year; the greatest number on any one day was 497, and the lowest number 374. The average time during which each patient remained was 30·1 days. The number of deaths which took place within 48 hours of admission was 98. The percentage of deaths to the whole cases treated was 80. The number of patients received into the convalescent home during the year was 660, being 46 more than during the preceding year. Messrs. John Weir, James Haldane, Christopher Douglas, Robert Besson, William I. Ford, and Dr. H. D. Littlejohn were re-elected managers.

Andersonian School of Medicine.—A movement was inaugurated recently, chiefly among the medical staff, with a view to the removal of the entire school to a neighbourhood contiguous to the University. At a meeting of managers held a week ago, that project was, for the time, at least, shelved. It is generally feared that any such action on the part of the managers would not further the ends for which the school was originally founded; the medical staff, on the other hand, think that, by proximity to the larger teaching corporation a healthier rivalry would be called into action, and that their chances would be thus bettered. Distance cannot be of much moment in such a city as Glasgow, the present site is close to the Royal Infirmary—one of the largest institutions of its kind in the kingdom—and it seems hardly complimentary to the teachers themselves to urge the importance of locality in such a matter. It is perfectly obvious that the class of students which crowded at one time the ranks of such schools as the Andersonian and its rival school in connection with the Infirmary is fast diminishing, and that this will eventuate in benefit to the profession there is no reasonable doubt.

Edinburgh University.—The matriculation returns for the past year have just been made up. The aggregate number of students on the register in residence for 1877 was 2,560; for 1878 they amount to 2,617. These were divided among the different faculties as follows: In the Faculty of Arts there were 885 students; in the Faculty of Divinity, 71; and in the Faculty of Medicine, 1,293. It is supposed that the increasing ratio in the latter faculty is due to the wide range of supply of students to which India, our colonies, and even foreign countries, contribute. From the register it is shown that of the 1,293 medical students 565 are from Scotland, 445 from England, 22 from Ireland, 75 from India, 149 from different British colonies, and 34 from foreign countries. The average age of students in the Faculty of Arts is 20-6 years; in the Faculty of Divinity, 23-5; in the Faculty of Law, 22-3; and in the Faculty of Medicine, 20-8 years. During 1878, 30 took the degree of M.D., and 115 the double degree of M.B. and C.M. During the same period additions have been made to the list of university prizes, bursaries, &c. 1. "The Cameron Prize," a sum of £2,000 has been left by the late Andrew Robertson Cameron, M.D., of Richmond, New South Wales, for the purpose of establishing a prize to be given at the graduation ceremonial in August in each and every year to the practitioner or member of the medical profession who shall be adjudged to have made the most valuable addition to practical therapeutics during the preceding year, the word "therapeutics" to be taken in the widest sense as including every agent or agency capable of influencing the human body in the maintenance or improvement of health, the avoidance or cure of disease, or the alleviation of suffering. 2. "Dr. John Aitken Carlylis Bursaries," two bursaries of the value of £30 each to be awarded by competitive examination. One is open annually to students in the first year of their medical course for proficiency in anatomy and physiology. 3. Two "MacKenzie Bursaries," of the annual value of about £25 each, have been founded in memory of the late William MacKenzie, F.R.C.S.E., formerly Demonstrator of Anatomy, and Curator of the Anatomical Museum in the University. They are open to students in each of the junior and senior anatomy classes respectively, and will be awarded at the end of the session to the student who has displayed the greatest industry and skill in his practical anatomy work.

Glasgow Western Infirmary Samaritan Society.—A meeting of this Society was held in the Religious Institution Rooms last week. The Society has existed for four years, and seems to be instrumental in relieving much distress and want otherwise. Since the 1st December last 440 received relief. Convalescents to Dunoon, number 40; Lenlie, 191; Kilmun, 42; Saltcoats, 13. Surgical appliances, artificial limbs, crutches. blankets, chemises, petticoats, &c., have been largely given to needy applicants.

Death of a Centenarian in Orkney.—Jane Ballantyne, an unmarried woman, has died in Orphir, Orkney, aged 102 years. She was a pauper, and lived in her native parish the whole of her life.

Glasgow Medico-Chirurgical Society.—A meeting of this Society was held in the Faculty Hall on Friday the 10th inst. There was a large attendance. Dr. Joseph Coats read a paper on "Descending Sclerosis of the Spinal Cord," exhibiting microscopic specimens. Drs. Gairdner, MacCall Anderson, Foulis, and Mr. John Reid, took part in the discussion. Mr. Reid deprecated with much force the meanderings of minute microscopic examinations in their bearings on practical medicine.

# Literature.

## DIPHTHERIA, ITS NATURE AND TREATMENT, VARIETIES, AND LOCAL EXPRESSION (a)

The views on the subject of diphtheria have within the past few years been so modified that it becomes a matter of considerable importance for the practitioner to have a concise epitome of the etiology, pathology, symptoms, and treatment of this disease ready to hand to consult in a case of emergency. The work now published by Dr. Mackenzie fulfils this object, and the treatise is specially valuable as coming from the pen of one who has himself had vast experience of this disease, and whose accurate acquaintance with all forms of throat affections enables him to speak with confidence and authority.

There is embraced in this book of about 100 pages, everything of interest and importance to the physician. The views in reference to the origin of the disease from bacteria, more especially those of Oertel, Hueter, Nassiloff, Letzerich, &c., are all touched upon in the chapters on the pathology, etiology, and proof of inoculation with the diphtheritic exudation; the various complications, glandular, respiratory, cardiac, splenic, hepatic, and renal, are fully entered into. So are several questions discussed which have lately arisen as to the septicæmic condition induced by the diphtheritic poison, and the mode of propagation of the latter, more especially its relation to ordinary catarrhal states of the throat, &c. The chapter on the history of the disease is replete with interest, and in it is given a historical sketch of the affection from the time of Pythagoras, tracing the descriptions of it as they have appeared in Sanskrit, Latin,

(a) "Diphtheria, its Nature and Treatment, Varieties, and Local Expression." By Morell Mackenzie, M.D., London, Senior Physician to the Hospital for Diseases of the Throat and Chest; Lecturer on Diseases of the Throat at the London Hospital Medical College, &c. Pp. 104. London: J. and A. Churchill. 1879.

Dutch, Spanish, Italian, French, American, and British writings.

As in the case of scarlatina, the spontaneous origin of diphtheria is at all times a theme for curious speculation when it occurs in localities the most isolated and the healthiest.

"A very remarkable instance of the apparently spontaneous origin of the disease was observed last year by Dr. Semon, at a small health resort called 'Bad Fusch,' in the Tyrol. This place, consisting of only two houses, is situated at an elevation of from 3,000 to 4,000 feet above the sea, and is celebrated for its fresh air and pure water. In one of these houses a little girl, five years of age, who had left Vienna five weeks previously, was suddenly attacked with diphtheria, which was subsequently followed by paralysis. The visitors consisted almost entirely of tourists, ascending the high mountains in the neighbourhood. Although other children had been playing with the little girl up to the day on which she was attacked, no other case of the kind occurred."

"Dr. Thursfield found in certain isolated hamlets and houses where in recent years he had been called upon to investigate cases of diphtheria, that at intervals of five, ten, fifteen, twenty-five, thirty, and even more, years, there had been previous outbreaks of fatal sore throat. An instance is recorded by Dr. William Squire in which the virus remained latent eleven months, and then led to the development of the disease when a person occupied the room in which a case of diphtheria had previously occurred. I have known the poison to remain dormant for four, seven, and fifteen months, and in one instance for three years, and then again to become active. From the above considerations the vitality of the diseased germs would seem to be considerable."

The various channels through which the poison enters the system are minutely discussed, (*a*) direct implantation, (*b*) the circumambient air, (*c*) the water drunk, or the food that is eaten; the cause of an epidemic having been lately traced to milk infection is a proof of the last.

Dr. Mackenzie places the average period of incubation from two to three days; though this period is by no means the rule, as the poison appears to take a much longer time to develop in a large number of cases from the time of exposure to contagion. Age is apparently one of the strongest of predisposing causes. Of 1,000 cases 540 occurred before the age of five years, and 800 before the age of ten years.

The chapters on the symptoms, paralyses, and diagnosis, are replete with valuable hints, and especially we would direct attention to the description of "mild or catarrhal diphtheria," which, if carefully studied, would save many a fatal blunder. Not seldom has the evidence of the diphtheritic taint been overlooked until some poisonous symptoms are developed, or a lingering paralysis supervenes, the attention being then for the first time aroused to the true nature of the ailment. The practitioner is taught the safe rule in all suspicious cases, to examine carefully the pharynx, and to test the urine for albumen. A point of vital interest is the occurrence in diphtheria of endocarditis, and frequently accompanying leucocytosis; the consequent thrombosis, it may be, in an obscure case diverting attention from the original evil. But unquestionably the most valuable portion of the book is that devoted to the subject of treatment and the consideration of laryngo-tracheal diphtheria or croup. The belief in the affinity of croup and diphtheria, and indeed their identity, both clinically and pathologically, though differing anatomically, is more and more gaining ground. Dr. Mackenzie is a strong advocate of this view. Many useful and novel suggestions, for the management both of the pharyngeal and laryngeal affections, are to be found in the chapter on the treatment of the disease. We think the weak part of the book is discoverable in the paucity of the remarks bearing on the medical treatment of croup, and the want of more explicit instruction, which the author's enlarged personal experience would have made doubly valuable, regarding the operation of tracheotomy. Nor do we find that reference to his own experience of the results of the operation which we might have anticipated. In this we were disappointed. Sufficient evidence, however, is adduced by a mass of reliable statistics to show the necessity for the operation.

There are two short chapters at the end of the work on nasal diphtheria and secondary diphtheria, or diphtheria complicating other diseased states, particularly the exanthemata. It would appear from the table of Sanné that of 229 cases 137 occurred in measles, 95 during scarlatina, 20 during whooping-cough. We have read this little work through with interest and profit. It is just the type of work required for the hand of the general practitioner. It is written in a clear and explicit style. It contains a fund of valuable hints. We welcome its advent as the latest and best contribution to British literature on the subject of diphtheria.

# Correspondence.

## UNQUALIFIED PRACTICE—THE APOTHECARIES' SOCIETY, THE PROFESSION, AND THE PUBLIC.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Mr. Upton, the solicitor and clerk to the Society of Apothecaries has addressed a letter to you which appeared in your issue of January 1st, purporting to enclose a statement in reference to the cost of the Apothecaries' Society *v.* Shepperley. The publication of the following, in reply, will not, we venture to think, be uninteresting to your readers.

After the action referred to had been brought and concluded, we discover the Society in the act of "*attempting to show*" that it had reasonable grounds to authorise the prosecution of Mr. Shepperley; that the trial was, to a certain extent, compelled by the observations of the two judges (Kelly and Cleasby), who ordered the cause to be removed by *certiorari* to the Superior Court; and that the case, as tried by Mr. Baron Pollock, dealt merely with the evidence, and involved no important decision on the law one way or the other. Why the Society should attempt to show these facts, which were abundantly manifest, is difficult to understand. Here we find an august and deliberative body—the Master Wardens and Society of Apothecaries—intrusted with the administration of a penal act, attempting to show that it had reasonable grounds for sanctioning proceedings under that act when such proceedings had been taken out and had failed.

But the point to which we particularly wish to draw attention is Mr. Upton's statement, that the position of the Society in reference to prosecutions is one of difficulty—on the contrary, it is remarkably easy. Since we have been connected with the prosecution—as solicitors for the Medical Defence and the Medical Alliance Associations—the practice has been this: the Associations have received complaints from all over the country of unqualified practice, some of a most serious character. These complaints have been investigated at an amount of trouble and expense that outsiders know nothing of. An *epitome* of the evidence has been forwarded to the Society, which has then given a printed consent, containing the following paragraph:—"*The Society must be relieved from all expenses attending the proceedings, and they can only be commenced on that understanding.*" The actions have then been initiated, the *entire* expenses defrayed by our clients; and within the short space of two years and a half, sixteen judgments in favour of the Apothecaries' Society have been the result. Most of these cases were tried in the Superior Court.

This is a brief outline of the "difficult position" to which Mr. Upton refers, from one point of view. We now ask the attention of your readers to it from another—the broad and moral aspect. Why should the position of the Society be difficult in the matter of prosecutions, supposing that it desires with honesty to administer the Act with which it is entrusted? The acting and practising as an apothecary has been clearly defined by some of the best and most learned judges—notably, by Creswell, in the case of the Apothecaries' Company *v.* Lotinga. The Society and its legal adviser have only to apply the test of the definition contained in Mr. Justice Cresswell's judgment, and if the evidence is sufficient to satisfy that test, we maintain that their duty is clear, they have no discretion, and a consent to prosecute under the penal clauses of the Act *must* be granted.

A word about the two pending cases to which Mr. Upton refers, in which the Society has received an intimation—on behalf of several of its licentiates—that a mandamus will be applied, requiring them to prosecute or to allow our clients to do so. In speaking of these, we are, of course, under a certain restraint. That they are gross cases is conceded even by Mr. Upton and the Society itself. The one is the case of a man totally unqualified, in large and active practice in Wales; the other, of a person practising in virtue of the

degree of "Doctor of Medicine of the Metropolitan College of New York," in a metropolitan district. In the latter case, copies of certificates of death in six medical cases, signed by the offender, were forwarded to the Society, with an *epitome* of the evidence. In the former, there was abundant specific testimony of acting and practising as an apothecary. Now, what is the use of the Society, if not to take immediate action in cases of this sort? Has it any right to put its licentiates to the expense of a mandamus to ascertain whether it has any discretionary power vested in it to refuse a consent in this class of cases? We know it may be said on behalf of the Society that it has not refused consent in either of these two cases. It has not, however, granted the consents applied for, though the cases have been under its notice *upwards of six weeks*. In one—the Welsh case—our clients have received an intimation that the Society is willing to consent to the institution of proceedings in the County Court; but is this a kind of case that ought to be tried and decided by a County Court judge? Nor should our clients be exposed to the extra costs which any defendent proceeded against in the County Court is entitled to incur, to remove the cause to one of the Superior Courts—in fact, to repeat the costly and tedious proceedings which occurred in Shepperley's case, and to leave them open, in case the defendants are unable to pay, to all the extra expenses which would be the consequence of such a course.

The Society appears to be prepared to leave its licentiates and the public to the mercy of the quacks, and to put its licentiates to the expense of applying for and arguing a writ of mandamus to ascertain what their discretion is to withhold even the qualified sanctions they have previously given. In the actions which our clients have instituted, not only has the Society been relieved of every halfpenny of expense, but when the penalty (£20) has been recovered it has actually applied for, and received *half* the amount—*i.e.*, it has been paid £10 for its licence to prosecute in each case. These being the facts, where does the revenue of the Society go? and for what purposes is it applied? Certainly not in the execution of the Apothecaries' Act. As this question does not relate to the prosecution of quacks, we do not desire to pursue it; but in our humble judgment, Sir, the Society deprives itself of the *only* claim it has on the consideration of the profession and the public, in officially announcing not only that it has *not* conducted the prosecutions, but that the feeling of its leading members is undoubtedly adverse to them.

We are, Sir,

Your obedient servants,

GREEN & PRIDHAM,
Solicitors to the Medical
Defence and Medical
Alliance Associations.

5 Verulam Buildings, Gray's Inn,
January 2nd, 1879.

## MODERATE DRINKING.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The paper of Dr. Morton on "The Mortality Referable to Alcohol," suggests the inquiry whether a large amount of what is physiologically the intemperate use of alcohol is not covered by the expression, "Moderate Drinking." It is therefore of the utmost importance to ascertain what it is customary to consider a moderate use of stimulants.

We all know what is a moderate use of bread or beef. As to one's sensations, it is eating slowly till one is satisfied. As to quantity, it is eating daily from half a pound to a pound of bread, and from half a pound to a pound and a half of meat. So of other articles of diet. The appetite forms an excellent guide as long as it is supplied with wholesome, well-cooked food, not in too great variety. People generally eat too much only when they eat to kill time, or when they are tempted by a variety of cookery. Those who have sufficient occupation of mind and body seldom eat too much, and all such may sit down to dinner day after day and eat till they are satisfied without any dread of undermining their constitution or laying the foundation of insidious disease. With alcoholic drinks, on the other hand, the case is wholly different. One cannot sit down and drink of these till he is satisfied with the same assurance that his sensations will warn him when he has taken enough. *Enough* does not take away the appetite for *more*. There is, therefore, no easily accessible standard by which to determine what moderate drinking consists in, and very great discrepancy will be found in the estimate of what it is. A thirsty iron puddler considers six to ten quarts of porter in the day moderate drinking. And so it is to him, so far as the quantity of water is concerned. But how about the alcohol which is taken with it? Can that be taken with impunity in such quantity? And yet there is nothing in his sensations to warn the man that he is exceeding moderation. His quart of porter quenches his thirst for the time, but does no more. It gives no such sense of repletion as eating a pound of beef steak does, and therefore when the thirst returns in an hour, he is quite ready to repeat the draught.

But to turn to less extreme cases. I believe a tumbler of punch after dinner, and the same at bedtime, would not be considered as other than a moderate use of stimulants. Many would consider two on each occasion not too much. One shilling and threepence a day is the usual allowance for "wine money" on board of ship. That means about five glasses of sherry. Dr. T. K. Chambers gives as his own daily allowance from five to seven glasses of port or sherry. On the whole, therefore, one cannot be far wrong in assuming that a moderate use of stimulants, as recognised by the profession and the public, consists in taking from two to five ounces of proof spirit in some shape in the course of the day. Now it would be interesting to know what medical men, whose experience extends over twenty-five or thirty years or more, have to tell of the personal history of patients who have been moderate drinkers during that period. I believe it will be very much like this: Some have become habitual drunkards; some have got those diseases of liver and kidneys which are universally admitted to be pathological effects of alcohol; and a good many are hale, healthy men who have passed the great climacteric, and bid fair to live to a good old age.

I do not think I have put the case at all too strongly against moderate drinking, and it seems to me that in the face of such an impeachment medical men incur a grave responsibility in recommending it.

There is only one answer that can be given to this, and it is that the good outweighs the evil, and that serious mischief, moral and physical, would result from the disuse of alcohol. Sir James Paget has recently gone so far as to assign their drinking habits as a chief reason of the superiority of Occidental to Oriental nations. There have been many prescriptions for the "sick man" since Nicholas of Russia first gave an unfavourable prognosis in reference to him. Diplomatists should turn their attention to this most recent one. England once "drank herself out of the Alabama difficulty." Possibly a solution of the Eastern question might be found in the introduction of the English institution of the public house into Turkey. I would, however, suggest that as swine's flesh is prohibited equally with wine in Moslem countries, possibly the superiority of the West is quite as much due to its bacon-eating, as its bibulous, propensities.

Passing from this, one would like to see a categorical statement of the diseases which result from abstinence from alcohol.

The dyspepsia arising from albuminoid food being altogether withheld is well known as amylaceous dyspepsia, and not less marked is the dyscrasia resulting from fresh vegetables being lacking in the diet. But I confess I never met with a total abstainer's cachexia, nor am I acquainted with any one who ever did. I believe, however, that the ground generally taken is, that though alcohol is not required in a state of health, yet that it is required by many as a habitual medicine. Now without entering on the general question of the value of alcohol as a medicine, since I believe that a great deal has still to be done to define the extent of its curative powers, I must say that it is a most dangerous practice to commit the administration of such a potent drug to the patients themselves. No one would be justified in prescribing strychine, aconite, or digitalis, without constant supervision of the patient and the most watchful care, lest an overdose should be taken. No doubt the risk is not of the same kind in the case of alcohol. There is no danger of a coroner's inquest because a patient has happened to take four doses in one, but the danger is not the less real. Nervous patients, with little sense, and less self-control, find that their daily dose of alcohol brings them wonderful comfort, and as the doctor has prescribed one dose with such good effect, they conclude that another prescribed by themselves will be equally beneficial, and so the drinking habit is formed. I suppose there is not a reader of these columns who cannot call to mind

instances of persons who have acquired drinking habits through medical prescription; and I believe the rule of a recent contributor to your journal is an excellent one—that when alcohol is prescribed it should be so disguised as not to be recognised by the patient, and that it shou d only be taken by him by prescription and while under observation.

It must be clearly understood that in making these remarks I am not looking at the question from a teetotal point of view. I am not taking the ground that drinking wine is morally wrong, either inherently or because a pledge has been taken against it, and that therefore it is equally wrong to drink a teaspoonful or a quart. Neither do I raise the question whether there are any reasons why a man should abstain altogether rather than drink say half a glass of sherry in water at his dinner, seeing that the alcohol in such a quantity of wine can have no physiological effect one way or the other. I simply raise the question, What are the physiological and pathological effects of moderate drinking in the usually accepted signification of the expression? and my contention is that the expression has sufficient latitude to cover an amount of drinking which in numerous instances leads to fatal results.

I would add, in conclusion, that the experience of the Temperance and General Life Assurance Association is of much interest. This Association divides its policy-holders into two classes, professed total abstainers, and persons who make no such profession. The last class must of course include both moderate drinkers and a large number of persons who, though not teetotallers, make only a limited and occasional use of alcoholic drinks. The Association affirms that the mortality among the abstainers is very much less than among the other class, as the latter contains many persons whose use of stimulants does not produce any physiological effect, it would appear that if stimulants be indeed the cause of the difference of mortality between the two classes, they must be debited with even a greater amount of mischief than the mere difference of opinion would show.

I am, &c.,

ALEX. WALLACE, M.D.

Parsonstown, 9th Dec., 1878.

## VACCINATION AND RE-VACCINATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—If it is not too late to reply to your correspondent, "Ivory Point," I beg to say that my opinion on the subject to which he refers is not so paradoxical as he supposes. Judging from the appearance of vesicles which I have seen in persons who have not been vaccinated for many years, I still think that another individual "might be both successfully and harmlessly vaccinated" from such persons, provided they were in a perfectly healthy state, but it would not be "sound practice" to do so, because we cannot *make sure* that the person has not suffered from any disease which may have affected his health, or that sufficient time has elapsed between the first and second vaccinations for the effects of the former to have been completely eliminated from the system. In answer to the questions of your correspondent, I would say that both "the many years" and the "good health" admit of the lymph being pure; that bad health does in many instances undoubtedly modify the character of the lymph, although not perhaps the appearance of the vesicle; and that the effects of a primary successful vaccination may, after many years, be "entirely" eliminated from the system, although it would not be sound practice to rely upon this possibility. I will, however, own that I may be wrong in the opinion which I have expressed, and that were the question submitted to the arbitration of such authorities as Dr. Seaton or Mr. Peel, of Aylesbury, their decision might be in favour of your correspondent.

I am sorry that through an oversight of your printer my letter appeared without a signature, but now remain, as before,

Yours, &c.,

VESICLE.

**Odontological Society of Great Britain.**—At the Annual Meeting held on **Monday, Jan. 13**, the following officers were elected for the year 1879:—President: Edwin Saunders, F.R.C.S. Vice-Presidents: H. J. Barrett, C. J. Fox, T. A. Rogers, H. Campion (Manchester), David Hepburn (Edinburgh), Alfred Meara (India). Treasurer: James Parkinson. Librarian: Felix Weiss. Curator: C. S. Tomes, F.R.S. Honorary Secretaries: W. G. Ranger (for foreign correspondence) Ashley Barrett, M.B., (Council). S. J. Hutchinson (Society). Councillors: H. B. Longhurst, H. Sewill, A. P. Reboul, E. B. West, J. S. Turner, T. Underwood, Oakley Coles, J. Walker, M.D., W. H. Woodhouse, W. Margetson (Dewsbury), W. Campbell (Dundee), J. Doherty (Dublin), W. R. Wood (Brighton), H. Hunt (Yeovil), T. W. G. Palmer (Cheltenham).

## NOTICES TO CORRESPONDENTS.

### SCOTLAND.

YIELDING to the suggestion of some of our subscribers in Scotland, that as England and Ireland are well represented in our columns, the third division of the United Kingdom should not be neglected, we have this week commenced a "Department for Scotland" under the editorship of a well-informed and competent physician, who will keep our readers *au courant* with all that transpires of medical interest, and from time to time will supply the best clinical lectures, and cases obtainble from hospital physicians and surgeons. In this undertaking we shall be in a great measure dependent upon the good feeling and kindness of the staffs of the various Scotch hospitals and schools, who we trust will co-operate with us in order to make this department worthy of the high prestige of the Scotch School of Surgery, and thus enable us to give our readers scattered throughout England, Ireland, India, the Colonies, and America, as much information with regard to the medical doings of our Northern *confreres* as they now have in respect of the other divisions of the United Kingdom.

F.R.C.S.—Such acts do, unfortunately, exist in our profession, as in every other. You did well in not making an abnormal virtue of anomalous illiberality. "The truth will out" sooner or later.

HEALTH OFFICER.—The annual meeting of Public Analysts and Health Officers is announced for this evening (Wednesday), at 5 o'clock, in Burlington House. The annual dinner takes place after the meeting.

DR. SIMPSON.—Thanks for complimentary remarks on our "Literary Notes and Gossip." There is, however, not sufficient stirring in the literary department of the profession to yield notes for this column every week. Thanks, nevertheless, for the suggestion.

E. C.—Letter on "Medical Advertising" will appear in our next.

MR. SOPER, of Reading, has issued a challenge to all other rifle manufacturers in the world to a "killing" competition in which he stakes his reputation that two marksmen with the Soper rifle, which gained the bronze medal at the Paris Exhibition, shall kill more men at the distance for ordinary warfare than three marksmen with any other weapon. Upon whom does Mr. Soper intend practising for this supremely human competition?

DR. GORDON.—We shall be glad to receive the clinical cases for publication.

INDIAN MEDICAL SERVICE.—The next examination of candidates for this department of the public services will be held in London on the 17th February as per advertisement in another column.

L.R.C.P.—The new *Medical Register* will, we understand, be published about the first week in February.

HARVEIAN SOCIETY OF LONDON.—On Thursday, Jan. 16, at 8.30 p.m., "Cases illustrating Diagnosis of Cancer of Uterus in the Early Stages," by Dr. Edis; "Talipes Varus," by Mr. Osman Vincent; "On Digitalis in Spasmodic Affections of Childhood," by Dr. G. de Gorrequer Griffith.

A HUMANITARIAN.—"Frost Cogs" were the invention of Mr. Fleming. You can have them affixed to your horses shoes at any blacksmith, as Mr. Fleming generously declined to patent them.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Liddle, London. Surgeon-General Gordon, C.B., Madras. Dr. Carson, Cincinnati, Ohio. Dr. Winn, London. Mr. Hyslop, Church Stretton. Mr. Taylor, Henbury. Mr. Field, London. Dr. Kisch, Liverpool. Dr. Fixott, St. Heliers, Jersey. Dr. J. W. Martin, Dronfield, Sheffield. Mr. Squire, London. Dr. Black, Glasgow. Mr. Teevan, London. Dr. Knapp, Wyoming, America. Dr. Mare Harrison, Audiem, Cheshire. Dr. James, London. Dr. Pinder, Manchester. Dr. Carey, Taunton. Dr. Barry, New York. Dr. Agar, Ponder's End, London. Dr. Marjolez, Brussels. Dr. Scudder, Cincinnati. Dr. Rumbold, St. Louis, America. Dr. Dolan, Halifax. Dr. de Fonmartin, Greenwich. Prof. Charcot, Paris. Mr. Hemming, Bournemouth. Dr. Donovan, Whitwick. Dr. Stokes, Mullingar. Dr. Hicks, Hendon. Mr. Ley, Prestwich, Manchester. Dr. Vesey, Magherafelt. Dr. Fry, Moate. Dr. O'Farrell, Dunmore E. Dr. Hobson, Ballylinan. Dr. Maguire, Castleknock. Dr. Brownrigg, Moira. Dr. Frazer, Dublin. Dr. Fryer, Fenagh. Mr. O'Grady, Dublin. Dr. Redmond, Cappoquin. Dr. Jones, Rathgar. Dr. Halton, Kells. Dr. Clarke, Dunmurry. Dr. Berry, Mallow. Dr. McIntire, Coleraine. Dr. Haughton, Trinity College. Dr. O'Hagan, King's Court. Dr. Symes, Skemis. Dr. White, Dublin. Dr. Reardon, Bruff. Dr. L. Higgins, Cheltenham. Dr. Bigger, Dublin. Dr. Swan, Abbeyleix. Dr. Macnamara, Corofin. Dr. McGusty, Slane. Dr. Stuart,

Donaghadee. Dr. Sandiford, Castlemartyr. Dr. Vaughan, Lebasheeda. Dr. McNulty, Killala. Dr. Jamison, Newtownards, &c., &c.

### BOOKS AND PAMPHLETS RECEIVED.

The Indian and Colonial Mercantile Directory for 1879. London: Street & Co.

The Family Physician. London: Cassell, Petter, & Galpin.

A Glossary of Biological and Anatomical Terms. By Thos. Dunman. London: Griffith & Farran.

Papers on the Female Perineum. By J. Mathews Duncan, M.D. London: J. & A. Churchill.

Report of the Broadmoor Lunatic Asylum for 1877.

Report on the Sanitary Condition of Islington for 1877.

Manual of Practical Chemistry. By A. W. Blyth, M.R.C.S. London: Griffin & Co.

St. Bartholomew's Hospital Reports. Vol. XIV.

Three Months in the Paying Ward of a London Hospital.

### VACANCIES.

Bristol Royal Infirmary.—Medical Superintendent. Salary, £130, with board and residence. Applications to the Secretary before Jan. 23.

Chester General Infirmary.—House Surgeon. Salary, £80, with board. Applications to the Chairman before Jan. 20.

Clogheen Union, Ardfinane Dispensary.—Medical Officer. Salary, £100, with fees, &c. Election, Jan. 20.

Cootehill Union, Drum Dispensary.—Medical Officer. Salary, £100. Election, Jan. 27.

Crediton Union.—Medical Officer for the Cheriton District. Salary, £40, with the usual fees extra. Applications to the Clerk of the Guardians before Jan. 31,

Inverness District Asylum.—Assistant Medical Officer. Salary, £80, with board. Applications to Dr. Aitken before Feb. 8.

Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70, with board. Applications to the Chairman before Jan. 31.

Liverpool Dispensaries.—Two Assistant House Surgeons. Salary, £108 per annum each. Applications to the Secretary before Jan. 22.

Mallow Union Workhouse.—Medical Officer and Consulting Sanitary Officer. Salary, £100. Election, Jan. 24. (See Advt.)

Manchester Hospital for Sick Children.—Lady Superintendent. Salary, £100, with board and residence. Applications before Feb. 1. (See Advt.)

Sussex Lunatic Asylum, Hayward Heath.—Apothecary. Salary, £100, with board. Applications to Dr. Williams, Medical Superintendent.

Swinford Union, Kilkelly Dispensary.—Medical Officer. Salary, £100, with fees, &c. Election, Jan. 18.

Tuam Union, Abby Dispensary.—Medical Officer. Salary, £120, with fees, &c. Election, Feb. 3. (See Advt.)

Warrington Infirmary.—Resident Surgeon-Apothecary. Salary, £200. Applications to the Hon. Sec. before Jan. 21.

### APPOINTMENTS.

Barnes, Dr. F., Assistant Physician to the Royal Maternity Charity.

Bridges, A. C., L.S.A.L., Assistant House Surgeon to the Cumberland Infirmary.

Caithness, J., M.D., Deputy Coroner for the County of Denbigh.

Cross, F. R., F.R.C.S., a Surgeon to the Royal Infirmary, Bristol.

Hamilton, S., L.R.C.S.I., L.K.Q.C.P.I., appointed by the Secretary of State for the Colonies to be Medical Officer of the Falkland Islands.

Hassant, W. H., F.R.C.S.E., Assistant Surgeon to the Royal Infirmary, Bristol

Hope, W. M., M.R.C.S., House Surgeon and Secretary to the Stamford, Rutland, and General Infirmary.

Morgan, W., Ph.D., Public Analyst for the County of Pembroke.

Smith, J. G., M.B., a Surgeon to the Royal Infirmary, Bristol.

## Marriages.

Moorhead—Dibben.—Jan. 9, at Holy Trinity Church, Bournemouth, John Moorhead, M.A., M.D., and J.P. of Weymouth, to Harriette Fanny, eldest daughter of Harry Dibben, Esq., of Crichel, Dorset.

Robinson—O'Reilly.—Dec. 31, at Clontarf Church, William Robinson, L.K.Q.C.P.I., &c., Newtownhamilton, co. Armagh, to Sarah Isabella, youngest daughter of the late Edward Sterling O'Reilly, Esq., of Enniskeen, co. Cavan.

## Deaths.

Barry.—Dec. 30, at Mallow, co. Cork, Phillip Barry, M.D.

Behrend.—Jan. 9, at 26 Norfolk Cresent, London, W., Priscilla, the wife of Dr. Hy. Behrend.

Black.—Jan. 2, at Donegal House, Green Lanes, Stoke Newington, Robert John Black, M.D., aged 50.

Blackeney.—Jan. 3, at Chester Street, Birkenhead, William Purdon Blackeney, L.F.P.S.G., aged 47.

Byass.—Jan. 9, at The Holly Trees, Rayleigh, James Byass, M.R.C.S., aged 81.

Carter.—Jan. 5, at 52 Upper Parliament Street, Albert Edward Carter, L.R.C.S.I.

Good.—Dec. 29, at Launceston, Thomas Good, M.R.C.S.E., aged 74.

Otway.—Jan. 10, at 13 Kennington Park Road, S.E., C. W. Carrol Otway, F.R.C.S., aged 63.

Owen.—Jan. 6, at Florence, Italy, J. Smyth Owen, Madras Medical Service, aged 75.

Saxton.—Jan. 6, at Berkeley Gardens, Kensington, William Waring Saxton, L.R.C.P.Ed.

Stillwell.—Jan. 5, at Epsom, George Stillwell, M.R.C.S.E., aged 73.

Wade.—At Belturbet, co. Cavan, William Maxwell Wade, F.R.C.S.I., aged 78.

Walker.—Dec. 29, at Hampton Terrace, Whalley Range, Manchester, John Walker, M.B., aged 30.

## NEW SUBSCRIBERS for 1879.

We beg to tender our warmest thanks to the following gentlemen for the extension of their patronage to this journal as New Subscribers. Our thanks are equally due to our numerous Old Subscribers for their continued support, scarcely one of whom has discontinued the journal for the New Year. We would also acknowledge, with thanks, the receipt of several congratulatory letters on our journal having attained the 40th year of its circulation, as well as the good wishes of the writers for continued success.

# IRISH POOR-LAW INTELLIGENCE.

## CONTAGIOUS DISEASES ACT.

29 Vict., Cap. 35, 11th June, 1866.

An Act for the better Prevention of Contagious Diseases at certain Naval and Military Stations.

Be it enacted by, &c.

1. *Short Title.*
2. *Interpretation of Terms.*
3. *Act to commence from Sept.* 30, 1866, *and then* 27 & 28 *Vic.*, c. 85, *cease to operate.*

### Extent of Act.

4. *Act to Extend only to Places in Schedule of Amendment Act.*

### Expenses of Execution of Act.

5. *Expenses of Act to be Defrayed by Admiralty, &c.*

### Visiting Surgeons.

6. *Appointment of Visiting Surgeons and Assistants.*—The Admiralty or the Secretary of State for War may, on the commencement of this Act, appoint a medical officer for each of the places to which this Act applies, to be, during pleasure, visiting surgeon there for the purposes of this Act, and may from time to time, on the death, resignation, or removal from office of any visiting surgeon, appoint another such officer in his stead.

The Admiralty or the Secretary of State for War may, from time to time as occasion requires, appoint a medical officer to be the assistant of any such visiting surgeon; and every such assistant shall have the like powers and duties as the visiting surgeon to whom he is appointed assistant.

A notice of the appointment of every such visiting surgeon and of every such assistant shall be published in the *London* or *Dublin Gazette*, according as the place for which he is appointed is in *England* or in *Ireland*.

A copy of the *Gazette* containing such a notice shall be conclusive evidence of the appointment.

### Inspector of Hospitals.

7. *Appointment of Inspector and Assistant Inspector of Certified Hospitals.*—The Admiralty and the Secretary of State for War shall, on the commencement of this Act, appoint a medical officer to be, during pleasure, inspector of certified hospitals under this Act, and shall from time to time on the death, resignation, or removal from office of any such inspector, appoint another such officer in his stead.

The Admiralty and the Secretary of State for War may, from time to time as occasion requires, appoint a medical officer to be an assistant inspector of certified hospitals under this Act, which assistant shall have the like powers and duties as the inspector.

A notice of the appointment of every such inspector and of every such assistant shall be published in the *London Gazette*.

A copy of the *Gazette* containing such a notice shall be conclusive evidence of the appointment.

### Certified Hospitals.

8. *Power to Admiralty &c., to Provide Hospitals, and Certify them.*—The Admiralty or the Secretary of State for War may from time to time provide any buildings or parts of buildings as hospitals for the purposes of this Act; and every certified hospital so provided shall be placed under the control or management of such persons as to the Admiralty or the Secretary of State for War from time to time seem fit.

9. *Power to Certify other Hospitals.*—The Admiralty or the Secretary of State for War may from time to time, on such application or with such consent as to them or him seems requisite, and on the report of the inspector of certified hospitals, certify in writing any building or part of a building (not provided as a hospital by the Admiralty or Secretary of State for War) to be useful and efficient as a hospital for the purposes of this Act, and thereupon that building of part of a building shall be deemed a certified hospital under this Act.

10. *Inspection of Certified Hospitals.*—The inspector of certified hospitals shall from time to time visit and inspect every certified hospital.

11. *Power to Withdraw Certificate.*—The Admiralty or the Secretary of State for War may at any time, by declaration in writing, declare the certificate relative to any certified hospital withdrawn as from a time specified in the declaration, and thereupon the same shall cease to be a certified hospital as from the time so specified.

12. *Provision for Moral and Religious Instruction.*

13. *Certificate and Declaration of Withdrawal to be Gazetted.*

14. *Power to make Regulations for Certified Hospitals.*—The managers or persons having the control or management of each certified hospital shall make regulations for the management and government of the hospital, as far as regards women authorised by this Act to be detained therein for medical treatment, or being therein under medical treatment for a contagious disease, such regulations not being inconsistent with the provisions of this Act, and may from time to time alter any such regulations; but all such regulations, and all alterations thereof, shall be subject to the approval in writing of the Admiralty or the Secretary of State for War.

### Periodical Medical Examinations.

15. *Justice may Issue Notice to Woman who is a Common Prostitute.*—This Sec. repealed by Sec. 4 of Amendment Act.

16. *Power to Justice to Order Periodical Medical Examination.*—In either of the following cases, namely—

(*a*) If the woman on whom such a notice is served appears herself, or by some person on her behalf, at the time and place appointed in the notice, or at some other time and place appointed by adjournment:—

(*b*) If she does not appear, and it is shown (on oath) to the justice present that the notice was served on her a reasonable time before the time appointed for her appearance, or that reasonable notice of such adjournment was given to her (as the case may be)—

The Justice present, on oath being made before him substantiating the matter of the information to his satisfaction,

may, if he thinks fit, order that the woman be subject to a periodical medical examination by the visiting surgeon for any period not exceeding one year, for the purpose of ascertaining at the time of each such examination whether she is affected with a contagious disease; and thereupon she shall be subject to such a periodical medical examination, and the order shall be a sufficient warrant for the visiting surgeon to conduct such examination accordingly.

The order shall specify the time and place at which the woman shall attend for the first examination.

The superintendent of police shall cause a copy of the order to be served on the woman.

17. *Voluntary Submission.*—Any woman in any place to which this Act applies, may voluntarily, by a submission in writing signed by her in the presence of and attested by the superintendent of police, subject herself to a periodical medical examination under this Act, for any period not exceeding one year. (See Sec. 6 of Amendment Act.)

18. *Power of Authorities to make Regulations as to Examinations.*

19. *Visiting Surgeon to Prescribe Times,* &c.—The visiting surgeon, having regard to the regulations aforesaid, and to the circumstances of each case, shall at the first examination of each woman examined by him, and afterwards from time to time as occasion requires, prescribe the times and places at which she is required to attend again for examination; and he shall from time to time give or cause to be given to each such woman notice in writing of the times and places so prescribed.

*(To be continued.)*

## BOYLE UNION.

### FEES IN SANITARY PROSECUTIONS.

READ letter from Dr. O'Farrell, claiming fees for attending at vaccination and sanitary prosecutions. Also letter of the Local Government Board pointing out that the medical officer was entitled by law to these fees.

Dr. O'Farrell said he did not wish to press the guardians, but if it was paid in other unions it must be paid here.

Mr. Lawrence thought the question was, were they bound to pay, as the board did not order the doctor's attendance.

Mr. Stuart said the section of the Act was against the dootor's application.

Dr. O'Farrell said he considered it a special duty, and it was for the board of guardians or the Local Government Board to say whether it was or not. He believed he was right in saying it was paid in other unions. Of course it seemed absurd to get medical evidence in some of these small cases.

Mr. Stuart said the magistrates gave no certificate.

Dr. O'Farrell stated that was only required under the Vaccination Act. His attention was called to the fact that he was entitled to a fee from a paper issued by the Medical Association.

Mr. J. MacDermot asked if there were twenty or thirty cases would he expect a fee in each case?

Dr. O'Farrell replied certainly not.

Mr. MacDermot said the board now had Dr. O'Farrell's explanation, and asked had any gentleman anything to propose,

Resolved—That the Local Government Board be requested to advise this board on the application of Dr. G. P. O'Farrell for a fee for his attendances at Boyle Petty Sessions Court in a recent sanitary prosecution, under section 258 and section 289 of the Public Health Act, 1878. The board did not specially order the attendance of the doctor at the prosecution in question, nor would they have considered it necessary to do so, the case before the court being merely as to whether a particular house in Boyle was out of repair or not. The executive sanitary officer states he had required the doctor to attend at the prosecution. The board wished to point out that Dr. O'Farrell was appointed prior to the passing of the Act 41 and 42 Vic., and they desire to know if he can claim to come within the terms of section 258, bearing in mind the provisions of section 280.

Mr. Lawrence said as that resolution was passed, he begged to propose another, which was seconded by Mr. Devine:—Resolved, that our executive sanitary officer be directed not to require the attendance of any of our medical officers at any of our sanitary prosecutions, without first having got the special direction of this board to do so.

## BALLYROAN DISPENSARY.

### VACCINATION.

THE following letter and reply were forwarded to the Board:—

"Local Government Board, Dublin,
"6th December, 1878.

"SIR,—I have been directed by the Local Government Board for Ireland to acknowledge the receipt on the 18th ult., of your return Form relating to the Ballyroan Dispensary District for the quarter ended the 30th September last, from which it appears that only eight cases of vaccination were performed during the quarter, although it appears that sixteen births are registered during the quarter ended the 31st March last, and I am to request that you will furnish the Local Government Board with an explanation on the subject.

"I am at the same time to request that you will be more punctual in future in forwarding your returns to this office.

"By order of the Board,
"To Dr. Moutray." "B. BANKS, Sec.

REPLY.

"Ballyroan, Wennesday.

"SIR,—With reference to your query as to the Registrar's return, I beg to reply that I believe the explanation of the non-attendance of more children is this: that to keep my promise of no 'defaulters by 20th June,' house-to-house visitation was undertaken as a *dernier resort*, and if it secured those overdue I believed it induced others to believe when their time came I would look them up at their own houses too. I regret to admit a very large want of perception of the benefits of vaccination that has almost reduced to *nil* an effort made at re-vaccination, in view of the advent of small-pox to neighbouring districts.

"I have to thank you for a very mild rebuke on my negligence in returning returns. I plead guilty, and promise amendment.

"Very obediently yours,
"CHAS. D. MOUTRAY.

"P.S.—I want a midwife urgently in this district, and shall be glad of your Board's support and instructions.
"C. D. M."

## ATHY UNION.

### EXTRA REMUNERATION FOR SMALL-POX SERVICES.

THE following letter was read:—

"Local Government Board, Dublin,
"28th December, 1878.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of minutes of proceedings of the Board of Guardians of Athy Union on the 18th inst., containing an entry of their letter of the previous day's date, relating to the remuneration proposed to be allowed to the medical officer of the workhouse, in respect of his services in attending small-pox patients during the present epidemic; and with reference to the resolution on the subject, the Local Government Board desire to state that it is competent for the Guardians to recommend reasonable remuneration to the medical Officer for the extra duty referred to, subject to the approval of the Local Government Board. The usual practice is to devote a sum of money at the termination of the extra duty.

"B. BANKS, Secretary.

Dr. O'Neill—The Local Government Board were asked to inform the Guardians whether it was my duty to attend the auxiliary hospital or not. That is no answer to the question. I would recommend the Guardians to request a distinct answer to their question. If it were not his duty to attend he would at once cease to discharge the duties, and would require no recompense for his past services; and, on the other hand, if it were his duty he would continue to perform it, and would not seek for any extra remuneration. But he would wish to have the matter settled one way or the other.

Mr. Leahy—I cannot see that it was the doctor's duty to attend the auxiliary hospital at all. Suppose you erected one at Stradbally, would you ask Dr. O'Neill to attend that?

Chairman—I am strongly of opinion that had you insisted on your original resolution they would have given in. If you leave it until the epidemic is over, doctor and chaplain may be both dead.

It was unanimously resolved to press for an answer to the Board's question.

### THE CASE OF ANDREW GERAGHTY.

The following correspondence was read respecting the man named Andrew Geraghty who walked from Monasterevan to the Athy Workhouse while suffering from small-pox:—

"Monasterevan, Dec. 23, 1878.

"Dear Sir,—In reply to your communication concerning Andrew Geraghty, I beg to state for the information of the Board of Guardians that on the 16th inst. he was brought to me in charge of the police of this town, who wished to have him examined as to his statement—viz., 'that he was suffering from small-pox.' I examined him, and found that he suffered under a very modified form of the disease. I gave a certificate to this effect, and directed Constable Bethel to communicate immediately with relieving officer Burke, in order that the workhouse car might be provided for the man's removal to hospital. Geraghty remained in charge of the police, and I know nothing more of the case. Under the circumstances I consider my responsibility there and then ended. I would now respectfully ask the Board of Guardians to give some definite instructions as to how tramps like Geraghty are to be treated here. On complaining of being ill they are immediately turned out of their lodgings (if they have any), and of course not allowed in any where else. This has sometimes occurred here at night. The relieving officer now lives nearly three miles from this town, and in an opposite direction to the workhouse. I would ask then—who is to provide or pay a messenger to communicate with him? Where is the patient to be kept in the interval between the tramp being turned out and the arrival of the car?—a space of time that may cover many hours. I have had on some occasions to let tramps into the dispensary-room, where they remained some days until fit to be removed—the patients, in the meantime, having to be attended in their presence. Is a case of small-pox to be taken thus into the dispensary? Yet it is the only possible place in this town where he could shelter himself from the open air. Until a car be provided for this town and district, cases similar to Geraghty's, or the others I have mentioned, must occur.

"Your obedient servant,
"M. Darby, Medical Officer."

Mr. Reeves—I do not think it is all proper to have the relieving officer living three miles from Monasterevan.

The relieving officer was called before the Board, and, in reply to the chairman, said he lived about two miles from Monasterevan.

Mr. O'Beirne considered that the relieving officer could not attend to his duties and live such a distance from the town.

The matter was referred to the dispensary committee

### THE CHARGE FOR PAY PATIENTS IN THE FEVER HOSPITAL.

It appeared that a bill for £8 7s. 6d. having been furnished to a sub-constable of constabulary from Ballylinan, for his maintenance and medical relief during forty days that he was an inmate of the fever hospital, the sub-constable now came before the board to complain that the charge was too high.

Dr. O'Neill—You charge him £2 10s. for my attendance on him, and I only receive £30 a year for my entire attendance on the hospital. There were 45 or 50 patients in the hospital when he was there, and these of course I had to attend as well. I cannot understand how you make that bill out.

Clerk—I did not make out the bill at all.

Chairman—But I thought, doctor, you got special fees from patients able to pay?

Dr. O'Neill—But I never get them.

Master—The actual average cost at that time was 15s. per week, and 8s. per week for nursing. I did not consider it too much. Perhaps Dr. O'Neill might think the £2 10s. for medical attendance too high?

Dr. O'Neill—I do not see how you can make it out at all. As I stated before you came in, I had 45 or 50 patients under me at that time, for which I was paid about 10s. per week. At that rate this man's proportion would not be more than about 2s. He consumed I should say about one pound's worth of drugs.

The Constable, in reply to the chairman, said he had no complaint whatever to make of either the treatment or the attendance. He only complained that the bill was too high.

Mr. O'Beirne—Did he cost the ratepayers £8 7s. 6d.?

Dr. O'Neill—He did not.

Mr. O'Beirne—We come here to represent the ratepayers, and we cannot pay any compliment to the constabulary.

Dr. O'Neill—I do not mean to influence the guardians in any way, but this man being a fever patient, was fed principally on arrowroot and rice. At the same time there were in hospital a number of very bad cases of small-pox who were consuming grapes, wines, and many other expensive commodities. In some cases a quart of whiskey a day was consumed by single patients.

Mr. O'Beirne—Is it one person consumed a quart of whiskey in a day?

Dr. O'Neill—Yes, a quart of whiskey. You would be astonished how they improve on it.

After some further conversation, the guardians reduced the bill to £5, and the constable having expressed himself satisfied, withdrew.

### THE REMUNERATION TO THE MEDICAL OFFICER.

The Clerk read the following letter:—

"Athy, January 7th, 1878.

"Dear Sir,—Will you be good enough to inform the board of guardians that my relations with them respecting remuneration for attendance on the small-pox hospital being most unsatisfactory, I would feel greatly obliged to them if they would relieve me of the duties of physician to that institution. Under the present regulation it is very doubtful if I would be entitled to a fee from them for years hence—if ever.—I am, dear sir, truly yours,
"P. L. O'Neill."

Mr. M'Laughlin—As the disease is on the decline, would it not be better for you to remain on until the guardians would be in a position to pay you the remuneration?

Dr. O'Neill—It is most irksome on my part to go on, and not to know how or when I am to be remunerated. The small-pox may continue for some years, and, according to the Local Government Board, as long as a case exists I am not to be paid. If you believe it is not part of my duty, I would much rather you would relieve me of the duties. I have as good a right to have a voice in the regulation of the reward for my services as the Local Government Board, who I believe have treated me very badly. As I said before, you will have cases from time to time, and it will be necessary to have a physician to attend daily.

Mr. M'Laughlin—I will give notice that the subject of the remuneration of Dr. O'Neill be taken into consideration on this day fortnight.

Dr. O'Neill—That has been done before, and even if you repeat it, the Local Government Board will step in and nullify your resolution. I would much rather you would accept my resignation. Even if I have to give up the entire appointment, I would do so rather than remain any longer at the mercy of the Local Government Board.

Mr. O'Beirne—I think it would be better to accept the doctor's resignation, and advertise for another physician. That will bring the matter to a crisis.

Dr. O'Neill—If you think with me that it is not part of my duty to attend the auxiliary hospital, why not accept my resignation and put an end to the matter? There is a case in point in Carlow, where they have erected sheds, which they do not require their doctor to attend.

Mr. M'Laughlin handed in the following notice:—"I hereby give notice that I will, on this day fortnight, move that the guardians take into consideration the amount of remuneration which Dr. O'Neill is entitled to for his services in attending the small-pox patients up to that date.—JOHN M'LAUGHLIN."

Mr. O'Beirne proposed "That as the Local Government Board have declined to give a decisive answer to the board of guardians, as to our medical officer being bound to attend the auxiliary hospital, the board have decided to advertise for a physician to attend it at a salary of £3 per week, Dr. O'Neill having resigned the charge."

## ADARE DISPENSARY.

### ELECTION OF MEDICAL OFFICER.

WE are told by the local papers that a meeting of the Dispensary Committee of the Adare District, in the county Limerick, was held for the special purpose of electing a medical officer for the District.

There were seven applications, but only two candidates presented themselves—Dr. Plummer, Newcastle West; and Dr. Shanahan, Dewsbury, Yorkshire.

A poll having been taken, there voted for Dr. Plummer, 7; for Dr. Shanahan, 11.

Dr. Shanahan was accordingly declared elected; and he returned thanks.

The successful candidate, it should be explained, is brother of a local ecclasiastic; and the Limerick papers return fervent thanks to the Earl of Dunraven "for coming at this season of the year to vote." We should like to know on how many occasions has his lordship attended to committees without an election to bring him there? In what way has he previously manifested his anxiety about the sick poor of the district? How much honour does his lordship deserve for "coming to the scratch" only when there is a politico-religious job to be done? We care nothing for the sect or party of any candidate; but we look upon it as disheartening to see a crowd of persons who don't care a straw for the district, or the poor in it, always ready to run to the crack of the political whip.

## LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF DECEMBER, 1878.

DECEMBER 6th.—Egan, Constantine Richard; 15 Talbot Street, Dublin; M.B. Univ. Dub. 1878, Lic. R. Coll. Surg. Irel. 1878.

7th.—Barrett, John Milford; 15 College Avenue, Belfast; M.D. Univ. Edin. 1852, M. R. Coll. Surg. Eng. 1852.

7th.—Gibson, James Hill; 4 Atlantic Avenue, Belfast; M.D. 1878 and M.Ch. 1878 Q. U. Irel.

14th.—Mackenzie, Murray; The Priory, Queenstown, co. Cork; Lic. R.Coll. Surg. Irel. 1878.

16th.—McLearn. Isaac Crawford; Monreagh, Carrigans, Londonderry; M.D. and M.Ch. 1878. Q. Univ. Irel.

17th.—Tushy, John Francis; 96 Patrick Street, Cork; M.D. Q. Univ. Irel.. 1878.

17th.—Horne, Andrew John; Ballinasloe, co. Galway; Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel., Lic. R. Coll. Surg. Irel. 1877.

20th.—Gubbins, Charles O'Grady; 62 Haddington Road, Dublin; M.B. 1878 and B.Ch. 1878 Univ. Dub.

20th.—Johnston, John Reid; Rockmount, N. T. Stewart, co. Tyrone; M.D. 1878 and M.Ch. 1878 Q. Univ. Irel.

21st.—Gage, Robert Charles; Ballycastle, co. Antrim; M.B. 1878 and M.Ch. 1878 Univ. Dub.

22rd.—Moynihan, John F.; 70 Summer Hill, St. Luke's, Cork; Lic. R. Coll. Phys. Irel. 1878; Lic. R. Coll. Surg. Edin. 1878, Lic. Apoth. Hall Dub. 1878.

23rd.—Yourdi, John Robert; Queenstown, co. Cork; M.B. 1878 and B.Ch. 1878 Univ. Dub.

24th.—Gibson, Joseph; 3 Mark Street, Portrusk, co. Antrim; M.B. 1878 and M.Ch. 1878 Univ. Dub.

28.—Burdon, Daniel; Macroom, co. Cork; M.D. 1878 and B.Ch. 1878 Q. Univ. Irel., Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

28th.—Baker, Fausset Maber; 4 Clare Street, Dublin; M.B. 1878 and M.Ch. 1878 Univ. Dub.

31st.—Magner, Edward; Bishopstown, Cork; M.D. 1878 and M.Ch. 1878. Q. Univ. Irel., Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

31st.—Smartt, Thomas William; 20 Leinster Road, co. Dublin; Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

31st.—Redmond, Denis Daniel; Belmont Lodge, 126 Sandford Road, co. Dublin; Lic. R. Coll. Surg. Irel. 1878.

31st.—Palmer, Walter Stephen; 17 Longwood Avenue, Dublin; Lic. R. Coll. Surg. Irel. 1878.

## WATERFORD UNION.

### THE HONOUR OF A DISPENSARY COMMITTEE.

The Secretary of the Kilmeaden Dispensary Committee wrote to state that the committee had recommended that Dr. Arthur be paid for one day's attendance at their dispensary, his further attendance not being necessary, as Dr. Cutlar had resumed his duties.

The Clerk explained that an application had been made by the relieving officer of the district to discharge the duties during the illness of Dr. Cutlar at three guineas a week. Subsequently the committee *refused payment* for that time, but said they would appoint Dr. Arthur for *a week*, and decide at next meeting who should pay him. Meantime Dr. Cutlar resumed his duties, and now the committee recommended payment for *one day* to Dr. Arthur.

Captain Power thought Dr. Arthur was shamefully treated.

It was decided to refer the matter back to the committee, calling their attention to the fact that Dr. Arthur had been appointed by them for one week.

### RESIGNATION OF DR. ELLIOTT.

Dr. Elliott wrote, resigning the position of medical officer of the workhouse which he has held for thirty-two years. In doing so he thanked the guardians for the consideration they had always shown to him, and expressed a hope that his claim for a retiring allowance would receive a favourable consideration on account of his long services.

Mr. Clampett considered that they might do with one workhouse doctor at a salary of £130 a year. As there was no more than one hundred sick people in the house there was no necessity for two doctors. He begged to move that Dr. Browne be appointod.

Mr. Conn thought Dr. Arthur would be a highly suitable gentleman to act as the medical officer, and he therefore proposed him as *locum tenens*.

After some conversation a poll was taken, when there voted—For Dr. Brown, 7; for Dr. Arthur, 8. The Chairman then gave his vote for Dr. Browne, which made the polling even.

A short discussion then ensued, which resulted in the board dividing to allow the matter to rest for a week, Dr. Browne to discharge the duties in the mean time.

## LETTSOMIAN LECTURES. (a)

### LECTURE I.

### ON BRONCHIAL ASTHMA: ITS HISTORY AND NATURE.

By JOHN C. THOROWGOOD, M.D., F.R.C.P.,

Physician to Victoria Park Hospital for Diseases of the Chest, and to the West London Hospital.

MR. PRESIDENT AND GENTLEMEN.—On unexpectedly receiving at your hands the honourable appointment of Lettsomian lecturer for the present year, my first thought naturally was as to the subject on which I might venture to address you with the prospect of being able to afford such information as would be of interest in its immediate delivery, and of practical utility hereafter.

Fifteen years' experience among patients at a hospital specially devoted to all forms of chest disease, ought, I considered, to supply material from which to make three lectures, each of which shall not exceed forty minutes in time of delivery; and I have accordingly taken as my subject a disorder of the breathing apparatus, which has long interested me much, and of which, as illustrated in a large number of cases, I possess numerous records. In choosing Bronchial Asthma as the subject for my three lectures, I purpose to speak, first, of the history, nature, and mode of production of this disorder, endeavouring thus to establish an accurate definition of the malady; and then to set forth, discuss, and, as far as I can, explain the various and conflicting theories that have been propounded as to the seat and nature of the asthmatic spasm. Secondly, I shall have something to say regarding some special varieties of asthma, and then shall pass to the consideration of bronchial asthma as a secondary neurosis, with its pathological relations and affinities. The third and last lecture will be on the treatment of asthma for purposes of prevention, palliation, and cure.

In speaking of the history of asthma I must of necessity be brief, but it will not be without interest to trace the views held by some very pains-taking observers of old, who lived before the days of auscultation, and before the discovery of reflex and excito-motory movements. Modern research in experimental physiology, diagnosis, and pathology, has done great things in solving the causes of many kinds of dyspnœa formerly regarded as simple asthma; but my own observation of cases and the study of books leaves me still in the belief that we have in our nosology, such a complaint as spasmodic bronchial asthma, an independent and essential disease, purely dynamic in nature, and not of necessity connected with any pathological lesion. Thoroughly typical examples of such an affection I believe are not so common as some may think, and the nature and seat of the spasm, which causes the dyspnœa, is a point very hotly disputed among highly competent observers, all of whom, however, stand apart from others, hardly less competent, who can meet with no case of asthma in which they fail to find some evidence of pathological change of tissue as the essential cause of all the symptoms.

I will now proceed to touch upon such points in the history of asthma as will show by what steps we have been brought to our present state of knowledge of the the disease.

Asthma, in the sense of dyspnœa, or difficult breathing, is said to have been described by Hippocrates, Galen, and Celsus. The last of these writers speaking of asthma, says:—

"Est etiam circa fauces malum, quod apud Græcos aluid aliudque nomen habet. Omne in difficultate spirandi consistit; sed haec dum modica est, neque ex toto strangulat, δυσπνοια appelatur. Cum vehementior est, ut spirare aeger sine sono et anhelatione non possit ἄσθμα; cum accessit id quoque, ne nisi recta cervice spiritūs trahatur ὀρθόπνοια."

From these lines we see that the Greeks, as quoted by Celsus, confined the term *asthma* to a difficulty of breathing, attended with sound, and more severe than the breath struggle called *dyspnœa*. Asthma seemed to imply a mean of breath difficulty, while dyspnœa and orthopnœa were terms applied to the two extremes. As knowledge and observation progressed, the intermittent character of the breath difficulty of asthma was duly observed and

(a) Delivered before the Medical Society of London. Erasmus Wilson, F.R.S., President in the Chair.

insisted on, and we find Boissier de Sauvages, in his Genera Morborum (1768) defining asthma as "Difficultas spirandi *periodice* recurrens, chronica."

We now know that the intermitting, or paroxysmal, character of a dyspnœa is not enough to mark it at once as spasmodic bronchial asthma. We find paroxysmal dyspnœa to be a sign of very different diseases; it may be associated with grave pathological changes of incurable kind in organs other than the lungs, as, for, example, the brain, the heart, or the kidneys.

Sir John Floyer, wrote on asthma in 1698, and there are copies of three editions of his work on asthma in the library of the Royal College of Physicians. One well-preserved copy of the second edition easily came to hand in our own library, thanks to the excellent way in which our library is now arranged and catalogued.

Floyer certainly recognised contraction of the bronchia as the cause of asthma. Like many others who have written on asthma, he was himself a great sufferer from he malady, and he often referred the chief seat of his distress to the diaphragm, which seemed to him rigid and spasmodically drawn up by some contractile force within the thorax, and this force he considered to be the air-tubes and lungs, contracted by an inflation of the membrane lining the chest, and covering the lungs.

The second edition of Sir John Floyer's work was published in the year 1717, and is dedicated to the learned and judicious physician, Dr. Phineas Fowke, of Wyrly Staffre. Allow me to refer to some of his statements and theories as indicating the condition of knowledge at that time :—

Says Floyer — "First, I shall observe that that is the most useful notion of asthma from whence we can take our indications for practice, and which is deduced from an exact and full sensible history of the disease." He then continues—"I have assigned the immediate cause of the asthma to the straitness, compression, or constriction of the bronchia; and in the continued asthma the causes must be constant, as dropsy, tuberculum, &c. The return of periodic asthma depends on the defluxion of humours on the primæ viæ. Thus, the old notion of the asthma being a defluxion of serous humours is certainly true because evident to our senses in the evacuation of serosities."

"Some," continues Floyer (p. 43), "express their feeling during a fit of asthma, as if the lungs rose, and were drawn upwards to choak them. Contraction of the vesiculæ is very probable, because the bronchia are contracted, and the vesiculæ have the same muscular fibres to help expiration, by which they may be drawn so up as not to admit the air."

The motion of the chest and lungs Floyer ingeniously compares to that of a bellows. "We can," says he "move the bellows easily, but suppose a bladder tied within the bellows over the nozzle, so as to receive the air, and suffer none to get into the cavity of the bellows, it will follow that in a perfect stoppage of all the entrances of air the bellows could not be opened, and if no more entered than may be contained in the bladder the bellows would be opened but a little way, and would inspire difficultly. So it appears in the business of the asthma, the inspiration is difficult and laborious, because but little air can be admitted into the contracted bronchia, and the vesiculæ drawn up. This puts the scapular and intercostal muscles and diaphragm upon a violent endeavour to press in the air and open the lungs, which nisus authors have mistaken, and supposed the pneumonic muscles, especially the diaphragm, to be convulsively affected; but it may easily be apprehended that the diaphragm cannot press the viscera downwards to enlarge the breast if the air cannot be admitted into the lungs to follow its depression, and fill the cavity of the breast; and this is the true reason why the diaphragm cannot move in the asthmatic fit. The contraction and stiffness of the lungs during asthma causes a catalepsis or rigidity of the diaphragm—the part most unjustly accused of this tyrannic oppression."

Thus we see that Floyer, while fully cognisant of the rigid state of the diaphragm during a fit of asthma, does not agree with those of the present day who, like Wintrich, Bamberger, and Lehmann, believe a tonic spasm of the diaphragm to be the essential cause of asthma. Floyer considered the wheezing noise in expiration during asthma to be due to contraction of the muscular fibres of the bronchi. That this symptom is not due to phlegm in the tubes, he says, is evident, because the hysteric, who have no phlegm, wheeze much.

Floyer was in error in assuming the presence of muscular fibre in the wall of the pulmonary vesicle. The small bronchi are muscular and elastic—the cells are elastic but not muscular. What Floyer meant by inflation of the membranes around the lungs by humours as a cause of bronchial contraction I do not clearly comprehend; but that he regarded the contraction as brought about by mechanical pressure rather than by nervous influence seems clear from his saying that certain writers of his day, Van Helmont and Dr. Willis, were wrong in regarding asthma as a convulsion, to be treated by antispasmodics, hot tinctures, gums, volatile salts and sulphur medicines. The proper treatment is by evacuants, and remedies calculated to promote secretion and effect the discharge of humours.

Passing on from Floyer to Dr. William Cullen, the distinguished nosologist of Edinburgh, we find him, in his "Synopsis Nosologiæ Methodicæ, published in 1772, defining asthma as "Spirandi difficultas, cum angustiæ in pectore sonsu, *per intervalla* subiens." Cullen appears to have regarded spasmodic asthma as essentially due to constriction of the bronchial muscles, and in his nosology he divides asthma into three groups.

First—Idiopathic asthma, of which kind he enumerates eight varieties.

Second—Symptomatic asthma, two varieties, viz., 1, Asthma arthriticum; 2, Asthma venereum.

Third—Comes a long list of asthmas, dyspnœas and orthopnœas symptomatic of cardiac and pulmonary difficulties and obstructions.

The belief held by Floyer and Cullen that the spasm of bronchial asthma was due to contraction of the smaller bronchial tubes receives plenty of support in the present day. Our late distinguished Fellow, Dr. Hyde Salter, has expressed himself strongly and decidedly as an upholder of the bronchial constriction theory, and among other celebrated men of the same way of thinking I may name Trousseau, Romberg, Bergson, Biermer, Théry, Williams, Walshe, Fuller, Watson, Radclyffe Hall, Gerlach, MacGillivray, and others.

Sir Thomas Watson describes asthma as a difficulty of breathing occurring in paroxysms, and accompanied by loud wheezing sounds "in the respiration; going off after some hours, with more or less mucous expectoration, and unattended by fever. And these paroxysms of dyspnœa are believed to depend upon a spasmodic constriction of the bronchial tubes."

There comes next to be noticed, in the history of the growth of our knowledge of asthma, the theory put forward, and ingeniously supported, by Dr. Robert Bree in 1801. Dr. Bree, when in considerable practice as a physician at Leicester, was attacked so severely by paroxysms of asthma that in 1793 he felt compelled to abandon his profession and accept a commission as captain in a regiment of militia. Under these altered conditions of life Dr. Bree lost his asthma, to return, however, some years later with great severity, rendering the latter portion of his life a period of constant suffering, and at times of the most agonising distress. In 1796 Dr. Bree resumed the practice of his profession in Birmingham, and while there he published his treatise, entitled "A Practical Inquiry into Disordered Respiration, distinguishing the species of Convulsive Asthma, their causes and indications of cure." This work reached a fifth edition, and conferred upon its author a very high reputation, while it brought him also considerable practice. In 1833 Dr. Bree died at his house in Park Square, Regent's Park, at the advanced age of 80 years. The great point in Dr. Bree's theory of the caus

of the asthmatic paroxysm was the presence in the air tubes of some peccant irritating matter which excited the lungs powerfully to effect its discharge. When by the expulsive efforts of expectoration the peccant mucus was thrown off then the spasm in the air tubes came to an end; the desired object having been attained in the expulsion of the mucus. Dr. Bree had observed carefully the facts of an asthmatic paroxysm, but had not correctly interpreted these facts; for, as Salter has well shown, during the asthmatic fit the power of discharge from the lungs by cough is quite in abeyance. Moreover, I hope, as I proceed, to show that the collected mucus is the effect, and not the cause, of the asthmatic spasm.

He who, in the present day, is the nearest exponent of Dr. Bree's theory is Leyden. This observer found in the viscid grey mucus, expectorated on the subsidence of a fit of asthma, brownish masses of cells undergoing granular degeneration, and among these could be made out colourless octahedral crystals, soluble in hot water, and in acids and alkalies, but not in ether, and consisting probably of a substance analogous to mucine. Leyden believes that these sharp crystals irritate the peripheral extremities of the vagus nerve, and produce reflex spasm of the bronchial muscle.

Attempts to prove the connection by experiment appear to have failed, and the presence of these angular crystals is not peculiar to the sputum of asthma, for similar crystals have been found in the expectoration of persons suffering with ordinary catarrh and croupous bronchitis. Leyden possessed the knowledge of reflex nervous spasm, unknown in the time when Dr. Bree wrote; and, I needly hardly say before this Society, that it is to the discovery of excito-motory and reflex nervous action, as well as of auscultation by the stethoscope, that we now owe so much of our knowledge of the true nature and definite varieties of asthma.

Persistent mechanical irritation of the air-tubes by the inhalation of various kinds of dust will produce irritability, swelling, and various degrees of thickening in the lining membrane of these tubes; but asthmatic paroxysms are by no means a constant accompaniment of these pathological conditions.

Workers at dusty employments, mill-stone dressers, knife grinders, and chaff cutters, get their lungs greatly irritated by the dust and fine steel particles they inhale while at work, and the effect is very obstinate chronic bronchitis. Asthmatic paroxysms may co-exist, but such co-existence is certainly not an invariable rule, and depends on the presence or absence of a neurotic or spasmodic element in the case. In six cases of mechanical bronchitis, detailed by Dr. Headlam Greenhow, I find no mention of distinct asthmatic attacks. The tendency of the disease was towards change of structure, rather than to nervous spasm. The trustworthy authority just quoted, in speaking of the asthmatic complications of the so-called "dry catarrh" of Laennec, attributes the dyspnœa partly to narrowing of the bronchi by swelling of their lining mucous membrane, and partly also to spasm of these tubes. That irritation leading to local congestion of the pulmonary mucous surfaces may become the cause of an acute attack of dyspnœa I do not doubt; but before entering further upon this question, I wish to place before you the reasons that make me uphold the doctrine of the existence of an essential independent spasmodic bronchial asthma, dynamic in nature and symptomatic only of some great nervous perturbation in the system; at times centric and emotional, at other times reflex, in its mode of origin, capable, too, of artificial production by direct irritation applied to the trunk of the vagus nerve.

The reasons that have prevailed to establish and maintain in my mind the conviction that we can have a severe spasmodic dyspnœa of purely nervous origin may be divided into two groups—

First—The evidence adduced from observation of cases as regards causation and cure;

Second—The support given by experimental physiology to the belief in nervous spasm as the cause of bronchial constriction.

My own observation has shown me that a most severe fit of bronchial asthma, requiring the inhalation of chloroform for its relief, may develope in the space of two minutes. In another case, a youth going up for examination at Burlington House is breathing with comfort, when the anxiety due to the non-arrival of the carriage to convey him to the place of examination causes a speedy attack of asthma, which subsides as the carriage draws up at the door.

Dr. Chowne reported a case where a dash of cold water over the foot invariably and immediately induced a paroxysm of asthma in a gentleman 50 years old. Dr. Salter affirms that he has seen severe asthma developed in as short a time as thirty seconds.

In 1834 John Ross reported a sudden and severe paroxysm of asthma, brought on by the smell of a parcel of new feathers.

The late distinguished French physician, Trousseau, who was the subject of inherited asthma, used to relate how the worst attack of asthma he ever experienced came on in the course of a few minutes, with intense dyspnœa and oppression, relieved, however, in eight or ten minutes by smoking a cigar. Trousseau was at the time of his seizure up in the hay-loft watching his coachman, whom he suspected of dishonesty, measuring oats, and he attributed his severe attack to emotional agitation. "It could not have been the dust of the oats," says Trousseau, "for I have often been exposed to far more dust, and yet had no asthma." The profuse running from the eyes and nose, however, that Trousseau had, make me think his seizure was a sort of catarrhal asthma due to inhaling dry pollen in the oat dust; this might have caused the profuse coryza; the asthma, doubtless, was emotional and spasmodic.

Trousseau gives a good example of the nervous nature of asthma in the case of the brother of the Chancellor of the Chamber of Peers in Paris, who used to free himself at once from his difficult breathing by having four or five bright lights brought into his apartment. A bad asthmatic, whom I have known for years, declares to me that the contemplation of himself in a looking-glass constantly gives relief to some of his worst attacks. With some the mere presence of a cat, a dog, or a hare-skin, in a room, at once brings on asthma.

Walshe gives a striking instance of asthma occurring as a primary neurosis of emotional, or centric, origin in the case of a man, very liable to spasmodic asthma, who always carried in his pocket some cigarettes made of belladonna and stramonium. One day, at a distance from home, he suddenly found he had forgotten his cigarettes. Instantly he had a violent paroxysm of asthma.

Salter has noticed asthmatic seizures to alternate with those of epilepsy; and Eulenberg has seen paroxysmal breath seizures occur in alternation with hemicrania and angina pectoris.

The great relief to the asthmatic fit often obtained by the inhalation of the fumes of tobacco, stramonium, and belladonna, and the speedy way in which chloroform vapour dissipates the spasm, further support the belief in the neurotic character of the seizure; and the more the nervous spasm predominates, the more certain is the relief obtained by the use of the above-named agents—a point I hope to work out satisfactorily when I come to the matter of therapeutics in my third lecture.

Observations that I have had opportunities of recording have shown that there is no rise of body temperature during a night of intensely severe asthma, brought on by nervous excitement. Such are a few of the facts that make me think we must admit into our nosology bronchial asthma as an essential primary neurosis. Now comes group of evidence No. 2, based on physiological experiment, as well as on clinical observation; and here I approach the question so warmly contested just now, as to what part of the respiratory mechanism is the seat of the nervous spasm. Let us look first at the result of experiment. We find in

the very smallest bronchial tubes a distinct layer of smooth muscular fibres disposed between an external and internal layer of elastic fibres. These elastic fibres support the borders and angles where several alveoli meet, and they are further distributed in a retiform manner over the alveoli of the lung. This membranous wall of th e air cell, according to Stricker, is entirely devoid of all trace of muscular fibre, and the air cells were found by Dr. Williams, in 1841, to possess little contractile force under the influence of galvanic or chemical excitation, though the lung by its elasticity is capable of contracting generally to about one-third of its ordinary bulk when the thorax is opened.

The contractility of the muscular element in the small bronchial tubes under the influence of mechanical, chemical, and electrical stimulants was ingeniously demonstrated by Dr. C. J. B. Williams as long ago as 1840. Afterwards Longet and Volckmann showed that irritation of the vagus nerve would produce contraction of the lung, or rather of the bronchial muscle. The last of these observers, saw the lung contract, when the vagus was irritated, with force sufficient to blow out a candle. Paul Bert, Gerlach, and more recently Dr. H. MacGillivray, have confirmed these results, so that, as Riegel, one of the most recent writers on asthma, says, "It is therefore now no longer doubtful that the bronchial muscles can be excited to tonic contraction under the influence of the vagus nerve."

Biermer thinks that the bronchial muscle in a spasmodic state may form a sphincter-like occlusion more readily overcome in inspiration than in expiration, and that thus the escape of air from the pulmonary alveoli is impeded. The expected result of this state of things would be over-distension of the air cell and ultimate production of emphysema, and this is what we may often observe actually to occur. Recent observations by Paul Bert tend to show that arrest of respiration can take place in that phase of the respiratory act during which the nerve irritation is applied, and a more powerful nerve excitation is required to produce stasis in inspiration than in expiration. Bert has also demonstrated, as Williams had done before, that after excessive inflation of the lung the bronchial muscle could not be excited to contract; but Williams observed that on waiting a minute or two contraction took place, only diminished in degree by the compressed state of the air, which required more contractile force to move it. I quote the original paper of Dr. Williams, kindly placed at my disposal by Dr. Theodore Williams.

## CALCULUS IN THE FEMALE BLADDER. (a)

By LOMBE ATTHILL, B.A., M.D. Dub., F.K.Q.C.P.;
Master of the Rotundo Lying-In Hospital; Consulting Obstetric Physician to the Adelaide Hospital, &c.

TRUE calculi of large size are comparatively rarely met with in the bladder of females. That this is so, is doubtless, due to the fact that the urethra in women readily permits the passage of a stone of small size. The case I am about to detail is remarkable, alike from the size of the calculus, its great hardness, and the long continuance of the symptoms, which point, as does the structure of the stone, to the conclusion that it had been for many years in process of formation.

A. M., a widow, æt. 54, was admitted into the Rotundo Auxiliary Hospital on the 24th of September last. She complained of being tormented with an incessant desire to micturate; even at night she had to get out of bed every half-hour for that purpose, while the act of passing water caused her some pain. The urine was turbid, highly ammoniacal, and contained much mucus.

She stated that she had been a sufferer for ten years, the first symptom being a feeling of discomfort in the region of the bladder. Soon after this she perceived that the flow of urine would be sometimes suddenly arrested; this, no doubt was caused by the calculus blocking up the orifice of the urethra. Subsequently this symptom disappeared, probably when the calculus became too large to be affected by the stream of urine. Of late her sufferings were greatly aggravated, and at last she was compelled to seek relief.

On passing a sound into the bladder a calculus, evidently of large size, was detected, but there was such extreme irritation of the bladder, urethra, and labia, that I thought it better to postpone any operative measures for a few days till her condition in these respects could be somewhat improved. She was accordingly ordered warm hip baths, the bladder was syringed out with a weak solution of carbolic acid daily, and on the 30th of September she was so much better that I resolved to attempt to remove the stone. It was obviously desirable, on account of its size, that it should be crushed, but, as I anticipated that the fragments would be large, I thought it best, with the view of facilitating their removal, first to dilate the urethra. This was effected in the course of twenty-four hours, and without much distress to the patient, by the introduction of four pieces of sea tangle. The urethra then permitted the passage of the index finger into the bladder, and a large rough stone could be distinctly felt. This was without much difficulty seized by a lithotrite, but it proved to be so hard that no effort sufficed to crush it; and as it was too large to be drawn through the urethra, even though it had been previously dilated, I was obliged to abandon the attempt for that day.

The dilatation of the urethra d d not cause very much pain, and the attempt to crush and extract was made whilst the patient was under the influence of ether.

After the lapse of two days, the patient's health not having altered materially, I dilated the urethra a second time in the same manner as before, employing however a larger number of pieces of sea tangle. I also procured a much stronger lithotrite, and had the advantage of Mr. Porter's assistance. The patient being again etherised, the stone was after a little difficulty grasped by the lithotrite, but, as on the former occasion, our efforts to crush it failed altogether, and I had no resource but to extract it through the now widely dilated urethra. This was at length effected by means of a pair of small ovum forceps, but not without much difficulty and the exercise of considerable force.

The patient complained of a good deal of pain subsequently; this was relieved by the use of a morphia suppository. There was incontinence of urine for about a week; after that time she could retain water for a couple of hours; the urine, however, continued to contain a considerable quantity of mucus, and I therefore wished to keep her in hospital for some time. She, however, would not remain, and I have lost sight of her. Her condition at the date of her discharge was much improved, and she considered herself cured.

My friend, Dr. Cruise, kindly made a section of the calculus; the following is his report:—

"The stone which you confided to me to cut through is a very interesting specimen. It is of extraordinary hardness,—so much so, that it took over half an hour to make the section with a fine saw.

"The divided surface is very instructive as regards the formation of this stone, which I believe occupied several years. In the centre you see three nuclei of fawn-coloured lithic stones, held together by a small quantity of the same material. Outside of this a deep layer of very hard dark lithic deposit, irregularly laid on, and I suspect with some mixture of oxalate of lime. Now a couple of layers of light-coloured lithate of ammonia, and outside all a deep layer of phosphates, due, no doubt, to the irritation of the bladder set up by the gradually enlarging stone."

(a) Read before the Surgical Society of Ireland.

I had on several occasions previously dilated the female urethra to a considerable extent, but never before to such a size as in this case, and I confess I felt much anxiety lest in the unhealthy condition this woman was in it would not regain its tone, for the stone when extracted was the size of a large walnut, and much force had to be employed, and some laceration took place; but no unpleasant symptom followed, and I believe, had the patient remained in hospital she would have become perfectly well.

The case, then, is to me in this respect specially interesting, for I believe that some of the very troublesome cases of chronic inflammation of the bladder, which are not uncommon in women, are capable of being benefited by the free dilatation of the urethra, a method of treatment advocated by Dr. Matthews Duncan, and practised by me on several occasions, and this case seems to show that even extreme dilatation of the urethra in the female is not a dangerous proceeding.

It seems almost incredible that this poor woman could have borne the distress and suffering caused by this large rough stone for so many years without seeking relief, but so it appears to have been. Her condition when she came into the hospital was most lamentable.

## THE OTOLOGY OF THE LAST TEN YEARS.

By Dr. GUERDER,
Of Longwy.

Translated from the *Annales des Maladies de l'Oreille, du Larynx et des Organes connexes*,

By W. DOUGLAS HEMMING, M.R.C.S.,
Assistant-Surgeon, Central London Throat and Ear Hospital, Surgeon to the Notting Hill Dispensary, &c.

(*Continued from page 495, Vol. XXVI*).

### IV.—PHYSIOLOGY OF THE CONDUCTING APPARATUS.

UNTIL a few years ago we possessed only hypotheses of a more or less ingenious nature with respect to the action of the apparatus for the conduction of the sonorous waves from the external air to the labyrinth. According to the oldest theory, the muscles of the ossicular chain had for their object the protection of the expansions of the auditory nerve against the influence of too strong vibrations acting violently against the membrana tympani and the chain of bones. Another hypothesis, founded solely on analogy, attributed to these little muscles an action of accommodation similar to that of the apparatus of accommodation in the eye. These muscles had for their function to adapt the ear to the perception sometimes of low sounds, sometimes of high ones. A modification was introduced into this theory by Mach. (*a*)

According to this author, by the action of the muscles of the ossicles, we are able, when we listen attentively, to fix upon certain sounds, isolate and follow them, just as we are able, with the eye, to follow a point which is moving in space. As the perception of the space in which an object moves is the effect of a series of muscular sensations, so the perception of sounds will only be a series of sensations residing in the muscles of the ossicles in various states of contraction and relaxation. Lastly, Magnus and Kramer do not attribute any function to the muscles of the ossicles. According to them, they are simple ligaments whose muscular structure has no other end but to render them more elastic.

Rosenmüller (*b*) had a clear perception of the action of the internal muscle of the malleus; he says it draws the malleus inwards, increases the concavity of the membrana tympani, and the pressure of the stapes on the fenestra ovalis, and consequently on the fluid of the labyrinth.

(*a*) Mach. "Zur Theorie des Gehörorganes." 1863.
(*b*) "Handbuch der Anatomie." Leipzig. 1838.

Toynbee (*a*) first established the antagonistic action of the stapedius and the tensor tympani. In studying the action of the stapedius on the intra-labyrinthine pressure, he perceived that traction on the muscle caused a depression in the level of the liquid, but he saw at the same time that it produced a movement outwards of the long process of the incus and of the handle of the malleus, accompanied by some relaxation of the membrana tympani. He concluded from this that the stapedius had an action antagonistic to that of the internal muscle of the malleus.

Bonnafort, (*b*) who does not appear to have been aware of these foreign investigations, by his own study equally established the antagonistic action of these two muscles. These data were, nevertheless, not established with sufficient accuracy, and it is to Politzer (*c*) that we owe the first experimental demonstration. We owe to him not only the demonstration of many physiological ideas, but above all, the creation of a new method of research respecting the ear, a method which has since been followed by all those who have given themselves up to studies of this kind.

M. Duplay (*d*) has given us a *resumé* of them, and we will confine ourselves to recalling certain essential points, much disputed at the time, which Politzer firmly established. Thus, he shows that, 1, when the internal muscle of the malleus contracts it does not produce rotation of the malleus on its long axis; 2, the malleus is drawn inward in all that part which is below the insertion of the tendon of the muscle, whilst the part above that insertion swings outwards; 3, at the same time, there is produced a movement inwards of the whole membrana tympani, and, consequently, of the malleus; 4, during this time there is produced a slight rotation of the malleus on its long axis, but in an opposite direction to that generally believed—that is to say, its anterior surface is turned slightly backwards; 5, there is produced a tension of the whole membrane, and not only of one of its parts; 6, with respect to the influence of the tension of the membrane on the perception of sounds, he has always observed, with low-toned tuning-forks, a diminution of the fundamental sound with the appearance of overtones—a phenomenon which is also produced by the tension of artificial membranes.

Soon after the celebrated experiments of Politzer, Helmholtz (*e*) published his theory of hearing, which is now generally accepted; but before touching upon this, we must return to some anatomical considerations which will enable us better to comprehend the action of the accommodating apparatus of the ear.

The axis of rotation of the malleus is formed by the two ligaments, anterior and posterior, always moderately tense. The lateral ligaments are directed from within outwards towards the bony tympanic ring; they are short, and as they emerge above the axis of the malleus, from the point of the posterior tympanic spine, they prevent too great rotation of the head of the bone from without inwards, and of the axis from within outwards on the membrane. Section of the internal muscle of the malleus slightly diminished their tension, but the malleus always remains in its place; the slightest traction on the muscle greatly increases their tension, as would a very small force acting on the middle of a tense cord. The superior ligament which fixes the head of the malleus, has for its object the preventing of any movement which should draw the ligamentous axis downwards. The internal muscle of the malleus, which is inserted at the superior part of the handle of the malleus, constitutes an elastic band which, under the influence of nervous force,

(*d*) *Archives Générales de Médicine.* 1860. P. 341.
(*e*) "Annales du Congrès des Naturalistes de Heidelberg." July, 1867.

may be much stretched. It draws the handle of the malleus from without inwards, and this in its turn draws upon the membrana tympani. But since its attachment is very near to, and below the, ligamentous axis, it is especially on the ligaments that it exercises its action, and it augments their tension by drawing them a little from without inwards, a tension which always exists from the natural elasticity of the muscle, but which may be considerably increased by its contraction, feeble though it be.

The articulation of the malleus with the incus presents a curved irregular surface, resembling on the incus a saddle on which the head of the malleus is seated. Helmholtz compares its action to that of a cogged watch-key (tipsy key), which will turn easily in one direction, but has no movement in the other. When the handle of the malleus is drawn inwards its articular surface is pressed strongly into the head of the incus and held there as if in a vice, so that the articulation is very close ; when, on the contrary, the handle is drawn outwards the articulation is relaxed, and the articular surfaces separated, for the incus is not drawn upon, and does not follow the malleus. It results from this, that only an exaggerated movement of the handle of the malleus or of the membrana tympani outwards can have the effect of withdrawing the stapes from the fenestra ovalis. Thus, the disposition is such that when the internal muscle of the malleus contracts, it forcibly stretches the whole ligamentous apparatus which maintains the different parts of the ossicular chain close together, and firmly united one to another. The membrana tympani, the chain of ossicles, and the fenestra ovalis have for their function the transmission to the labyrinth of the vibrations which are brought to them by the external air. The membrana tympani receives vibrations of little strength with an extent of vibration relatively great. To be transmitted to the labyrinth, whose denser fluid requires a greater force to put it in motion, it is necessary that the vibration acquires greater force; on the other hand, the microscopical dimensions of the nervous expansions in the labyrinthine fluid require only vibrations of small size. The problem consists, then, in transforming vibrations of little force but great extent into vibrations of considerable force but small extent.

Now, the membrana tympani is from fifteen to twenty times larger than the fenestra ovalis ; the vibrations which it receives must then be transmitted to the latter with a correspondingly greater amount of force and less amount of extent. Politzer had seen that the vibrations of the malleus were more extensive than those of the incus, and the latter than those of the stapes. Schiedekam (*a*) and Buck (*b*) have established the fact with great precision ; the latter using the method of Lissajous, was able, with the aid of a micrometer, to measure exactly the relative dimensions of the vibrations of the ossicles. He found thus that the oscillations of the malleus had twice the extent of those of the incus, and four times that of those of the stapes. It results from these demonstrations that the apparatus of transmission plays the part of an extinguisher, and makes the labyrinth to a certain extent a defence against the too violent shocks which the membrana tympani may receive. These shocks are often sufficient to cause rupture of this membrane without producing any lesion of the fenestra ovalis. But this apparatus also strengthens certain sounds according to Helmholtz ; and Schiedekam and Hensen have observed that certain sounds of the siren resounded with an intensity quite peculiar to their ear. There results from this function of the apparatus of transmission that an alteration in this apparatus must have a greater influence on the hearing when the lesion is situated in a part nearer to the labyrinth. Politzer has demonstrated this experimentally. Examining the vibrations of the ossicles by Lissajon's process, he observed that, on pressing the membrana tympani with a small twig or a little ball of wax, its vibrations were vere very little modified, but if the same obstacle was brought to bear on one of the ossicles the vibrating power of the chain was notably diminished.

Pathology confirms the fact, and all otologists know well that considerable lesions of the membrana tympani, such as perforations, cicatrices, and calcareous deposits, influence the hearing much less than alterations in the chain of ossicles or the fenestra ovalis, such as adhesions and anchyloses. In both cases high tones are generally better heard than low tones ; what is most affected is the hearing of the human voice. The sounds of the human voice are, in fact, very complicated, more even than those of a piece of music executed by a large orchestra. They do not produce periodical vibrations like musical sounds, but form a mixture of noises and musical sounds, whose transmission to the labyrinth is very complicated. Politzer, who has endeavoured to study the vibrations of the chain of ossicles under the influence of the human voice, has observed that the ossicles present as many vibrations as there are vowels in the word spoken, and that the vibrations produced by the pronunciation of consonants are extremely feeble compared to those of vowels.

## A CASE OF DIPHTHERIA IN WHICH THE PULSE WAS DICROTIC. (*a*)

By Dr. HERMANN LÖWI,
of Vienna.

THE quality or character of the pulse undoubtedly plays an important *rôle* in severe febrile disorders. As, in this class of disease, the frequency of the pulse chiefly depends upon, and I may say corresponds to, the temperature of the body, so the character of the pulse is influenced by the increased or diminished action of the heart. So long as this action is strong, the arterial blood pressure will be considerable, but when it is weak, the pulse becomes small, weak, often thready, and sometimes imperceptible. Moreover, through a relaxed or paralysed state of the muscular coat of the arteries, the pulse may be soft, easily compressible, and *dicrotic*. At every pulsation the finger feels that there are two beats instead of one, the first of which is stronger than the second. This phenomenon has not been precisely accounted for, although it is well known that this duplication of the pulse-beat does not correspond to two but to one contraction of the ventricles of the heart. In abdominal typhus (typhoid fever) this symptom is of frequent occurrence, while it is rarely observed in exanthematous typhus (typhus fever). In diphtheria the dicrotic pulse has, as far as I know, never been observed, and, therefore, I take the opportunity of recording this case, not so much to justify the priority of my observations, as to draw the attention of my colleagues to a fact which probably occurs more frequently than they are aware of.

Franz Hansdorf, 26 Nordbahnstrasse, Vienna, a little delicate boy, æt. 6, and who, about the same time last year, made a good recovery from an attack of scarlet fever, followed by Bright's disease, suffered on the 22nd of November from slight febrile symptoms. After the disease had lasted two days, in the form of an ordinary sore throat, a slight deposit, like that of a little mildew, was discovered at the back part of the left tonsil. In the evening of the same day the whole tonsil was much swollen and covered with a thick wash-leather-looking membrane. The glands of the neck were very slightly swollen ; there was much headache ; the temperature was 40 C. ; and the pulse, 140.

(*a*) From the *Allg. Weiner Medizinische Zeitung*.

25th.—Early in the morning the right tonsil was likewise affected, and covered with a thick yellowish membrane. Uvula still free. Temperature more moderate; pulse, 120. In the evening a part of the uvula had a mother-of-pearl-like coating. The temperature higher; pulse, 140.

26th.—In the morning the whole uvula and a considerable portion of the hard palate were covered with the diphtheritic exudations. In the evening the boy was very weak, apathetic, and scarcely able to speak.

27th.—All the inside of the mouth, including the posterior wall of the pharynx, is covered with the membrane. Fever severe, great restlessness, and great difficulty of breathing. Tracheotomy not resorted to on account of the uncertainty of the result.

28th.—The child more restless; less difficulty of breathing. Pulse, small, weak—distinctly *duplicated* or *dicrotic*. The diphtheritic membrane begins to shrivel, a portion of it becomes detached, and, hanging down in the cavity of the mouth, causes a strong inclination to vomit. Evening—nearly half the membrane is separated and expectorated. Pulse, dicrotic.

29th.—Pulse, dicrotic. The exudation on the left tonsil is loosened. Temperature has fallen, and pulse slower. Thus, the dicrotic pulse has been observed for two whole days.

30th.—The debility continues in spite of stimulants and restoratives, and although by the 4th of December the membrane had become wholly detached, the child died on the same day from paralysis of the heart.

On the morning of the above date I had an interview with Dr. Klein, who had seen the child in my absence. While I was speaking to him about the dicrotic pulse, he said that, much to his astonishment, he had on the previous evening made the same observation, and that had we not accidentally met, he would have made a point of seeing me respecting it.

# Transactions of Societies.

## SURGICAL SOCIETY OF IRELAND.

SESSION 1878-79.

FRIDAY, JANUARY 3RD.

THE Society met at the Royal College of Surgeons, Mr. WILLIAM COLLES, senior member of Council of the Society present, in the Chair.

Mr. B. WILLS RICHARDSON, hon. sec., read the minutes of the proceedings of the previous meeting.

### RESECTION OF THE ELBOW-JOINT.

Mr. WILLIAM STOKES—The specimens produced are the result of resection of the elbow-joint which I performed last Monday in the case of a gentleman, æt. 26, of delicate appearance, dark complexion, and badly nourished. He has been suffering about two years with pain in the right elbow-joint, and latterly with swelling. It appears that he never received injury of any sort, but commenced to suffer from inability to flex and extend the arm two years ago; and it remained in a quiescent state twelve months. He went to London, where he was some time under the care of Sir James Paget and other surgeons. On his return he came under my notice about three weeks ago. At that time the swelling was very great in the elbow. There was great atrophy, both of the muscles of the arm and fore-arm, and there was an unhealthy-looking ulcer over the inner condyle of the humerus, through which exuded semi-purulent fluid. The probe detected bare denuded bone. By the last surgeon he consulted he had been recommended to get the arm amputated; but disliking that that procedure should be adopted, he sought further advice. I could not see any reason why the operation of resection should not be performed. The operation was done; and here are the specimens which exhibit, in a remarkable way, examples of pulpy thickening of the synovial membrane, and very extensive ulceration of the cartilages of the joint. I was glad to observe there was no appreciable evidence of any osseous disease. The extent of disease in the soft structures of the joint was so great as to preclude all hope of anything else being likely to be of service except the operation adopted. On both the humerus and ulna you see extensive ulceration of the cartilages. It is not so well-marked now, having been in spirits since Monday last, but still you can see sufficient to satisfy yourselves of it. I may mention that the case has gone on extremely well. The operation was done with rigid antiseptic measures adopted throughout, and the wound is almost entirely healed already.

### DILATATION OF THE FEMALE URETHRA.

Mr. WILLIAM STOKES—The next case is, I think, interesting in connection with the subject that is about to be brought under the notice of the Society by the Master of the Rotundo Hospital. It is the case of Catherine Clinton, æt. 35, at present under my care in the Richmond Hospital; she was admitted on the 13th of December last, complaining of pain in the hypogastric region, and also of shooting pains through the back. She produced some calculi which had come away with her urine. On the 14th she was operated on. I passed in a sound, and at once struck a foreign body and concluded we had to deal with a case of calculus, pure and simple. I then introduced a small urethral forceps, seized the foreign body, and removed some portions of the detritus (produced). On removing one of these portions of calculus I saw what led me to expect something more. On the surface of two of these there is a deep, well-defined groove, dark in colour, such as would be produced by the contact of an irregular body. On cross-examining her closely, she admitted the possibility of there being a foreign body in the bladder. She had been married for five months. Accordingly, on the 21st of the month, I dilated the urethra and, in the first instance, introduced a lithotrite, when I seized one end of this hairpin (produced). I had great difficulty in removing it, not being fortunate enough to catch it at the bent portion. Seizing the wire with the forceps, I then introduced my little finger, and placing it against the groove up where the wire is bent, and making strong traction at the end of the wire, I succeeded in straightening the hairpin and next in removing it. On a subsequent occasion I removed the remainder of these calculi which had collected on this foreign body. Mr. Tufnell asked me was there any difficulty in retaining the urine or any unpleasant consequence from the great dilatation. Nothing of the kind has occurred. I was struck by the great facility with which the urethra can be very largely dilated. We have heard of the great dilatation that Prof. Bigelow has adopted in cases of vesical calculus; but sufficient attention has not been drawn to the great facility with which the dilatation of the female urethra can be had. I introduced my index finger into the bladder, on the occasion noticed, with the greatest facility, and felt the foreign body quite distinctly.

Dr. ATTHILL read a paper on

### LARGE CALCULI IN THE FEMALE BLADDER,

which will be found at page 60.

Mr. THORNLEY STOKER—What size was the stone?

Dr. ATTHILL—The size of a walnut; but I forgot to measure it before Dr. Cruise cut it. It is right to say the question of extracting by any incision of the bladder was not entertained in the first instance. Having dilated the urethra so far, I deemed it better to remove it by that means than have recourse to a third operation.

Mr. T. STOKER—Some time since I removed a calculus from the female bladder; and perhaps the case is as instructive as that Dr. Atthill has laid before the Society, though differing in the details. The subject of my operation was a girl, 10 or 11 years of age; and the calculus was nearly an inch in its longest diameter, oval in shape, and proved to be extremely hard. I did not entertain the question of removing by a cutting operation. Being unable to dilate the urethra to admit of removing the calculus whole, I was obliged to break it up with a lithotrite, and remove it in pieces. The case is of interest as showing the extent to which the female urethra can be dilated, even in the immature condition of a girl of 11 years of age; because I was able to dilate it so as to admit of the introduction of my little finger. Considering the state of the parts in a child of such tender years, that dilatation was as considerable as was effected in the instance mentioned in an older patient.

Dr. M'CLINTOCK—It is to be regretted that the history of the case is not known to us—whether the retentive power of the bladder after the extreme dilatation of the urethra has

been completely restored. The general experience of surgeons of the effects of extreme dilatation of the urethra is, that the patient for a long time afterwards, if not permanently, has more or less want of control over the bladder. Taken together, or separately, the two cases brought before us to-night are very interesting, as tending to confirm the propriety and wisdom of a rule laid down by Sir Philip Crampton, in a paper he published on lithotomy, that lithotrity is very seldom applicable to cases of calculus in the female bladder. A very important question arises as to the proper mode of treating cases of calculus of unusual magnitude. For the purpose of extracting the stone through the urethra, Sir Philip Crampton recommended an instrument called the cutting dilator, which simultaneously with dilating the sides worked a blade that cut through the urethra next the pubis. It was thought that less injurious results would follow from incision of the urethra than any other mode. That instrument was also used by the late Mr. Cusack; and in one case by myself, assisted by Mr. Wilmot, in removing a very large calculus, 2¼ inches in circumference, from the bladder of a patient, curious to say, six months pregnant. She recovered from the operation, and after the full period was confined under my care. For a considerable time she could not retain urine two hours, unless perfectly quiet. If she attempted to walk about the urine would involuntarily escape from the bladder. The vesico-vaginal operation has also been performed with success. The two cases cited to-night are very interesting, as showing to what extent the urethra may be dilated without any permanent or great injury to the retaining power of the bladder. It is premature to draw any inference from Dr. Atthill's case, the patient passed from under his observation so soon; and it would, therefore, be interesting to know what the effect of the operation has been.

Mr. THORNLEY STOKER—I wish to add two remarks. One is, the dilatation in my case was performed in the course of a few minutes, the instrument I used being Ricord's three-pronged dilator, invented for dilating the female urethra. The other is that continence of urine was completely restored in four days.

Mr. M'NAMARA—An important question has been raised by Dr. M'Clintock as to the effect of the dilatation on continency of urine. For a long time I had an idea in accordance with the views of other surgeons, that dilatation of the urethra might have some effect on continence or on incontinence of urine. During the past few years extreme dilatation of the urethra in the female has, in a remarkable way, come under my observation, I allude to my examinations in the Lock Hospital. Not the vagina at all, but the urethra; and I have persistently inquired about the continence or the incontinence of urine. I fancy I could show Dr. M'Clintock three or four cases in the Lock Hospital where, without the slightest difficulty, he could introduce his little finger into the patients' bladder; and yet they keep their water in the most admirable manner. This is very striking. It is hard to know how the urethra has become dilated, but the fact remains that it is dilated—it is absolutely patulous, while they have perfect command over the bladder.

Dr. KIDD—It has been my lot to dilate the female urethra. I have used the instrument devised by Sir Philip Crampton—in fact, Sir Philip Crampton's own instrument in one case. I divided the sphincter up towards the pubis as he suggests. I was more fortunate than in Dr. M'Clintock's case. Perhaps I did not dilate the urethra to such an extent; but the patient recovered without any incontinence of urine. I have also assisted the late Dr. Sawyer in dilating the urethra with prepared sponge for the removal of a large phosphatic calculus, and we then broke down the calculus. In that case there was incontinence of urine for two or three days afterwards, but the patient fully recovered. Since then, I have never found it necessary to use a sponge or sea tangle, or other instrument for dilatation of the urethra. Christopher Heath published a paper describing a mode of dilating the urethra with the finger. His method was to put a probe in as a guide, and then to oil the finger well, and pass it alongside into the urethra. This I have done very frequently. By this means I have removed a stone nearly as large as that Dr. Atthill has removed. Pass the probe in first, oil your finger well, use first your little finger and then the index finger. After that, you can pass the ordinary lithotomy forceps into the bladder, and remove a stone of considerable size. I have done that four times, Mr. M'Namara being present on two of those occasions. On one occasion Mr. Porter and I had our finger in a lady's bladder eleven times. The stone broke, and the whole bladder was encrusted with a mortar-like deposit, and the only way we could remove it was by inserting the finger, and getting it out bit by bit. That lady never suffered from incontinence in the least degree. She has been occasionally under my observation since, and has never suffered the least inconvenience in the bladder. A short time before Christmas I saw a lady, æt. 75, who was suffering from stone in the bladder. I dilated the urethra, and had the advantage of Mr. Butcher's assistance. In the previous case I had given chloroform; in this we did not think it desirable. I passed two or three catheters of different sizes into the urethra, until I could get in my little finger, and then with an ordinary lithotomy forceps removed the stone, not a very large one, but one that gave her a great deal of irritation. In that case I was able to pass my finger in and feel it carefully round; and she never suffered any incontinency of urine. I believe we need not be afraid of dilating the urethra if we do it gently and quickly. It is better to do it at a single sitting than to spend time over it. Where chloroform can be used, or any anæsthetic, it renders the operation safer than without it; but in the case I have mentioned that was not necessary.

Mr. E. S. O'GRADY suggested a glove-stretcher for dilating, and mentioned that he had found it satisfactory in the case of a female, 75 years of age, who had incontinence for two or three days, and after that recovered complete power.

Mr. WM. STOKES—I forgot to mention as regards the question of continence, that there has not been incontinence for a single moment after the operation I performed. From the remarks of Dr. M'Clintock and Dr. Kidd, the question arises as to whether the cases where incontinence continues for a long time are not cases generally that have been dilated for a considerable period before the operation. It would appear from Dr. Kidd's experience, that after immediate dilatation no incontinence takes place, and the case I have mentioned bears that out, whereas the cases mentioned by Dr. M'Clintock and Mr. O'Grady, point to the liability to incontinence after prolonged instrumental dilatation. It is a question whether any prolonged dilatation should be resorted to, or dilatation immediately before the operation.

Dr. BARTON—In two cases I have used Weiss's dilator, and it appears to me to be superior to anything mentioned this evening. The three blades dilate perfectly simultaneously, and with all the advantage of sufficient rapidity while the patient is under ether or chloroform. Within five minutes, using gradual dilatation, we have the female urethra dilated to allow of the introduction of the index finger. My experience endorses Dr. Kidd's as to the retention of urine. In the last case the patient came in for calculus in the bladder; but upon physical examination, I could not find any. I introduced Weiss's dilator, the subject being under ether, and in five minutes the urethra was large enough for the introduction of my index finger fully and freely. There was no difficulty of retention of water at all. In a like case in which a similar operation took place, the water ran away for twenty-four hours to some extent, and after that the patient had full control.

Mr. HAMILTON thought the little finger more manageable than any instrument, and created less pain. He added that Mr. Fleming had often used a glove-stretcher, as suggested by Mr. O'Grady.

Mr. WHEELER—When I was a student I had an opportunity of assisting the late Prof. Geoghegan in extracting a calculus from an old lady. He dilated the urethra with prepared sponge, and not finding the dilatation sufficient, he took a probe-pointed bistoury, passed it in on his finger, and cut the sphincter upwards towards the pubis, and then extracted the stone without much difficulty. There was incontinence of urine for three weeks, and after five weeks it ceased, and she was able to retain her urine as well as before the operation. With regard to the dilatation of the urethra in cases of suspected stone or disease, though the experience of this meeting does not confirm that it will cause incontinence of urine, still I can scarcely think it is justifiable when we have the endoscope, which there is no difficulty in using in the female bladder. I have demonstrated small ulcers in the female bladder with this instrument, as Mr. Tufnell will remember, and removed a portion of gum elastic cathether from the bladder of a female patient by passing a small lithotrite and seizing it, having diagnosed the existence of the catheter first by the endoscope. American surgeons recommend that the bladder be given perfect rest by making a vesico-vaginal operation, and letting the water continually drain off. In the condition of bladder of Dr. Atthill's patient, such a course

might have been advisable, and the stone have been extracted through the vagina.

Dr. BARTON said the dilatation he had mentioned had an admirable effect—it cured the frequency of micturition which existed.

Dr. ATTHILL replied. He said—Every speaker, save one, has endorsed the justifiability of dilating the urethra, which is the only question almost arising. There is a difference of opinion as to rapid dilatation and comparatively slow dilatation. In this case, it was better to do it slowly, and for two reasons—first and mainly, the patient was in a delicate state of health, suffering from disease of the bladder, or at least, irritation caused by the stone for a great number of years; and, secondly, there was liability to rupture the fibres of the urethra, which must be unhealthy. Rapid dilatation of the uterus is dangerous; and having this experience, I determined to distend slowly, so as not to risk rupture. The result justifies that I was right. Dealing with a healthy urethra, where you dilate rapidly it retracts rapidly. As to the power of retaining the urine subsequently, in the case alluded to in my paper, she stayed under my care only fifteen days. At that time she was able to retain urine between two and three hours. She had had incontinence of urine for years. The bladder itself was so unhealthy she could not bear to retain water if she had the power. Therefore she could not be a satisfactory test case.

## FIRST OPHTHALMOLOGICAL SOCIETY OF HEIDELBERG.

### TENTH SESSION.

*Extract from the "Klinische Monatsblattern für Augentreil Kunde."*

Translated from the "*Annuales d'Oculistique.*"

By ARCHIBALD HAMILTON JACOB, M.D. Dub., F.R.C.S.I,

Sometime Ophthalmic and Aural Surgeon to the City of Dublin Hospital, and Dublin Eye and Ear Infirmary.

(*Concluded from page 45.*)

SECOND MEETING OF THE 19TH OF AUGUST.

President—PROFESSOR SCHWEGGER.

X.—ENGELHART.—*Fluoresence of the Living Retina* (pp. 134—140).—To demonstrate this effect the author has collected the luminous rays, on their exit from the prism on the mirror of the ophthalmoscope in such a manner as to project a small spectrum on the retina. The effect is surprising; on the back of the eye the spectrum appears as usual, but as regards the vessels there is a notable difference in the red; they are intensely red; in the orange scarcely visible, in the green inky black, in the blue of a brown-yellow colour, and in the violet of a deep red-brown.

These variations of colour are so clearly marked, that the vessels present the appearance of having been cut across at certain places. The black tint in the green rays is produced by absorption.

In the blue and in the violet the colours can only be accounted for by the fluoresence of the retina lying behind the vessels. This explanation is certainly the true one, as has been proved by experiments in which capillary tubes, filled with blood, on an artificial background, were employed. These experiments have been repeated by means of lenses and of prisms in quarters and of the solar light.

XI.—M. LITTEN.—*On Changes in the Retina during Malignant and Acute Endocarditis, and in other Septic Diseases* (pp. 140—143) (read by Hirschberg). Nine cases observed; of these eight were cases of women in a puerperal condition, the other being the case of a man suffering from severe diphtheria of the large intestine. In all these cases there was hæmorrhage of the retina, generally in both eyes, differing, however, both in form and in extent. This hæmorrhage occurred only at from 50 to 60 hours before the death of the patient. In two cases there was, further, more or less advanced metastatic ophthalmia.

XII.—DONDERS.—*On a Pancratic Glass.*—This most important communication will be published *in extenso* in a future number.

XIII.—O. BECKER.—*Ophthalmoscopic Visibility of Visual Violet.*—It being granted that the red colour of the retina does not depend on visual red alone, the next step is, to discover to what extent this latter contributes to it, and consequently if it can by any means be made visible in the ophthalmoscope. The horizontal red ray discovered by Kühne, in the rabbit, is not visible in the ophthalmoscope. If an optogram be produced in the living human eye, nothing can be perceived; repeating the experiment of Kühne on both eyes of a rabbit, the optogram cannot be perceived in the ophthalmoscope, although its existence, after the section, in an eye which has been subjected to ophthalmoscopic examination can be proved. The author has then endeavoured to see the visual red without a background of red behind the retina. For this purpose he practised an opening in the sclerotic, and abstracted the choroid. The eye thus prepared, is placed in a white capsule, which is then covered with a diaphragm. In the ophthalmoscope the opening, if the preparation has been rapid, presents a reddish appearance, particularly at the edges, this colouring pales gradually, and, in the eye of the calf, it takes a yellow tinge, proof that it is not the capillaries which impart this colouring to the opening. As to the pallor observed in the retina after death, it is due to the efflux of the blood from the arteries, and this pallor exists even when the visual violet can still be observed.

*Discussion.*

Donders has seen two pairs of human eyes from which all light had been carefully excluded, and which had been preserved in a solution of alum. The retina was of a brown-yellow colour, quite different from the pallor usually observed. This brown failed near the ora serrata over an extent of from two to five minims. As to the macula, it is possible that in it a colourless substance takes the place of the visual violet.

Hörner has found it necessary to enucleate relatively healthy eyes, which he had purposely kept bandaged during several days. Immediately after enucleation, which was performed as rapidly as possible, the eye was separated into two parts, the retina being examined from within. The neighbourhood of the macula was found to be of a bright maximum red; this colour, however, quickly disappeared; the macula at first showed itself in the form of a grey spot. In proportion as this redness diminished, the choroid became visible; in its turn, becoming indistinct when the neighbourhood of the macula took a yellow shade. It may be that the macula was originally red, but that this colour was extremely unstable, and had already been destroyed during the death struggle. Fuchs has observed in a case of recent detachment of the retina, a border of violet which had also been observed by several of his colleagues. As this was at a time when the visual violet had not yet become known, he could not have had any preconceived idea concerning it; the phenomena of interference might however possibly solve the question.

XIV.—FÖRSTER.—*Mensuration of the Field of Vision in Anæsthesia of the Retina* (pp. 162—168).—The concentric contraction of the field of vision which is pathognomonic of this affection is difficult to measure. The author has examined seven patients very frequently (on more than 120 occasions). The result obtained—firstly, that the field of vision frequently varies in a few hours; secondly, that fatigue diminishes the extent of the field of vision; thirdly, that the object is more peripherically perceived at the entrance than at the exit of the meridian, provided always that the patient be allowed to rest between such examinations. This also occurs if the patient look at a red object. The field of vision is diminished by the influence of atropine. It is not enlarged by *eserine*. As a therapeutic, an injection of strychnine had a powerful effect in four cases, but in the other three it had no effect, not even an unfavourable one.

*Discussion.*

In answer to the objection that simulation is both frequent and difficult to discover, Förster answered, that he has taken it into consideration, but, that it is scarcely possible to admit that it occurs, when the results are the same, and accord so well in different patients. He has not em-

ployed blue glasses for the purpose of observing if they have any influence on the field of vision.

XV.—Stilling.—*Method of Examining the Sensation of Colours* (pp. 168—174).—The author has arranged pictures, which facilitate to a great extent the examination of colour-blindness to the colours red and green, and yellow and blue. It may be stated that, in all affections which concern the optic nerve, acuteness of vision is affected in a very different manner for different colours, which is not the case in other affections of the eye. This difference may even, in certain cases, be applied to the differential diagnostic.

XVI.—Berlin.—*On Traumatic Astigmatism of the Lens* (pp. 174—178).—The observations on temporary derangement of the retina after traumatism, have been confirmed by several ophthalmologists; some, however, do not admit the explanation given by derangement of visual acuteness, but attribute it rather to retinal derangement.

The key-note of this explanation, is the fact, that visual derangement does not correspond with the extent of the derangement of the retina.

In seven cases out of twenty-one, the visual acuteness could not be determined, on account of hæmorrhage or of derangement of the cornea. In fourteen other cases, thirteen were temporarily myopics, ten between 1-30th and 1-9th; there was astigmatism in six cases, but this might possibly arise from an irregular cramp of the ciliary muscle. The hæmorrhage observed while experimenting under the ciliary muscle of rabbits, might produce an irregular curvature of one surface of the crystalline.

*Discussion.*

Schröder reported a case of cyst of the iris, accompanied by astigmatism; eight days after the excision of the cyst, the astigmatism had disappeared.

XVII.—Schön.—*Refraction of Rays falling on the side of the Lens.*—From the measurements of eight eyes of the ox, and of six of the pig, it results, that the lens is not completely astigmatic, but also, that the astigmatism is not entirely corrected. According to a calculation made, on a parellel ray having an inclination of 60°, in order to observe the influence of accommodation for this inclination, the result would be, that the clearness of the image does not vary greatly, whether the eye be accommodated to infinity or to the *punctum proximum*..

XVIII.—Welz.—*On Linear Extraction, Iridectomy having been practised previously.*—For five years the author has practised iridectomy some weeks before the operation; he has not lost a single eye by extraction. He does not, however, take it for granted that he will always be equally successful, but merely recommends this method.

Meeting for the Arrangement of Business Matters.

The Directing Committee was re-elected, and is composed of MM. Arlt, O. Becker, Critchett, Donders, Förster, Hess, Hörner, and Zehender. As judges for the Welz prize, M.M. Leber, Manz, and Knapp were elected, to whom were added MM. O. Becker and Förster, members of the Committee.

The Session for 1879 will commence on the 11th of August.

---

Official telegrams received from Astrachan announce that the sanitary state of the district has improved. In six villages all those who were attacked by the black plague have died, but since then no more cases have occurred there. At present all attention is concentrated upon the village of Wetlianka, in order to put an end to the epidemic, the contagious and fatal character of which has been established beyond all doubt. In Germany, fears are entertained that the plague may cross the borders in the spring.

---

In response to an application by the Committee of Management of the Queen's Hospital, Birmingham, the Chairman has received a cheque for 100 guineas from Her Majesty the Queen, as a donation to the fund for liquidating the debt of the institution.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 22, 1879.

## ADULTERATION OF FLOUR AND BREAD.

The case which Dr. Sedgwick Saunders, the Medical Officer of Health for the City, recently brought before the Commissioners of Sewers, shows the alarming extent to which some dishonest tradesmen have the audacity to carry the adulteration of food. But we are sorry to add that the circumstances to which we now refer, and which have been fully reported in the daily papers, also show how imperfect is the machinery by means of which we endeavour to check such fraudulent practices as are prejudicial to the public health. It further appears that the gigantic nature of these frauds is quite on a par with those other commercial frauds with which the public have lately been too painfully familiar.

From information he received, Dr. Saunders made a chemical and microscopical analysis of some samples of a material that had been imported in large quantities as "meal," and some of which had been actually sold to a baker and made into loaves. Five grammes of this stuff were incinerated in a platinum crucible at white heat for four hours, and yielded an ash equivalent to 78·94 per cent. of its original weight. The usual quantity of ash of pure wheaten flour varies from 8·7 to 0·8 per cent., and rarely exceeds 1 per cent. Thus, a sample of good flour submitted to analysis on the same day and in the same manner, yielded only 0·82 per cent. of ash. But what is still more surprising, a chemical examination of this ash proved it to consist of sulphate of lime, the carbonate of the earth with which flour is sometimes adulterated being absent. Moreover, on a microscopical examination, this flour was found to contain a large quantity of crystals which corres-

ponded with those observed in crystalline sulphate of lime, and which were identical in appearance with some commercial plaster-of-paris obtained from a builder. In fact, so large was the quantity of lime in this so-called flour, that Dr. Saunders was able to use it as a plastic material, and to have made from it a model of a donkey's head, which, amid great laughter, was shown to the Commissioners.

The reader will naturally suppose that such a colossal and dangerous example of adulteration would have been dealt with in a very summary manner; and that if, in the interest of the public health, a small tradesman is heavily fined for adulterating his butter or his beer, such a wholesale tampering with the staff of life would be punished with the utmost rigour of the law. But not so: for the Medical Officer of Health had, up to the period of the meeting above-mentioned, been completely thwarted, and had been subjected to a good deal of personal annoyance, in his attempt to stop the sale of this spurious flour. There were no fewer than 79 sacks of the "meal" lying at the Custom House and Wool Quay, in Lower Thames Street; and when, in accordance with the Nuisances Removal Act, 1863, Dr. Saunders applied to the Lord Mayor to have the flour condemned and destroyed, his application was refused. What would have happened had all these sacks of lime been made up into loaves, and distributed amongst the poor, may be easily imagined. Probably, the shameful extent of the adulteration would have made the bread so unpalatable as to render it unsaleable, and would thus have defeated the nefarious object which its vendors had in view. Probably, also, the serious consequences which would have resulted from eating this trash would lead to the detection of the fraud, but not until much mischief had been done, and many had suffered from, or even fallen victims to, the bowel complaints which such food would undoubtedly have produced. As Alderman Sir Robert Carden justly observed, the case of adulterated flour closely resembled a case of diseased meat. Magistrates, upon diseased meat being certified as unfit for human food, ordered its destruction. In this case the flour should have been condemned, and it was a "monstrous" thing that this flour should, in consequence of the Lord Mayor's decision, remain to be circulated during the time that a prosecution was instituted. It is, moreover, evident that, whether the judgment of the Lord Mayor was right or wrong, some amendment of the Act of 1863 might be reasonably contemplated. If his decision was a legal one, then a more prompt method of dealing with these frauds is most desirable. If, as we think, his judgment was not in accordance with the provisions of the Act, then the Medical Officer of Health and the Public Analyst, who are the best judges as to whether adulterated food is, or is not, injurious to the public health, should be invested with more summary powers, and enabled to act independently of local magistrates.

The public are certainly justified in assuming from the above disclosures that they run the risk of eating unwholesome bread more frequently than is generally supposed. It has been long known that, besides such harmless impurities as flour from beans, peas, maize, rye, potatoes, &c., wheaten flour is often adulterated with such mineral ingredients as alum, sulphate of lime, carbonate of lime, carbonate of magnesia, and bone-dust, while the most objectionable and most common impurity in household bread is the alum which is so generally used by bakers to give an artificial whiteness to the bread that is made with the inferior kinds of flour. When we consider the remarkably astringent properties of alum, we can easily conceive the injurious effects which the habitual use of even very small quantities of this salt must have upon some constitutions, especially upon those people who are naturally of a constipated habit of body. The prevalence of constipation amongst all classes of society is much greater than even members of the profession are aware of, and perhaps can only be duly estimated by taking into consideration the enormous amount of aperient pills that are consumed by the public, and the large fortunes that have been made out of the sale of patent medicines of this kind. No doubt the wide prevalence of this symptom is in a great measure due to the sedentary habits and mental work or anxieties incidental to civilised life, but it is our firm conviction that it is often aggravated by the habitual use of bread adulterated with alum and other mineral impurities. We have known many instances in which persons who have been long troubled with constipated bowels in spite of all kinds of remedies taken for their relief, have got quite well by giving up white baker's bread, and by eating brown, or the whole-meal bread in place of it. Considering that the contingencies and exactions of modern life predispose to a symptom that is either greatly neglected or empirically treated, too much importance cannot be attached to the character and purity of such a common and essential article of diet as bread The attention of the busy practitioner is, we are afraid, too often diverted from the possible evils resulting from eating adulterated food by other conditions that are more readily discovered. The public may therefore congratulate themselves upon the fact that what may escape the notice of the physician may be found out by the public analyst or the Medical Officer of Health, and that their health is not likely to be seriously jeopardised while we have amongst us such able and zealous sanitarians as Dr. Saunders has shown himself to be by his conduct in this case.

## CHRONIC INTERMITTENT ALBUMINURIA.

NEXT to *Treatment*, we hold that *Prognosis* is the most important department of practical medicine. Indeed, we might truly say that in many respects it is without exception the most valuable part of medical science. Its supreme importance lies in the fact that, not only is prognostics in medicine, as in astronomy and other sciences, one criterion of the degree of perfection to which that science has reached, but that it is a species of knowledge with which as regards the universality of its application, treatment can bear no comparison. In the thousands and tens of thousands of cases in which treatment has been useless, and even worse than useless, there has not been one case in which prognosis has not been able to justify its claim upon the attention of the profession. Where we cannot cure, we can promise a return to health. What our art cannot do, we can promise that Nature will do for us. Where all hopes of recovery have vanished, we may still gauge the amount of mischief that has been done, or measure the

time the patient has to live. They were, therefore, wise, those ancients, who devoted so much of their attention to the study of this department of medicine, while we in our generation have greatly erred in having comparatively neglected it.

For these reasons we need not make any apology for leaving for a while the well-beaten track of medical politics to travel over ground in which, though much is known, yet much remains to be discovered. In the last issue of "Guy's Hospital Reports" there is a paper by Dr. Moxon, the well-known physician to that charity, to which, from a prognostic point of view, much value should be attached. Among the many mistakes to which we are all liable in the practice of our profession, there is none more common or more serious than that of forming a wrong estimate of the value of a single symptom. The correctness of our diagnosis, and consequently the efficacy of our treatment and the propriety of our prognosis, will all depend upon the right or wrong interpretation we put upon one prominent symptom. In the list of single symptoms whose proper value is more correctly appreciated now than formerly, we may give albuminuria a foremost place, both on account of the frequency with which it is met, the grave disorders with which it is often associated, and the unjustifiable alarm to which it not infrequently gives rise. There was a time when the significance of albuminuria was, especially from a prognostic point of view, over-estimated, when, in fact, it was too often looked upon as a symptom of irreparable disease of the kidney. After a while, however, it was discovered that an albuminous state of the urine was often a transitory and a by no means ominous symptom, and that it was often associated with disease that was either trifling or not necessarily fatal. It was found to be present in the course of many acute inflammatory and febrile affections, in the exanthemata, in rheumatic fever, in typhus and typhoid fevers, in ague, in pyæmia, in pneumonia, in obstructive disease of the heart and lungs, in diphtheria, in pregnancy, in purpura and scurvy, and even after errors of diet and attacks of indigestion. Hence albuminuria began to be distinguished into that which is associated with Bright's disease of the kidney, and that which is but a temporary accompaniment of various curable diseases—that in which there is an unnatural excretion of albumen which is proper to the blood, and that in which there is natural excretion of albumen which is foreign to the blood. As Dr. Moxon well observes: "There is albumen and albumen; some albumen differs from other albumen in the tendency it shows to escape from the renal vessels after the manner of a thing excreted as unsuitable. And hence arose the recognition of a certain incompleteness in the production of peptones, or albuminous products of digestion, so that abortive kinds of albumen may be formed in incomplete digestion, those abortive albumens filtering off through the kidneys, and giving rise to albuminuria, which would be no sign of renal disease, but only a result of dyspepsia."

The object, however, which Dr. Moxon had in view was to report a group of cases in which there will be found certain points as yet unrecorded, and which in our opinion cannot fail to interest and instruct the busy practitioner. He divides his cases into two classes. In the first kind of cases, which is called the *Albuminuria of Adolescents*, the albuminuria is intermittent, continues over a long period in a desultory and irregular manner, and ultimately ends in recovery.

In the other kind of cases (*remittent albuminuria*) the albumen is present in greater quantity, occurs more constantly from day to day, especially after breakfast, is seldom passed in the early morning, and is sometimes connected with Bright's disease, and sometimes not. The albuminuria of adolescents, to the consideration of which the present paper is confined, occurs chiefly in young men, who are observed to be "out of condition," and to be listless, languid, easily fatigued, sleepy during the day, dark and sunken about the eyes, while they may themselves complain of headache, of rising unrefreshed from sleep, and of being indisposed to avail themselves of cheerful company. Nevertheless, an examination of the body gives negative results; and their case may be regarded as one of general debility, especially as one examination of the urine is not sufficient to establish the presence of albumen. In specimens, however, of all the urine of two days, some of them will be certainly albuminous, and this generally in the urine passed after breakfast. If these cases, observes Dr. Moxon, went on into a state of established renal disease, and did not recover, they might be, as Dr. Dickinson is inclined to believe, the initial stages of "granular kidney;" but many of them have so completely recovered that there is reason to believe them to be a temporary disorder peculiar to the adolescent period of life. This view receives strong support from an observation which Sir W. Gull made in a letter he wrote to Dr. Moxon. "I have," says Sir W. Gull, "so often found albumen in young men from the age of sixteen to twenty-two, that I regard it as common, and I have attributed it to atony of vessels and nerves. I remember that when Dr. George Johnson brought forward 200 instances of albuminuria, I asked what worth the mere statistics of albuminuria had, since it occurred in young men and boys almost as frequently as spermatorrhœa." The cases which Dr. Moxon has cited in "Guy's Hospital Reports," and which form but a part of those he has observed, bear out the general description which he has given of the disorder; but it is a rather important and significant fact that in most of these cases the urine deposited a large number of crystals of oxalate of lime. Dr. Moxon refrains from discussing the pathology of these cases, but he thinks, and in our opinion very justly so, that this morbid condition of the urine may irritate the kidneys, or, at all events, have something to do with the excretion of albumen.

It is, therefore, a fact that the symptom of albuminuria is of itself of little weight in determining the presence or not of renal disease, and, consequently, in framing our prognosis of such cases. But we would remind the reader that albumen is not the only morbid urinary deposit which, notwithstanding its apparent gravity, may occur independently of any serious disease. There are cases in which a large amount of sugar is temporarily excreted by the urine, giving rise to the impression that the patient is suffering from an attack of diabetes, from which there is no hope of recovery. There are cases in which an enormous amount of *phosphates* are deposited, or rather, to the great alarm of the patient, are seen to come away with the urine, so that the patient, who is perhaps very hypochondriacal, supposes

that he is suffering from some irreparable disease of the nervous system, when his stomach and liver are alone at fault. Even in the paper to which we are drawing attention Dr. Moxon says that he has a gentleman under his care for a kind of weakness connected with an entirely different, but quite definite morbid state of the urine—viz., the presence of great excess of urea, so that the gravity runs 1028-1033, and nitrate of urea forms crystals when nitric acid runs down the side to lodge under the urine in the ordinary mode of testing. These facts, therefore, show the necessity of making a thorough examination of the patient, and a careful inquiry into all the history and circumstances of his case, whenever we are tempted to attach too much importance to a single and prominent symptom; but with regard to albuminuria, it should be borne in mind that the very frequency of its occurrence in connection with other affections than those of the kidney, or even from trivial causes, makes us all the more liable to overlook the gravity of those cases in which it is really an initial symptom of kidney disease, and all the more incumbent upon physicians to show by such observations as Dr. Moxon has published how we are to distinguish those forms of albuminuria which presage serious disorder of the health, from those in which the prognosis is more hopeful. Much might be done in this direction by individual practitioners, especially those who, practising in the country, have the opportunity of keeping their patients long under observation. In the meantime we must thank Dr. Moxon for drawing our attention to these cases of albuminuria, and trust that before long he will favour us with further observations on the subject.

## THE HEALTH OF DUBLIN.

We have had to record from week to week for the last couple of months a steady increase in the mortality of the Dublin District. Last week the death-rate of the city (including the suburbs) has reached the appalling ratio of 50·6 per 1,000 of the population. In the week ending Jan. 11, for which the return now reaches us, the death-rate had fallen to 44·8; but in other respects there was no improvement in the sanitary condition of the Dublin District. The mortality for the week ending Jan. 4 showed an increase of 3 per 1,000 on the previous week. It exceeded that of Glasgow (29·4) by nearly 40 per cent., that of London (27·7) by 43 per cent., and exactly doubled that of Edinburgh (25·1). One hundred and twelve persons lost their lives within that one week over and above the average of those who died *in Dublin* in the same week of ten preceding years; in other words, nearly 160 lives were lost in excess of those which would have fallen in the same time in a city of average salubrity. One week later, though the death-rate had fallen to 44·8, it was still more than one-third above that of London (27·0), nearly double that of Edinburgh (23·2), and more than a third over that of Glasgow (28·1). The preceding table gives the sanitary condition of the principal cities, comparatively.

| Week ending | Death-rate per 1,000 of population. | Excess of Dublin Rate. | | | Lives lost over Average. |
|---|---|---|---|---|---|
| | | Above London. | Above Edinbro' | Above Glasgow. | |
| Jan. 4 | 50·6 | 22·9 | 24·9 | 21·2 | 112 |
| Jan. 11 | 44·8 | 17·8 | 21·6 | 16·7 | 84 |
| Average of two weeks | 47·7 | 20·3 | 23·2 | 18·9 | 98 |

The small-pox appears from returns to be again rapidly on the increase. The new admissions to hospital for that disease during the Jan. 4 week amounted to 72, which was higher (with one exception) than any week for several months past. Even that total was exceeded in the succeeding week (ending Jan. 11), when the new small-pox admissions were 95—the highest number, save one, in any week for several months past. Typhoid fever had also slightly increased, and measles were also becoming more prevalent.

The foregoing statement of facts, referable, not to one exceptional week, but to the health of the city for some months past and, in a greater or less degree, to the permanent condition of Dublin sanitation, should surely be enough to excite to action those even who have no special interest in the matter. Yet, we look in vain for any movement on the part of the Public Health Committee of the Corporation. So far as the papers inform us, all is lethargy, inaction, and *sang froid* in that body. We have, of course, the usual weekly report in which the Superintendent Medical Officer mades a feeble and somewhat ridiculous effort to make things pleasant by laying the 110 extra lives lost to the blame of the weather, and we have the usual record of prosecution of a dozen or two hopeless and helpless paupers for infringement of sanitary law. They, poor creatures, whom the Public Health Committee has nurtured for all their lives in the lap of stench and misery, and whom it now punishes for being what they always were. Of any work which may, even remotely, tend to improve the condition of affairs, we hear not a whisper, and we should not have known that such an organisation as the Public Health Committee existed but for the notoriety they have achieved by their contemplated job.

The time has, we really think, at last arrived when the citizens must take the matter in hand for themselves. What are they waiting for? Is there any grand scheme of sanitation incubating? Is there the dimmest glimmer of hope that the Public Health Committee will give itself any trouble about the matter? Has not the occasion arrived for a unanimous and influential memorial to the Local Government Board to assume the functions of the Committee and, in virtue of their legal powers, carry out those sanitary reforms which the Committee is helpless or unwilling to effect?

If, with a death-rate of 51 per 1,000, a weekly loss of over 300 lives in the city, and not the least hope of amendment under the existing system, the citizens need further stimulus to action, it seems likely that, before many weeks are over, they will have that stimulus in the former of a still more terrible death-roll.

# Notes on Current Topics.

## Mortality from Contagious Diseases—1878.

The Registrar-General having completed his statistics for the metropolis during the past year, thus sums up the results so far as the Metropolitan Asylums are concerned: 6,064 completed cases of small-pox, scarlet fever, enteric fever, and typhus were recorded in the several hospitals for infectious diseases under the management of the Asylums Board; these included 4,995 recoveries and 1,069 deaths, the average mortality being equal to 17·6 per cent. of the completed cases. The number of completed cases of small-pox were 4,762, among which the mortality was equal to 17·6 per cent. against 17·2 per cent. amongst the 7,242 completed cases recorded in these hospitals during 1877; in the Highgate Small-pox Hospital the proportional mortality among the 422 completed cases recorded last year did not exceed 14·2 per cent. In the Metropolitan Asylums Hospitals 503 completed cases of enteric fever were recorded last year, against 280 and 334 in 1876 and 1877; the mortality, however, which was equal to 20·0 and 24·0 per cent. in 1876 and 1877, declined to 18·0 in 1878. Among 398 scarlet fever cases recorded at the London Fever Hospital, the mortality was only 10·6 per cent. During the year 1878, the average number of small-pox, scarlet fever, enteric fever, and typhus patients under isolation and treatment in the Metropolitan Asylums Hospitals was 602, of whom 405 suffered from small-pox, 101 from scarlet fever, 80 from enteric fever, and 16 from typhus. It is satisfactory to note that the appreciation and use of these metropolitan infectious diseases hospitals is becoming more general. In 1876 the proportion of the total deaths from enteric fever in London occurring in these hospitals was 7·2 per cent., while it rose to 9·0 and 9·4 in 1877 and 1878; of the scarlet fever deaths in London only 3·7 and 3·5 per cent. occurred in these hospitals in 1876 and 1877, whereas the proportion rose to 5·0 per cent. in 1878.

## Amount of Solids in Milk.

As a contribution towards a solution of the question as to the minimum amount of solids in milk, the following, addressed by Dr. Cameron, of Dublin, to the *Analyst*, may be of some assistance:—

About two years ago a somewhat large number of specimens of milk were sent to me for analysis by the Corporation of Drogheda. Very few of them were of fair quality, some were of very doubtful composition, others were partly skimmed or were watered. Several of the vendors of the skimmed and watered milks were prosecuted and fined. A second batch of samples of milk was subsequently sent up, and exhibited a marked improvement—only one specimen was largely adulterated, and its vendor was prosecuted and fined. The result is that the milk sold in Drogheda during the present year appears to be perfectly free from adulteration. I shall not give full detail of analyses, but merely the average of the total solids in the twenty-six specimens sent from time to time in 1878—13·31. These twenty-six samples of milk were taken partly from the supplies brought into town by the country people and disposed of to the local dealers, partly from the milk of the local cowkeepers. The samples were taken without any previous warning, the inspector of food being put into motion by the borough surveyor. We may take it for certain then that the milk of the dairy cows in the neighbourhood of Drogheda contains on the average more than 13 per cent. of solids. The minimum amount in the twenty-six samples was 12·19, the maximum 14·79.

## The Proposed School of Pharmacy for Ireland.

At the last meeting of the Council of the Pharmaceutical Society of Ireland a report of the Education Committee was adopted to the following effect:—

1. That, considering the financial position of this Society, the Committee is of opinion that it would not be desirable for the Council to undertake the responsibility of a School of Pharmacy at present, however desirable that course might be at a future time.

2. That it would be most desirable that a certificate of having attended a practical course in chemistry be required from candidates presenting themselves for their pharmaceutical examination, and that certificates be received from the following schools only, viz.: Trinity College, Royal College of Surgeons, Carmichael College, the Queen's Colleges of Belfast, Cork, and Galway, and the Royal College of Science, and such other schools as shall be approved by the Council.

## Professional Humanity.

In the report of an inquest recently held at Newcastle upon the body of a woman who had died from drinking a liniment by mistake, we find the following evidence given by the woman's husband. "After she returned to bed, she said, 'Charlie, I believe I am done for. I think I have taken the liniment instead of my own medicine.' She seemed quite blue, and pointed to me to get her some help. I called in two of my neighbours, and then went for a doctor. I called on Dr. H., *but he would not come*, and then I tried Dr. B., *and he would not come*. He, however, recommended me to go to Dr. W. I went to Dr. W., *and he would not come*. He said I had better go and demand the doctor at the Police Station. I went there, and they telegraphed for a doctor, and a medical man came twenty minutes after the message was sent. When he arrived my wife was dead. I was at Dr. H's five minutes after my wife had taken the liniment, and then I went to Dr. B., and he asked me the nature of the liniment, but as I could not tell him he would not come. I distinctly told all the doctors that my wife had taken liniment, and I expected when they knew this they would have come at once, but none of them came."

It is no duty of ours to champion all the acts of medical men, and, in this instance, we unhesitatingly say that, presuming the evidence to be true, the practitioners therein referred to were guilty of cruel inhumanity, and a grave offence against every principle of compassion.

No doubt they were free of any legal obligation to attend the dying woman, and were, in the strict letter of the law, justified in passing on the case to the police doctor, but what they are stated to have done, would have

been unhesitatingly condemned if done by a civilian. Such evidence is liable to err, but, if it be accurate, we should advise our three brethren at Newcastle to apply themselves to the comparison of the Levite and the Samaritan.

## The Alkali Acts.

From the last reports of the inspector under these Acts, it would appear that the effects of acid gases on the health of vegetable and animal life is not so prejudicial as was first supposed. Not only is the value of land increased from its proximity to manufacturing industries, but the productive power of the soil does not appear to be injured by the emanations from the alkali works. And with regard to the health of the people living near these works, the inspector declares, it is true, that personally he feels the vigour of life must be diminished amid acid fumes, or, indeed, unpleasant fumes of any description. But this theory, with which most people would be inclined to agree, is upset by the mortality returns. Instances are given in which the death-rate in districts where alkali manufacture is carried on, is below the average town rate. And what is still more remarkable, diseases of the respiratory organs, which some suppose should be especially rife in an atmosphere impregnated with acid gas, is proved to be actually less numerous under those conditions. Thus the popular belief that the gases are favourable in cases of bronchitis and catarrh, seems somewhat justified by the reports. It is further suggested that although the fumes from alkali works are anything but pleasant, their action is less hurtful than that of the impurities which they destroy.

## The Political French Doctor.

An interesting and somewhat amusing article on French doctors, appeared last week in the columns of a morning contemporary—*The Daily News*. The writer institutes a comparison between the apathy of the English doctor in matters political as compared with that of his French *confrerés*, and who manage to wield a power in the state quite equal to that of the law. There are now, we are told, no less than thirty-eight members of the medical profession in the Lower House of Assembly, and, at least, a dozen in the Upper House, the Senate; they also muster thick in the Councils-General, and are more numerous still in the Municipal Councils, where they almost balance the legal element. The reason of this is obvious enough. The young doctor having completed his studies and got his diploma, soon discovers that he must struggle for a practice with a crowd of very hungry competitors. It is this overcrowding of the profession which drives so many physicians into politics. Some begin with journalism, inditing scientific articles to which their signatures are appended; others write books or pamphlets, in which they inveigh against the management of asylums and hospitals, others join political associations as amateur lecturers; but there remain not a few who become politicians by picking up influence as country doctors. Others who have branched off from their profession, because they were tired of the inactivity which wastes the best years of nearly every young doctor's life. Unless a man inherits a practice from a relative, or buys one ready made, it takes him from ten to twenty years to create one for himself, and even then there is much luck in the matter.

## The Public and Medical Fees.

The same writer before mentioned, under the heading of "The Political French Doctor," touches also upon the question of fees; and we regret to say that there is so much truth in his remarks on the public as regards doctors and their fees in France that they will equally apply to our own country. He says that the French physician receives fees that would seem to their English brethren very low.

"In Paris the best physicians expect 20 francs for a consultation at home, and 40 francs if they go out; but a rather exaggerated sentiment of professional delicacy prevents them as a rule from demanding more than a patient chooses to give. The table of a busy practitioner is littered over with gold pieces so grouped as to convey the hint that fees of one, two, or three Napoleons have been received; but if a patient lays down ten francs, or even five, he receives his bow and thanks without a protest, the doctor assuming (often wrongly) that the man has given all he can afford. In country towns five francs is the usual fee, but two francs are often given even by men who ought to know better; and two francs is the invariable fee which village doctors put down per visit when sending in their bills at the end of the year. One is ashamed to say that these doctor's bills often give rise to the sorriest haggling, for there exists a crooked opinion among the French peasantry and working classes, that a physician should reward himself as a philanthropist, and pay his butcher's bills with the mere thanks of his patients. A country doctor attends a prosperous peasant proprietor, day after day for weeks, supplies medicines, effects a cure; and at the end of the year is treated as an extortioner because he has charged a sum which will barely pay for the wear and tear of his horse and gig. Some doctors draw a regular salary from a medical club; but these are the worst used of all, for every member of the club feels bound to take out five or six times the value of his subscription in doctor's visits, even if he have nothing the matter with him. The political doctor must be held partly responsible for this queer state of things; and I am afraid he renders in many other ways a poor service to his non-political colleagues. If a peasant hears that in one village a young physician of some private means is endeavouring to make himself popular by refusing fees and supplying medicines—nay, sometimes wine, cigars, and warm clothing—he is likely to conceive a despicable opinion of his own over-worked practitioner, who cannot afford to race about the country for nothing. Professional etiquette ought to compel physicians to stand by one another in the matter of fees; but it does not."

## Immunity from Cholera of Workers in Copper.

At a recent meeting of the Congress of Hygiene M. Burq read a paper respecting the immunity of workers in copper from attacks of cholera. His researches had extended over a period of 25 years, and he was still convinced of the truth of this statement. Wherever he made careful inquiries he found that these workmen preserved their health during cholera epidemics, and he hoped that the Congress would take the question into their serious consideration. M. Géraud asked in what way this fact, should it prove to be true, could be applied to the prophylactic treatment of cholera. M. Layet, without disputing M. Burq's doctrine, said he had never

seen convincing proofs of this immunity. He would also like to know what practical conclusions M. Burq would draw from his observations. M. Burq said he had experimented on himself by taking every day small doses of sulphate of copper—at a time, too, when he was himself exposed to the disease. His object was to impregnate his system with copper in order to secure this immunity. It was by such impregnation that M. Burq accounted for the immunity of the town of Aubagne (between Toulon and Marseilles) during every epidemic of cholera, for a large quantity of copper was employed in the potteries which surrounded that town, and which raised around it a rampart, as it were, of copper dust. M. Marmisse had full confidence in the figures furnished by M. Burq, but distrusted those which had been adduced by indifferent observers. One could only arrive at the truth by verifying, as M. Burq had done, the facts themselves. The President also thanked M. Burq for his communication, and felt satisfied that the facts elicited would bear good fruit.

## Tobacco in America.

THE *Philadelphia Reporter* says, that in the United States alone, in the year 1875, there were raised, according to the revenue returns, four hundred and two million pounds (402,000,000 pounds). Last March we were informed, by a Baltimore merchant, that in that city there was only a moderate supply of the weed ready for export, one hundred and fifty-five thousand hogsheads! A single firm in New York paid to the Government, in one month, a revenue tax of 123,000 dols. Its average monthly tax for internal revenue is over 100,000 dols. The shipments of snuff by this house to one town in North Carolina amount to 100 barrels a month, or 1,200 barrels annually. And this is but a tithe of the snuff yearly sold by this one firm.

The quantity consumed in Great Britain is 20,000,000 pounds; in France it is 44,000,000 pounds; in Austria, 81,000,000. It is a principal source of revenue to every continental State. In 1865, Austria smoked 1,900,000,000 of cigars, nearly. Russia raises 25,000,000 pounds of tobacco for home consumption. But our own country leads all others easily in the consumption of the weed.

## Coroners and Post-mortem Examinations.

THE question as to whether medical men making a *post-mortem* by order of the coroner, and giving a report upon the same, are entitled to two guineas, was recently decided in favour of Dr. Charles Chittenden, who had sued the coroner for West Kent at the Greenwich County Court. In commenting on this case, the *West Kent Times* says that:—

"There is a grave question behind which is apt to be overlooked, but which, nevertheless, is of great moment. An inquest is intended to protect the living as well as to discover the cause of death; if, therefore, a medical man is permitted to make a *post-mortem* and report, and that is held to be sufficient, what becomes of the office of coroner? He virtually abrogates his functions in all such cases, and leaves wide open a door for crime and secresy. Everyone knows how stealthily a criminal works, how even medical men may be instruments in his hands for mischief, and it is just possible may be the very medium by which his fell purpose is carried out. Family doctors, too, out of consideration for their clients, are sometimes induced to conceal unpleasant facts, and thus defeat the very ends for which the coroner's court exists. To make medical men judge and jury too is not only unfair to them, but it is giving them a power they do not desire, imposes upon them duties they are not sworn to discharge, and certainly introduces a loose system which would be dangerous to society. The coroner must do his own work, and should pay without murmur those who assist, but who have neither the responsibility nor the power that he possesses."

With the general purport of these remarks we feel sure the profession will be disposed to agree, but still many instances will arise in which it would be advisable to have a *post-mortem* examination made, but not a coroner's inquest, and in which there is not the slightest suspicion of any foul play having taken place. Unfortunately, there is no special and well-defined legal provision made for such cases, and consequently in the interest of justice, and in the absence of any law on the subject, where the coroner has ordered a *post-mortem* examination to be made, he should, in our opinion, also hold an inquest.

## Adulteration of Drugs in England.

THE Report of the English Local Government Board for the year 1877, shows that of 503 samples of drugs analysed, 110 were reported adulterated. This is equal to 21·8 per cent. In the Metropolis and Sussex the proportion was 6·9 per cent., and in Lancaster, Stafford, and the West Riding, 37·7 per cent. This discrepancy seems to be due to the fact that some analysts regard as adulterated all articles not chemically pure.

## Rhubarb.

*New Remedies* says that the reports of the rhubarb crop from China are very unfavourable. The Shansi variety, which has been out of market for some time, is not likely to make its appearance at Shanghai, owing to the terrible famine, which is said to have carried off no less than 7,000,000 of souls in the province of Shansi alone.

LAST week at a meeting of the City of London Commission of Sewers, Dr. Saunders, the medical officer of health, reported that upon submitting to a chemical and microscopical analysis samples of foreign flour then in bond, it proved to be identical in appearance and in result with ordinary plaster of Paris. On the 3rd inst., he attended at the warehouses of the Customs House and Wool Quay, in Lower Thames Street, and seized it. Some of the flour had been sold to a foreign baker in Dean Street, Soho, who made from it 114 "wheaten" loaves of bread, two samples of which he now laid upon the table of the court. A resolution was approved to make application to the Lord Mayor to have the whole cargo condemned and destroyed at once.

THE Corporation of London has just voted a contribution of £100 per annum for the next five years towards "the Maintenance Fund" of the London Hospital; the Grocers' Company has given £50 in aid of the Royal Infirmary for Diseases of Women and Children, Waterloo Bridge Road, S.E.

On reference to our advertisement columns it will be seen that Dr. Mayberry, J.P., has been presented with a very flattering testimonial and piece of plate on his retirement, after forty years service, from the post of medical officer to the Kenmare Union and Dispensary District. Dr. Mayberry has certainly well earned the gratitude of those amongst whom he has laboured almost for a lifetime, and his exertions during the ravages of the famine, are probably fresh in the recollections of many who subscribed to the testimonial.

From our French exchanges we learn that M. Debelle, a young physician living at St. Denis, near Paris, has just died under singularly painful circumstances. He was in the very act of being married when he was suddenly taken ill and fell senseless before the altar. He was conveyed home, where he expired in a couple of hours. It is supposed that over-excitement consequent upon his wedding, combined with heart disease, was the cause of death.

The death rates in the 23 principal cities and large towns of the United Kingdom last week per 1,000 of the population, were :—Brighton 14, Portsmouth 16, Oldham 19, Sunderland 21, Newcastle-upon-Tyne 22, Bradford 22, Hull 22, Leeds, 23, Leicester 23, Edinburgh 23, Sheffield 24, Wolverhampton 26, Nottingham 26, London 27, Glasgow 28, Norwich 28, Bristol 30, Birmingham 31, Plymouth 32, Liverpool 32, Manchester 35, Salford 36, and the highest rate Dublin 45.

Charges have been brought forward against the Medical Officer for Longton, near Stoke-upon-Trent, to the effect that for six weeks he had left his pauper patients entirely to the care of his dispenser, who had no medical qualification. During this period one of the patients, it was stated, had died. The Board of Guardians, after considering the matter, determined to suspend the Medical Officer, and further to request the Local Government Board to institute an inquiry into his conduct.

Mr. R. T. E. B. Cooke, F.R.C.S. Ed., hon. surgeon to the Scarborough Dispensary, and the Sea Bathing Infirmary, was last week the fortunate recipient of a silver salver and a purse containing £340, presented by a number of grateful patients and friends. Gratitude does not often take so practical a shape as this.

A good deal is said, and not without some truth, of "our poor profession." Fortunately there are a few lucky ones among us, whose skill or ingratiatory manners are so prominent, that patients feel it incumbent upon them to present weighty purses, as in the case of Mr. Cooke before mentioned ; or, better still, to bequeath a legacy, as did the late Mr. Boards, of Edmonton, a few days ago to his medical attendant, Mr. William Hall, M.R.C.S., and his son, of £2,000.

Eleven ladies have presented themselves for the winter matriculation examination of London University under the new charter.

The death is announced of Deborah, widow of John Colvan, M.D., formerly of Armagh, in her 84th year. It will be remembered Dr. Colvan left £5,000 to the poor of Armagh, for ever ; and a considerable sum to the Royal Medical Benevolent Fund for Ireland. His will was contested at the time on the ground of mental incapacity, but was established.

We learn that Mrs. Bennett, of Priory House, Dudley, recently deceased, the sister of the late Mr. Guest, who left £20,000 to found the Guest Hospital, Dudley, has, by her will, bequeathed £3,000 to the Wolverhampton Orphanage, £5,000 to the Guest Hospital, Dudley, and £2,000 to the Dudley Dispensary.

The high zymotic death rate in Salford last week was due to the prevalence of measles, scarlet fever, and whooping-cough. Scarlet fever also showed excessive fatality in Birmingham, Oldham, and Leeds. Small-pox caused 12 more deaths in London, 18 in Dublin, but not one in the other large towns. In London the excessive mortality was due to affections of the respiratory organs.

At a meeting of the Senate of the Queen's University, held on Tuesday, December 31, it was arranged that the Examiners in Medicine, Surgery, Materia Medica, Medical Jurisprudence, and Midwifery, should, for the future, hold office for four years, instead of for two years as hitherto.

There has been started a rumour that a long-continued drought has injured the chances of the next opium crop. Another suggestion is, that the Turkish Government is likely to fix an export duty on the drug.

Dr. C. W. Long, of Athens, Georgia, the discoverer of modern anæsthesia, died on the 15th of last June, aged 63 years.

The Secretary of State for the Colonies has appointed Dr. Samuel Hamilton (Dublin) Medical Officer for the Falkland Islands.

# Scotland.

Pauperism in Lanarkshire.—The following is a comparative view of the registered paupers and their dependants for the year 1878, in proportion to the population of each parish in Lanarkshire :—Avondale, 1 in 25 of the population ; Banny, 1 in 38 ; Biggar, 1 in 29 ; Blantyre, 1 in 30 ; Bothwell, 1 in 32 ; Cadder, 1 in 40 ; Cambusneshan, 1 in 24 ; Cambuslang, 1 in 55 ; Carluke, 1 in 33 ; Carmichael, 1 in 29 ; Carmannock, 1 in 100 ; Carnwath, 1 in 35 ; Carstairs, 1 in 122 ; Corrington, 1 in 90 ; Cranford, 1 in 24 ; Cranfordjohn, 1 in 26 ; Culter, 1 in 59 ; Dalsey, 1 in 27 ; Dalziel, 1 in 42 ; Douglas, 1 in 26 ; Dolphinton, 1 in 43 ; Glasgow, 1 in 39 ; Glasford, 1 in 22 ; Govan Combination, 1 in 43 ; Hamilton, 1 in 27 ; Kilbride, 1 in 56 ; Lanark, 1 in 17 ; Lesmahagow, 1 in 23 ; Libberton, 1 in 46 ; New Monkland, 1 in 29 ; Old Monkland, 1 in 30 ; Pittemain, 1 in 31 ; Rutherglen, 1 in 31 ; Shotts, 1 in 36 ; Stunhouse,

1 in 37; Symington, 1 in 29; Walston, 1 in 47; Wandell and Lamington, 1 in 22; Wiston and Roberton, 1 in 22.

Glasgow Lock Hospital.—The annual meeting of qualified subscribers was held on the 14th inst., in the Religious Institution Rooms, Mr. Thomas Muirhead presiding. The Secretary, Mr. Robert Young, read the Annual Report of the directors, which stated—"That the hospital maintains its usefulness and efficiency. During 1878 there have been admitted about the same number as in the previous year—in all, 426; and the number dismissed cured has been 435, leaving 18 in the house. The average time each patient remained in the hospital was 26 days. Of the number admitted, more than one-half, or 227 were for the first time; more than one-fourth, or 125, were for the second; 53 for the third; 22 for the fourth; 5 for the fifth; 3 for the sixth; and 1 for the seventh. By far the largest number were young persons. The annual subscriptions have fallen off no less than £63—a result ascribed to the prevailing commercial distress, and general dulness of trade. The object for which the hospital was established is one which in a large city will always require attention; and the directors recommended the institution to the increased sympathy and support of benevolent friends. In addition to ministering primarily to the physical cure of the patients, there is brought to bear upon them much kindly encouragement by the Matron. About 12 per cent. of the inmates, on leaving, have been restored to their friends or placed in situations of comfort and respectability. Suitable books were during the year presented by the Duchess of Montrose and others. The directors tendered their thanks to the medical officers, and to Mr. Michael Rowan, for his unfailing sympathy and devotion to the moral welfare of the patients. The following gentlemen were elected as directors;—Rev. Thomas Somerville; Mr. W. R. W. Smith, from the Town Council; Mr. Millar, from the Merchants' House; Mr. William McCrone, from the Trades' House; Drs. Gairdner and Charteris, from the Faculty of Physicians and Surgeons; and from the subscribers—Colonel Campbell, of Blythswood; Messrs. David McCowan, James Orr, Thomas Thompson, Matthew Fairlie, and Thomas Muirhead, with T. D. Finlay as Treasurer, and Mr. Robert Young as Secretary.

"Glasgow Medical Journal."—After many vicissitudes of fortune and form, the *Glasgow Medical Journal* now appears in the form of a monthly, under the editorship of Dr. Joseph Coats. It is an enlargement on the form immediately preceding. The present No. contains "Original Articles," "Notes on Current Topics," "Reviews," "Reports of Hospital and Private Practice," "Meetings of Societies," "Medical Items," and there is an "excess of material"—a fact on which the editor has to be congratulated—in consequence of which eight extra pages are printed. A considerable list of gentlemen (chiefly local) who have promised contributions is given. Considerable activity is displayed by the younger men, in this manner, here at present, and between "inventions," cures," and "original observations" we are considerably exercised. In our next the journal may be noticed somewhat more in detail.

Measles at Carluke.—An epidemic of measles is prevailing in Carluke, but hitherto no deaths have been reported as due to it. A number of cases of gastric fever have recently occurred, and one death is ascribed to it. Scarlet fever exists in several parts of the parish.

Greenock Infirmary.—The annual meeting of the trustees of this institution was held in the chapel on the 16th inst. Provost Lyle occupied the chair, and amongst those present were, Mr. Stewart, M.P., Bailies Wilson, Walker, and Shankland, Provost Somerville, of Port Glasgow, Dr. McMillan, Dean Gordon, &c. Provost Lyle, in moving the adoption of the directors' report, remarked that the institution had now reached the 70th year of its existence. The directorate was very complete, and the organisation was more perfect than ever. Referring to the number of accidents treated, many were ascribed to intemperance and self-carelessness. Accidents to children were to be attributed to their being allowed to run about the streets without protection. He drew attention to the fact that in the case of many accidents attempts were made to cure them at home. This the directors considered an error, and urged that all such cases should be sent in at the outset. The dulness of trade had caused a falling off in the ordinary subscriptions. The infirmary had received two handsome legacies ducing the year. Provost Somerville, Mr. Stewart, and Dr. McMillan took part in the proceedings.

Suicide at the Glasgow University.—A student at Glasgow University has committed suicide by taking three grains of strychnine. He wrote a letter to his sweetheart informing her of his rash intention, and left it with his landlady with instructions to deliver it if he should not be up. The letter was delivered, and the student was found dead in his bedroom.

# Correspondence.

## MEDICAL ADVERTISING EIGHTY YEARS AGO.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I lately came across a copy of the *Times* newspaper for October 3, 1798, and thinking that some extracts from it may prove interesting to the readers of this paper, I reproduce a few advertisements which have a bearing upon the medical profession, and which throw a dim light upon the manner in which the profession conducted itself during the last century.

In those days there was not a medical paper extant, and hospital surgeons were obliged to advertise announcements of lectures, &c., in the lay newspapers, of which the following may be taken as specimens:—

Surgical Lectures.

MR. PEARSON, Surgeon to the Lock Hospital and Asylum, and of the Public Dispensary, will begin his Course of Lectures on the Principles and Practice of Surgery, in which he will deliver a copious account of Scrofula and Lues Venerea, on Monday next, at 7 o'clock in the Evening, at his Home, in Golden Square.

---

Midwifery,

Medical Theatre, London Hospital.

ON WEDNESDAY, October 10, at 11 in the forenoon, Richard Dennison, M.D., F.A.S., Man-Midwife to the City of London Lying-in Hospital, and Lying-in Charity, for Delivering Poor Women at their own Habitations, will commence his Lectures on the Theory and Practice of Midwifery and the Diseases of Women and Children; and for the convenience of Student's residing in, or Westward of the city, Dr. Squire, Physician and Man-Midwife to the Lying-in Hospital for Delivering Poor Women at their own Habitations will commence a Course on the same subject, at Hatton House, No. 16 Cross Street, Hatton Garden.

Further particulars may be known by applying to the Apothecary of the London Hospital; or at Dr. Dennison's, No. 37 Broad Street Buildings; and at Dr. Squire's, No. 7 Ely Place, Holborn.

---

Whether Mr. Pearson, of the Lock Hospital, is identical with George Pearson, M.D., F.R.S., who was a physician at St. George's Hospital, and a great experimenter in chemistry, I know not; but concluding that he was, he is credited with having analysed Dr. James' febrifuge powder, proving it to be composed of antimony and phosphate of lime, and he is

also said to founded the original vaccine institution in 1799. Thus it will be seen that the two men, if not identified, were, at any rate, contemporaries. I cannot find any further account of either Dr. Squire or of Dr. Dennison, and we must presume that their names have not been handed down to posterity.

In the degenerate days of the eighteenth century, members of the Royal College of Surgeons did not blush to advertise their nostrums in the advertising columns of the *Times*, very much in the same way that patent medicine sellers are in the habit of doing at the present time. A Mr. Thomas Taylor, M.R.C.S., has a long advertisement of some celebrated Soake's Patent Pills for the cure of scrofula, and publishes a long testimonial, which does not differ very materially from those seen in the papers of the present day. It commences as a matter of course with the usual "with the blessings of God," and there is appended the affidavit of a witness to the cure. This custom of appending the evidence of a witness seems to have gone out of fashion at the present day, though all the quack advertisements in the *Times* before me have one appended to each testimonial. It is to be presumed that the reason why this custom has died out is that the present generation are more credulous, and believe anything they see in print. I cannot find anything more in the papers relating to the medical profession, although there are many interesting paragraphs worth noticing, and which I hope to do something with elsewhere; but for the present I must remain content, trusting I have amused a few with the way the profession advertised, when George the Third was King.

I am, Sir,

Yours faithfully,

E. Cotterell.

University College, London.
Jan. 9, 1879.

## THE MEDICAL REGISTRAR OF THE SCHOOL OF PHYSIC IN IRELAND.

Those who wish well to the Medical School of the University of Dublin will learn with much regret that the Rev. S. Haughton, F.T.C.D., has retired from the administration of that School to which he has been attached for more than fifteen years. Assuming the supervision of it, Dr. Haughton found it in a somewhat musty condition, and in the process of rejuvenation found himself obliged to resort to proceedings which were more effectual than they seemed considerate towards others. His method of reconstruction might have been less direct and thorough, but it could scarcely have been more successful, for undoubtedly his *regime* has raised not only the School of Physic, but the University medical and surgical degrees, to a position level with that of the most pretentious qualifications in the United Kingdom. The services of Dr. Haughton to the University in this direction were of especial value during the last decade, because, within that period the Divinity School of Trinity College, which had always been its mainstay, was deprived, to a certain extent, of its functions by the disestablishment of the Irish Church, and had not the Medical Faculty of the University then attracted students and created prestige for the University, the effect upon "Old Trinity" might have been serious, indeed.

Without being prepared to follow Dr. Haughton in some of his acts of revolution in the school, we cannot refrain from expressing our admiration of the policy pursued in all instances in reference to the University degrees.

From the first he seems to have understood that it would be well if he could teach the administrators of other licensing bodies that money gained by the sale of low class diplomas is, at least in the case of an old university, a profit dearly bought. From the first he set his face against the cheapening of the university degrees in either of the three requirements, money, time, or education; and, disregarding the serious competition of cheap and nasty medical qualifications, he followed throughout the wise and far-seeing policy of making the M.D., Dub. Univ., the best degree in the medical market, trusting that its worth would, after a little time, be appreciated both by the medical profession and the public.

Dr. Haughton's confidence, we are glad to say, was not misplaced. Every improvement in, and addition to, the curriculum or the examination, every disciplinary requirement enforced in the school, though it may have driven off the unambitious, idle student, or the pupil who only wanted as much knowledge as would enable him to creep into the practice of medicine, proved an attraction to the better class of men, and before long filled the school with the sort of students who might carry the University M.D. into the highest position.

We hear that Dr. Haughton's retirement, though contemplated for some time, has been now occasioned by an act of disrespect to his official authority on the part of other officials of the University, and we regret that a matter which, however annoying, is still comparatively unimportant, should have deprived the medical faculty of the University of a stimulus which it can ill-afford to lose. Let us hope that the severance of his official connection with it will not necessarily take from the medical department of Trinity the learned professor's interest in its success, nor be the cause of any change in the policy, which has produced in the fifteen years of his service such excellent results.

# Medical News.

**King and Queen's College of Physicians in Ireland.**—At the recent examinations for the licences of this College the following candidates were successful:—

For the licence to practise Medicine—

Lewellin, A. J. R. | O'Shaughnessy, P. J. B.
Thompson, Andrew Colquhoun.

For the licence to practise Midwifery—

| | |
|---|---|
| Forster, H. Blackett. | Johnston, J. Reid. |
| Gibson, Joseph. | O'Shaughnessy, P. J. B. |
| Gordon, Robert. | Thompson, A. C. |

**Society of Public Analysts.**—At the annual general meeting of this Society, held at the Chemical Society, Burlington House, on Wednesday last, the 15th inst., Dr. Muter, Public Analyst for Lambeth, Newington, Wandsworth, Southwark, Bermondsey, Rotherhithe, and the Borough of Tenterden, was elected President for the ensuing year in succession to the retiring President, Dr. Dupré. The Vice-Presidents elected were Drs. Dupré (Westminster), Campbell Brown (Liverpool), and Tripe (Islington). Papers on interesting points in the analysis of phosphates, butter, &c., were read by Messrs. Hehner, Jones, and Mills, and the meeting adjourned till February 19th. Afterwards the annual dinner took place at the Café Royal, Regent Street, Dr. Muter, the new President, in the chair.

**An Aerated and Mineral Water Association.**—An influential body of chemists and druggists have just started an association under the above heading, with a capital of £5,000 for the purposes of manufacturing and supplying to shareholders who are chemists, and to hospitals, aërated and mineral waters of the British Pharmacopœia and others of specified formulæ and guaranteed quality; and to deal generally in the waters of the various mineral springs in Great Britain.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and void the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

DR. JOHNSON.—Your paper "On Blood-letting" received.

PROF. CHARCOT'S LECTURES "On Diseases of the Lungs" (con inuation) are omitted this week, the engraver not having finished his work. We hope, however, to continue them in our next.

LUNACY DEPARTMENT.—Communications in this department received since our last will appear next week.

MR E. M. B.—When we are a little less pressed for space than at present we shall be happy to commence your papers. To short communications, letters, &c., we are compelled to give preference during the meeting of the Societies.

A CURIOUS CUSTOM.—Matters concerning Afghanistan being now *en regle*, the following interesting note from the January number of the *Veterinary Journal* will be read with interest:—"They have a curious custom in Cabul and Central Asia in selling a horse. A man wanting to dispose of one is desirous that the horse should not be aware of his wish to part with him, the fear being that if the beast knew that his master wished to get rid of him he would take it to heart and lose flesh, and consequently decrease in value. From this strange idea the sale of a horse is carried on in silence, so that the animal may not hear. The two men put their hands under their kummerbands, and the price in rupees is indicated by repeated pressure on the fingers, but not a word is uttered during the bargain."

CLINICAL SOCIETY OF LONDON.—On Friday evening, Jan. 24, Dr. Southey, "Pleuritic Effusions treated by Capillary Drainage."—Dr. Althaus, "Disease of the Spinal Accessory Nerve."—Dr. Ord, "Clinical aspect of Rheumatoid Arthritis."—Mr. George Brown will exhibit a Case of Descent of Testis in a Patient, aged 30.

TESTIMONIALS.—Mr. P. Hinckes Bird writes to the *Sanitary Record* complaining of the system of analysts giving testimonials for publication. He has heard, on unimpeachable authority, that one distinguished testimonial-giver offers to report favourably on any article for five guineas. Mr. Bird does not do that sort of business. Once applied to with a specimen, he says he replied thus:—"Gentlemen,—I have tasted your —— Whisky, and, having tried various vermin-killers in my time, believe yours superior to them all. You are at liberty to make use of this."

HUNTERIAN SOCIETY.—This (Wednesday) evening, at 7½, Council Meeting.—8. Clinical Evening: Several Members will relate Cases of Interest; Dr. F. C. Turner will exhibit Microscopic Specimens from Cases of Sclerosis.

ASSOCIATION OF SURGEONS PRACTISING DENTAL SURGERY.—This evening, at 7½, Council.—8. Annual General Meeting for Election of Officers.—Adjourned Discussion on Dr. C. Meymott Tidy's paper, "On Anæsthetics."

QUEKETT MICROSCOPICAL CLUB.—On Friday, Jan. 24, at 8 p.m. Mr. F. A. Bedwell, "On the Urticating Threads of Actinia Parasitica."—Mr. E. T. Newton, "On a new Method of Preparing a Dissected Model of an Insect's Brain, from Microscopic Sections."

"TO PUPILS IN ELOCUTION."—These lines, by Mr. Charles A. Prince, of Boston, originally appeared in the *Harvard Advocate*:—

The human lungs reverberate sometimes with great velocity
When windy individuals indulge in much velocity.
They have to twirl the glottis sixty thousand times a minute,
And push and punch the diaphragm as though the deuce were in it.
*Chorus*—
The pharynx now goes up;
The larynx, with a slam,
Ejects a note
From out the throat,
Pushed by the diaphragm.
—*Scribner's Monthly.*

HARVEIAN SOCIETY OF LONDON.—On Thursday, Feb. 6, at 8.30 p.m., Mr. Teevan, "On Incontinence and Retention of Urine in Children."—Dr. Norman Kerr, "The Mortality from Intemperate Drinking, and how best to arrive at the truth."

### BOOKS AND PAMPHLETS RECEIVED.

Fashions of the Day in Medicine and Science. By H. S. Constable. Hull: Leng & Co.

Braithwaite's Retrospect of Medicine. Vol. LXXVIII. London: Simpkin, Marshall, & Co.

On Deafness, Giddiness, and Noises in the Head. By E. Woakes, M.D. London: J. & A. Churchill.

Ozone in Relation to Health and Disease. By H. Day, M.D.

On Giant Urticaria. By J. L. Milton, M.R.C.S.

Domestic Medicine and Hygiene. By W. J. Russell, M.D. Second Edition. London: Everett & Co.

An Essay on Hydropathy. By S. M. Boddy, F.R.C.S.

Checks to Population. By C. H. F. Routh, M.D.

Outlines of Medicine. By C. E. Armand Semple, M.D. London: Baillière, Tindall, & Cox.

Aids to Therapeutics and Materia Medica. By C. E. Armand Semple, M.D. London: Baillière, Tindall, & Cox.

Alcohol: a Remedy; a Poison. By Godwin Timms, M.D.

### VACANCIES.

Athy Union, Auxiliary Small-pox Hospital.—Medical Officer. Salary, £3 per week. Election, Jan. 22.

Cootehill Union, Drum Dispensary.—Medical Officer. Salary, £100. Election, Jan. 27.

Crediton Union.—Medical Officer for the Cheriton District. Salary, £70, with the usual fees extra. Applications to the Clerk of the Guardians before Jan. 31.

Inverness District Asylum.—Assistant Medical Officer. Salary, £80, with board. Applications to Dr. Aitken before Feb. 8.

Kilkeel Union Workhouse.—Medical Officer. Salary, £20. Election, Jan. 29.

Kilkeel Union, Kilkeel Dispensary.—Medical Officer. Salary, £100, with fees. Election, Jan. 29.

Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70, with board. Applications to the Chairman before Jan. 31.

London Fever Hospital.—Resident Medical Officer. Salary, £200, with residence. Applications to the Secretary before the 10th prox., Islington, N.

Mallow Union Workhouse.—Medical Officer and Consulting Sanitary Officer. Salary, £100. Election, Jan. 24. (See Advt.)

St. George's Union, London, W.—Medical Officer for the "A" District. Salary, £100, with the usual extra fees. Applications to the Clerk of the Union.

Tiverton Infirmary.—Dispenser. Salary, £100. Applications to the Hon. Sec.

Tuam Union, Abby Dispensary.—Medical Officer. Salary, £120, with fees, &c. Election, Feb. 3. (See Advt.)

Warrington Infirmary.—Resident Surgeon-Apothecary. Salary, £200, Applications to the Hon. Sec. before Jan. 21.

Waterford Union Workhouse.—Medical Officer. Salary, £100. Election, Jan. 29.

### APPOINTMENTS.

BROCK, A. C., L.R.C.P.L., M.R.C.S.E., Assistant House Surgeon to the General Hospital, Bristol.

BUCKLE, J., M.R.C.S.E., Resident Medical Officer to the Children's Hospital, Brighton.

CHRISTAL, J., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer, &c., for the Collon Dispensary District of the Ardee Union, co. Louth.

CROCKETT, E., L.R.C.P., L.R.C.S.Ed., Medical Officer for the Longford District of the Ashbourne Union, Derbyshire.

HAMMOND T., L.R.C.P.L., M.R.C.S., Assistant House Surgeon to the Halifax Infirmary and Dispensary.

HOPKINS, J., M.R.C.S.E., Assistant Medical Officer to the Central London Sick Asylum District Asylum.

HUGHES, R. L., L.R.C.S.I., L.K.Q.C.P.I., Medical Officer to the Kilcock Dispensary, Celbridge Union.

KELLY, C., M.D., M.R.C.P., Professor of Hygiene at King's College.

MAY, J., M.R.C.S.E., a Senior Surgeon to the Royal Albert Hospital, Devonport.

O'DOHERTY, J. J., L.R.C.P.Ed., Medical Officer, Medical Officer of Health, &c., for the Cushendall Dispensary District of the Ballycastle Union, co. Antrim.

PATTEN, W., B.A. T.C.D., L.R.C.S.I., Resident Surgeon to the City of Dublin Hospital.

PENMAN, P. M., M.B., C.M., Assistant Medical Superintendent to the Stirling District Lunatic Asylum.

PICKERING, G. F., L.R.C.P.L., M.R.C.S.E., House Surgeon to the General Hospital, Bristol.

SILCOCK, A. Q., M.R.C.S.E., Surgical Registrar to University College Hospital.

TAYLOR, S. T., M.B., L.R.C.P.L., a Physician to the Norfolk and Norwich Hospital.

## Births.

ADAMSON.—Jan. 10, at Lurgan, co. Armagh, the wife of J. G. Adamson, M.D., of a son.

KENNEFICK.—Jan. 12, at Clonmel, co. Tipperary, the wife of John S. Kennefick, M.D., of a son.

MURRAY.—Jan. 17, at Scarborough, the wife of Ivor Murray, F.R.S.E., F.R.C.S., of a son.

ODLING.—Jan. 14, at Norham Gardens, Oxford, the wife of Professor Odling, F.R.S., of a son.

YOUNG.—Jan. 14, at Bootle, near Liverpool, the wife of T. F. Young, L.K.Q.C.P.I., M.R.C.S., of a son.

## Deaths.

AMBLER.—Jan. 11, at Hemel Hempstead, Herts, of scepticæmia, followed by apoplexy, Edward Holland Ambler, F.R.C.S. & L.S.A.L., Senior Surgeon West Herts Infirmary, &c., &c., aged 57.

CARRICK.—Jan. 7, at Newcastle-on-Tyne, William Carrick, Surgeon, formerly of Carlisle.

COPINGER.—Jan. 11, at Grand Parade, Cork, John Copinger, M.D.

CROFTS.—Jan. 17, at British Honduras, Freeman Wills Crofts, M.B., Surgeon, Army Medical Department, aged 25.

GOODICKE.—Jan. 6, found dead in bed, Edward F. W. R. Goodicke, L.F.P.S.G., of Freemason Terrace, Stratford, aged 45.

MASON.—Jan. 13, at Sudbury, Suffolk, Maurice Mason, M.R.C.S.E. L.S.A.L., aged 75.

MURPHY.—Jan. 11, at 15 Nottingham Place, London, N.W., Helena, widow of Dr. Murphy, late Professor of Midwifery in University College, aged 72.

PRESTON.—Jan. 2, at Ballycassidy, co. Fermanagh, E. Preston, A.B., L.R.C.S.I.

THOMASON.—Jan. 11, at Whittall Street, Birmingham, R. Thomason, M.R.C.S.E., aged 51.

# IRISH POOR-LAW INTELLIGENCE.

## CONTAGIOUS DISEASES ACT.

29 VICT., CAP. 35, 11th JUNE, 1866

*(Continued from our last).*

An Act for the better Prevention of Contagious Diseases at certain Naval and Military Stations.

BE it enacted by, &c.

### DETENTION IN HOSPITAL.

20. *Certificate of Visiting Surgeon.*—If on any such examination the woman examined is found to be affected with a contagious disease, she shall thereupon be liable to be detained in a certified hospital subject and according to the provisions of this Act, and the visiting surgeon shall sign a certificate to the effect that she is affected with a contagious disease, naming the certified hospital in which she is to be placed; and he shall sign that certificate in triplicate, and shall cause one of the originals to be delivered to the woman and the others to the superintendent of police.

21. *Placing in Certified Hospital for Treatment.*—Any woman to whom any such certificate of the visiting surgeon relates may, if she thinks fit, proceed to the certified hospital named in that certificate, and place herself there for medical treatment, but if after the certificate is delivered to her she neglects or refuses to do so, the superintendent of police, or a constable acting under his orders, shall apprehend her, and convey her with all practicable speed to that hospital, and place her there for medical treatment, and the certificate of the visiting surgeon shall be a sufficient authority to him for so doing.

22. *Detention in Hospital.*—Where a woman certified by the visiting surgeon to be affected with a contagious disease places herself, or is placed as aforesaid, in a certified hospital for medical treatment, she shall be detained there for that purpose by the chief medical officer of the hospital until discharged by him by writing under his hand.

The certificate of the visiting surgeon, one of the three originals whereof shall be delivered by the superintendent of police to the chief medical officer, shall, when so delivered, be sufficient authority for such detention.

23. *Power to Transfer to another Certified Hospital.*

24. *Limitation of Detention.*—Provided always, that any woman shall not be detained under any one certificate for a longer time than three months (extended to six months by Sec. 6 of Amendment Act), unless the chief medical officer of the hospital in which she is detained, and the inspector of certified hospitals, or the visiting surgeon for the place whence she came or was brought, conjointly certify that her further detention for medical treatment is requisite (which certificate shall be in duplicate, and one of the originals thereof shall be delivered to the woman); and in that case she may be further detained in the hospital in which she is at the expiration of the said period of three months by the chief medical officer until discharged by him by writing under his hand; but so that any woman be not detained under any one certifictte for a longer time in the whole than six months.

25. *Power for Woman detained to apply to Justice for Discharge.*—If any woman detained in any hospital considers herself entitled to be discharged therefrom, and the chief medical officer of the hospital refuses to discharge her, such woman shall on her request be conveyed before a justice, who, if he is satisfied upon reasonable evidence that she is free from a contagious disease, shall discharge her from such hospital, and such order of discharge shall have the same effect as the discharge of the chief medical officer.

26. *During conveyance to Certified Hospital, &c., Women deemed to be in Legal Custody.*

27. *Expenses of Woman's Return Home.*—Every woman shall, on her discharge from the hospital, be sent to the place of her residence, if she so desires, without expense to herself.

### REFUSAL TO BE EXAMINED, ETC.

28. *Punishment of Woman for refusing to be Examined, &c.*—In the following cases, namely—

(*a*) If any woman subjected by order of a justice under this Act to periodical medical examination at any time temporarily absents herself, in order to avoid submitting herself to such examination, on any occasion on which she so ought to submit herself, or refuses or wilfully neglects to submit herself to such examination on any such occasion.

(*b*) If any woman authorised by this Act to be detained in a certified hospital for medical treatment quits the hospital, without being discharged therefrom by the chief medical officer thereof by writing under his hand (the proof whereof shall lie on the accused).

(*c*) If any woman authorised by this Act to be detained in a certified hospital for medical treatment, or any woman being in a certified hospital under medical treatment for a contagious disease, refuses or wilfully neglects while in the hospital to conform to the regulations thereof approved under this Act.

Then and in every such case such woman shall be liable to imprisonment, with or without hard labour, in the case of a first offence, for any term not exceeding one month, and in the case of a second or any subsequent offence for any term not exceeding three months; and in the case of the offence of quitting the hospital without being discharged as aforesaid, the woman may be taken into custody without warrant by any constable.

29. *Effect of Order of Imprisonment for Absence, &c., from Examination.*

30. *Effect of Order of Imprisonment for quitting Hospital, &c.*

31. *Penalty on Woman discharged Uncured conducting Herself as Prostitute.*—If on any woman leaving a certified hospital a notice in writing is given to her by the chief medical officer of the hospital, to the effect that she is still affected with a contagious disease, and she is afterwards in any place for the purpose of prostitution without having previously received from a visiting surgeon appointed under this Act a certificate in writing endorsed on the notice, or on a copy thereof, certified by the chief medical officer of the hospital (proof of which certificate shall lie on her), to the effect that she is then free from a contagious disease, she shall be liable to be imprisoned with or without hard labour in the case of a first offence for any term not exceeding

one month, and in the case of a second or any subsequent offence for any term not exceeding three months.

32. *Duration of Order.*—Every order under this Act subjecting a woman to periodical medical examination shall be in operation and enforceable, in manner in this Act provided, as long as and whenever from time to time the woman to whom it relates is resident within the limits of the place to which this Act applies wherein the order was made, or within five miles (10 miles, *see* sec. 5 of Amendment Act) of those limits, bnt not in any case for a longer period than one year; and where the chief medical officer of a certified hospital, on the discharge by him of any woman from the hospital, certifies that she is free from a contagious disease (proof of which certificate shall lie on her), the order subjecting her to periodical medical examination shall thereupon cease to operate.

RELIEF FROM EXAMINATION (*see* Sec. 9 of Amendment Act).

33. *Application for Relief from Examination.*—If any woman subjected to a periodical medical examination under this Act (either on her own submission or under the order of a justice), desiring to be relieved therefrom, and not being under detention in a certified hospital, makes application in writing in that behalf to a justice, the justice shall appoint by notice in writing a time and place for the hearing of the application, and shall cause the notice to be delivered to the applicant, and a copy of the application and of the notice to be delivered to the superintendent of police.

34. *Order for Relief from Examination on Discontinuance of Prostitution, &c.*—If on the hearing of the application it is shown, to the satisfaction of a justice, that the applicant has ceased to be a common prostitute, or if the applicant, with the approval of the justice, enters into a recognisance, with or without sureties, as to the justice seems meet, for her good behaviour during three months thereafter, the justice shall order that she be relieved from periodical medical examination.

35. *Forfeiture of Recognisance by return to Prostitution.*

PENALTIES FOR HARBOURING, ETC.

36. *Penalties for Permitting Prostitutes having Contagious Disease to resort to any house, &c., for Prostitution.*

37, 38, 39, 40, 41, METHODS OF LEGAL PROCEDURE, ETC.

42. *Limitation of Actions, &c.*

## THE CONSTABULARY AND THE PUBLIC HEALTH ACT.

A RECENT issue of the *Leinster Express* contained a report of the trial at Monasterevan Petty Sessions of a constable of the Royal Irish Constabulary for alleged neglect of duty under the Public Health (Ireland) Act, 1878. A correspondent of the *Express* asks, was it possible that the guardians of the peace, who of necessity come in contact with and mix so much amongst the public, were obliged, as part of their duty, to come in contact with, and assist in the removal of, persons suffering from contagious and infectious diseases. With some curiosity, he says, I procured a copy of the Public Health Act, and examined the sections (141 and 142) relied on for the prosecution as applicable to the case. My surprise now increased when I found that the constabulary force was not in any way referred to therein, and had no duty whatever to perform thereunder; but that the duty was to be performed by "the constables and officers of the Sanitrry Authority." Of course it is quite possible that some of the wiseacres who govern our peace force may have attempted to improve on the wisdom of the legislature, and instructed the constabulary that it was their duty to act as the officers of "the Sanitary Authority," remove small-pox sufferers one moment, assist an unfortunate inebriate to the lock-up the next, mix among and and come in contact with his comrades in close companionshsp.

In this matter, however, the public have one great protection arising from the difficulty of procuring a magistrate who would, under the section quoted, issue an order to the "Royal Irish."

Obviously it is the duty of the Sanitary Authority to provide a proper staff of "constables" for the enforcement of the law and the protection of the public health; and to the members of such staff only can orders for the removal of sufferers be addressed by either justices of the peace or the Sanitary Authority, and the sooner this fact is realised by those charged with the administration of the Public Health Act the better.

## DEATH OF DR. PRESTON, OF KILKEEL.

WE regret to announce the sudden and unexpected death of Dr. E. F. Preston, which melancholy event took place on the 2nd inst. at Killadeas Rectory, at Ballycassidy, co. Fermanagh, where he had gone after a severe attack of illness, caused, it was believed, by overwork, to seek change of air. Dr. Preston was called away at the early age of 34 years. Throughout Mourne there is the deepest sympathy for the bereaved. The deceased gentleman was appointed one of the medical officers of the dispensary district of Kilkeel upwards of nine years ago, and some time afterwards he was elected to the position of medical officer of the Kilkeel Union Workhouse. The duties of these important trusts he discharged with remarkable fidelity.

## WATERFORD UNION.

The Clerk read a letter from the secretary of the Kilmeaden Dispensary Committee to the effect that Dr. Arthur only worked for them for one day, and was only entitled to one day's salary. Dr. Arthur was appointed for a week, but Dr. Cutlar got well immediately, and then Dr. Arthur was, the committee say, apprised that he was wanted no longer, and they say he seemed satisfied with the arrangement.

Dr. Scott—The committee say they are not bound to sanction the appointment made by Doyle, the relieving officer.

Ald. Freeman—The letter of the committee says "we appointed Dr. Arthur for one week."

Mr. Conn.—Let them settle it among themselves.

The matter then dropped.

## KILCOCK DISPENSARY.

A MEETING of the members of this dispensary was held to elect a medical officer, the position falling vacant.

There were two candidates for the appointment, viz., Dr. R. L. Hughes and Dr. Wade. Both gentlemen were duly proposed and seconded, and on a division the voting was as follows:—For Dr. Hughes, 7. For Dr. Wade, 6.

The contest excited considerable interest in the locality as may be judged from the close voting.

## MOUNTMELLICK UNION.

(CLONASLEE DISPENSARY) FEE ON TICKETS.

THE honorary secretary of the Clonaslee dispensary forwarded the minutes of the last meeting of the committee, by which it appeared that Mr. Wrafter, J.P., was unanimously elected chairman. With reference to the circular from the Local Government Board, dated 3rd August, 1878, relating to the issue of dispensary tickets, the committee recorded their opinion that it was advisable to mark on the back of any visiting ticket such sum as the person issuing such ticket may judge the recipient, though not able to give the full fee, can fairly pay.

## NAAS UNION.

### SURCHARGE FOR A MIDWIFE'S EXPENSES.

THE clerk reported that the auditor surcharged the sum of 15s., paid to the midwife of the Naas and Carrogh dispensary for car-hire incurred by her in going to attend a case at the extreme limit of her district.

Mr. Mansfield—I find on reference to the minutes of the dispensary committee that when Mrs. Murtha was appointed, there was a specific arrangement as to mileage being paid to her for any distance beyond a mile from Naas. She was to get 9d. per mile for going and returning during the day, and 1s. per mile for going and returning during the night.

The Clerk—The auditor will be here next week, and I can draw his attention to the matter, and show him the minutes of the dispensary committee.

Resolved—"That this board are of opinion the sum of 15s. disallowed by the auditor, ought not to be surcharged, because the midwife in question was in the habit of being paid car hire in cases where she had to travel a long distance, and in the present instance she had to go more than eight miles, and the board think she could not possibly be in time if she had to walk there and back. It also appears from the minute of the Naas and Carrogh dispensary committee, that an arrangement was made with the midwife to give her a car whenever she had to go beyond a certain distance, and several payments were made to her without any questions, in pursuance of said agreement."

### IDIOT INMATES.

The Clerk stated that he had been called on by the Local Government Board to send in a return of the number of idiotic and epileptic inmates of the house. This he would do immediately.

## RELIGION AND DOCTORING IN THE IRISH POOR LAW.

ONE of the disreputable scenes which not unusually distinguish the election of Poor-law medical officers in Ireland took place at the Waterford Board of Guardians last week. Upon the resignation of Dr. Elliott it became necessary to elect a temporary medical officer for a fortnight, the prize thus to be disposed of being the permission to work hard for fourteen days for about six shillings a day. Thereupon followed the usual religio-political wrangle. One guardian moved that the medical officer who was now doing the duty should be continued for the fortnight. The following is the report of what followed :—

Mr. Conn said Dr. B. (the medical officer in possession) had his position placed before them in the highest way possible. The doctor was likely to be at the head of the profession at no distant date, but he (Mr. Conn) represented a number of ratepayers, most of whom were Catholics, and he was bound to respect their feelings, and they thought that the medical officer should be a co-religionist when he was going to perform duties, even for a fortnight.

The Mayor—I rise to order. The question of religion is not one to introduce in such a discussion (hear, hear).

Sir R. Paul—We don't care a fig for the reasons you have for your vote. We only want to know how you will vote. We don't care as to what the religious feelings of your constituents may be.

The Mayor—I think a medical man might go into his hospital and attend properly to people without their knowing whether he was a Catholic or a Protestant (hear, hear.)

Mr. Conn—I will appeal to Major O'Gorman if there is interruption in Parliament when a personal explanation is made.

Major O'Gorman—Personal explanations are very brief (laughter).

Captain Power—Mr. Conn says he will give his reasons why and how he will vote.

Mr. Conn went on to say that Dr. A. was a very clever young man who was highly spoken of, and he might say that in proposing Dr. A. for the temporary position, he also looked to his occupying the office permanently (laughter).

Dr. Scott seconded the motion.

Mr. Fortescue deprecated the introduction of the religions element.

A poll was then taken—for Dr. Arthur, 23; for Dr. Browne, 14.

We need hardly observe that in this proceeding, which we regret to say is the usual method of election in Ireland, it did not matter a straw to the contending factions whether the respective candidates were the best men, or even moderately competent for the duties. They would have travelled the same distance with the same alacrity to vote for the most thorough incapable if called by the crack of the politico-religious whip. Meanwhile, the sick poor and their necessities are utterly ignored.

## THREAT TO DISSOLVE THE LONGFORD BOARD OF GUARDIANS.

AT the last meeting of the Board of Guardians of the Longford Union, the following letter from the Local Government Board was read :—

"14th January, 1879.

SIR,—The Local Government Board for Ireland acknowledge the receipt of the minutes of the proceedings of the Board of Guardians of the Longford Union of the 8th inst., containing a resolution postponing until that day fortnight the consideration of the letter of the Local Government Board of the 7th inst., relating to the report of Dr. Cameron, analyst, of the result of the analysis made by him of six samples of water from the principal source of water supply in the town of Longford, and drawing attention to the seriously defective condition of the water supply as revealed by the analysis, and to the necessity for prompt action in the matter on the part of the sanitary authority. The guardians proceed in their resolution to express the opinion that they should be relieved of the duty of providing a supply of water for the town, and of looking after its sanitary arrangements, as they are Town Commissioners, on whom the guardians consider such duties more properly devolved; and, in reference thereto, the Local Government Board have to state that the mode in which the guardians can be relieved from their responsibility as the sanitary authority is *indicated in the 211th section of the Public Health Act*, 1878, *and this course the Local Government Board are quite prepared to take if the guardians continue to ignore their obligations under the sanitary laws.*

"By order of the Board,

"B. BANKS, Chief Clerk."

The 211th section of the Act above referred to, is as follows :—

211. Where complaint is made to Local Government Board, that a sanitary authority has made default in providing their district with sufficient sewers, or in the maintenance of existing sewers, or in providing their district with a supply of water, in cases where danger arises to the health of the inhabitants from the insufficient or unwholesomeness of the existing supply of water. A proper supply can be got at a reasonable cost, or that a sanitary authority has made default in enforcing any provision of this Act, which it is their duty to enforce, the Local Government Board, if satisfied, after due inquiry, that such authority has been guilty of the alleged default, shall make an order limiting a time for the performance of their duty in the matter of such complaint. If default is made to obey such order, and to perform such duty by the time limited in the order, such order may, in the case of an urban authority, be enforced by writ of man-

damus, and in the case of a rural authority making such default as is last mentioned, such rural authority shall be deemed to have made a default in the execution of their duties as a Board of Poor-law Guardians under the Poor-law Acts, and thereupon it shall be lawful for the Local Government Board to dissolve them as such board, and to provide for the execution of their duties under the Poor-law Act, and this Act in manner prescribed by the Poor-law Acts in the case of the dissolution of Guardians of Poor-law unions.

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JAN. 11, 1879.

| | | |
|---|---|---|
| Total registered deaths in Dublin and suburbs* | ... | 271 |
| Ten years average of same week ... ... | ... | 187 |
| Excess of mortality above average ... ... | ... | 84 |
| 10 weeks' ratio of deaths Rathmines | 23·1 | per 1,000 |
| „ „ „ Donnybrook† | 24·3 | „ |
| „ „ „ Blackrock | 12·3 | „ |
| „ „ „ Kingstown | 22·2 | „ |
| „ „ Entire Dublin District | 44·8 | „ |
| COMPARATIVE RATIOS—London ... | 27·0 | „ |
| „ „ Glasgow ... | 28·1 | „ |
| „ „ Edinburgh ... | 23·2 | „ |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Diseases of the respiratory organs, to which 104 deaths were ascribed in the week ended Saturday, 4th instant, caused 100 of the deaths registered last week. Of this number 78 were referred to bronchitis, 12 to pneumonia, and 10 to lung disease unspecified; the average number of deaths in the corresponding week of the last ten years from this class of disease was 50. The average mean temperature for the second week of the years 1868-77 was 41·2, whilst the mean temperature for the past week was as low as 30·6.

Fifteen children died from convulsions.

Bronchitis caused 78 deaths, pneumonia 12, and lung disease unspecified 10.

Ten deaths were ascribed to paralysis, 2 to apoplexy, 2 to brain disease unspecified, 1 each to cephalitis and epilepsy; 5 to heart disease and 1 to aneurism; 4 to kidney disease, 3 to liver disease, and 1 to nephria.

Phthisis was the cause of 17 deaths, hydrocephalus of 3, scrofula of 1, mesenteric disease of 1, and cancer of 3.

Seventy-eight of the persons whose deaths were registered during the week were under under 5 years of age (39 being infants under 1 year old); and 77 were aged 60 and upwards, including 43 persons aged 70 and upwards, of whom 3 (women) were stated to have been aged respectively 90, 93, and 94 years.

LIMERICK.—Two deaths from whooping-cough.

## A CURIOSITY OF LITERATURE.

A CORRESPONDENT in the Irish provinces has sent us the following reply of the Honorary Secretary of a Dispensary Committee, to his application for information respecting a vacant appointment.

The document is on a half sheet of note paper, and in blue ink.

DEAR SIR,—There are to local medical docteres to compate for the Ballymacarbery Depensary.

Hear are the names of Comittee of the Depensary. (Here follow names—many of which are wrongly spelt.) You have the names of the Comitee of manegent for the Dispensery of Ballymacarberry, and the day of apointment of a docter will be ———

I am, yours truly,

———.

## LETTSOMIAN LECTURES. (a)

### Lecture I.

### ON BRONCHIAL ASTHMA: ITS HISTORY AND NATURE.

By JOHN C. THOROWGOOD, M.D., F.R.C.P.,

Physician to Victoria Park Hospital for Diseases of the Chest, and to the West London Hospital.

*(Continued from our last).*

Let us now proceed to inquire how far the results of experiment accord with observed clinical facts.

The musical wheezings heard in the air-tubes of a person during a fit of asthma are, as Salter says, positive evidence of bronchial contraction, and the sudden way in whlch these wheezy sounds may shift from one part of the chest to another is proof that the contraction is spasmodic, and not due to mucous congestion or œdema. "Thus," says Salter, "we see by evidence as certain as sight, that in asthma bronchial spasm must, and does, exist, and that no other conceivable supposition will explain the phenomena." I myself, when considering the causation of asthma some time ago, got the idea that if the lung be contracted air must be squeezed out of it like water from a sponge, and that then we ought to have impaired chest resonance on percussion. Desirous as I then was to demonstrate such loss of resonance, I found it to be the exception rather than the rule. Turning to the books, I find that Dr. Walshe, in his fourth edition (p. 548), says: "The gradual evacuation of the supplementary, and in some measure even of the residual, air which takes place in both lungs during the fit of asthma, slightly impairs the resonance on percussion." "This," says Dr. Walshe, "I repeatedly ascertained in a girl named Harmer, a hospital patient; but, on the whole, this sign is rarely to be established." Investigations of my own, with special reference to this question of impaired chest resonance during the asthmatic fit, make me agree with Dr. Walshe as to the sign being a rare one. The elastic wall of the pulmonary air-cell need not of necessity contract under the same influences that may determine a spasmodic stricture of the bronchial muscle. Remember the observation of Biermer, already noticed, as to how the bronchial muscle may form a sort of sphincter round the opening of the air-cell, and then we shall see that the simile, wherein the asthmatic lung is likened to a squeezed sponge, is not absolutely a correct one. I can understand how, as a result of contraction of the bronchial muscle, inspiration and expiration may both be impeded and imperfect. Generally, according to observation, and recent experiments of McGillivray, the expiratory act is the one specially impeded, the result of such impediment being over-distension of the air-cells, and the gradual development of emphysema. This over-distension of the air-ceils will also add to the cause of the tightness felt in the upper thorax, and will be the cause of the tympanitic, bandbox-like note elicited by percussing the chest wall. Lately a good deal has been said as to the inspiratory or expiratory character of the dyspnœa during a fit of spasmodic bronchial asthma, and this is a question well worthy of study in its bearing on certain modifications of the asthmatic paroxysm, as I hope shortly to show you. To me it appears that both respiratory acts are impeded more or less; sometimes inspiratory difficulty is most urgent, at other times, and in other cases, expiratory effort is pronounced and unmistakeable. My own reports of cases show me one group of patients who unhesitatingly refer their breath difficulty to the act of inspiration; others, among whom I am sorry to have to place an eminent member of our profession in a northern town, say that their sufferings during the paroxysm of asthma are so intense that they hardly can tell whether inspiration or expiration is most laborious. A third group, to be treated of more fully in another lecture, often spontaneously affirm that the desire they have is to get the air out of the chest rather than to get it in.

In proportion, generally, as lung emphysema is developed, so does the expiratory dyspnœa obtain the ascen-

(a) Delivered before the Medical Society of London. Erasmus Wilson, F.R.S., President in the Chair.

dancy. In young persons, where spasm is marked without much emphysema, inspiratory dyspnœa is often most severe and distressing; and not long since I saw in the case of a middle-aged man, who had long been afflicted with most severe attacks of almost asphyxiating asthma, a good example of inspiratory dyspnœa. "Decidedly," said he, "my difficulty is inspiring."

In this case I observed thoracic distension was in no way marked, and on listening to his chest six hours after one of his very bad attacks, I could hear no sibilant expiratory wheezings, and expiration seemed free. I further noticed that the percussion resonance did not come up to the normal standard of clearness, and this imperfect resonance of chest after a fit was remarked on by the patient himself. I have been struck with the fact, just exemplified, that on examining the chests of patients of the class described, where inspiratory distress is intense, and chest distension by no means marked, I have failed on the day following a bad night of asthma, to find about the chest any of that prolonged sonoro-sibilant expiration with which we are so familiar when we listen to the chest of an asthmatic shortly after his fit. Another point I have investigated, is the position of the diaphragm in these cases, and have found it to be drawn up rather than pressed down. The shoulders of the patient are nearly always high, for the thorax is drawn powerfully up by the muscles of inspiration. The normal movement of the ribs outwards and forwards does not take place, so that true divergence of ribs and expansion movement is not appreciated by the applied fingers. I purpose soon, after I have read the notes of a case, to return more fully to these points; meantime I would observe how a great inspiratory effort can be made by drawing up of the thorax in the way just described; and also how a similar effort can be made of a more abdominal character, in the performance of which the diaphragm descends and the abdomen protrudes, but in this last effort the lung must be fully expanded, and if dyspnœa occur it will be more of an expiratory than of an inspiratory character.

I certainly think that either of these conditions of thorax and abdomen may obtain in cases of asthma. In each case the muscles of inspiration act to aid the elastic resilience of the chest wall, which Dr. Douglas Powell has so cleverly demonstrated as the active force of ordinary tranquil inspiration. The embarrassed breathing and asthma are due to want of corresponding action between the lungs and the thorax. The lungs are in arrest of action, and in the first case, where chest and diaphragm are drawn up, the air is in a great measure evacuated from the lower part of the lungs, and is kept out by the bronchial stricture; hence the straining inspiratory effort, while the pulmonary spasm causes a sense of tightness or tearing in the upper chest, and here, indeed, air may be held pressed into the apices of the lungs, just as it is pressed into these parts by the violent expiratory efforts of coughing. In the other case, where the diaphragm is down, and chest over-full with air, we get very prolonged expiratory wheezings, the bronchial spasm retarding expiration. As I have said, I shall hope shortly to follow these views a little further; being desirous now of placing them as simply as I can, I make no reference to imperfect aeration of blood in the lungs as a possible cause of determining, in a reflex way, powerful inspiratory efforts; and speaking of inspiratory difficulty, I of course exclude all laryngeal or tracheal disease in the way of congestion or chronic stenosis of these parts. I have endeavoured by an analysis of the notes of a number of cases to illustrate the varying conditions of the chest and abdomen during the asthmatic fit, and thus to explain how it is that authors differ so decidedly in the descriptions they give of the state of the thorax during such fit.

This same impression of want of unanimity of description seems to have been made on the mind of Dr. Berkart, the most recent writer on asthma, and he has placed the various descriptions so well together that I cannot do better than quote them just as they are given, with the authorities,

| | |
|---|---|
| Respiration retarded to from 9 to 7 per minute.—Salter, 77. | Respiration augmented to 40, 60, or 80 per minute.—Caustatt, Ferrus, Wunderlich (J. C. Thorowgood). |
| The lungs are unusually collapsed within the thoracic cavity, and the parietes drawn in.—Williams, 91. | The chest remains distended, its walls are kept fixed in the extreme inspiratory position, such enlargement involving all the diameters of the thorax.—Salter, 76. |
| Inspiration is difficult; expiration, short, easy, superficial.—Bergson. | Expiration mainly is impeded, the patient labours 4 to 5 seconds to empty his chest.—Biermer. |
| Thorax sounds dull on percussion.—Williams. | Percussion induces a hyperresonant note.—Biermer. |

While inspiration (Ziemssen, iv., 562) shows nothing that varies from an ordinary powerful and somewhat forced effort, expiration presents the picture of a most laborious and tormenting, and, at the same time, fruitless struggle.—Bamberger.

Inspiration is violent and painfully ineffective; expiration is much prolonged, but unaccompanied with notable anguish.—Walshe.

Some observers, I find, speak of the abdomen as distended, others, as retracted; the fact being, as I take it, that sometimes one condition, sometimes the other obtains.

I remember, some ten or twelve years ago, when first my interest in the nature of the asthmatic paroxysm was aroused, thinking that sufficient attention had not been paid to the part taken by the diaphragm in the mechanism of asthma. That this muscle is much concerned in the dyspnœa of old emphysematous persons, I fully believe, but I cannot agree with Wintrich and Bamberger, who deny the influence of bronchial stricture in producing asthma, and attribute the seizure to tonic spasm of the diaphragm. True diaphragmatic spasm is seen best in some forms of hysteria, and it is marked by short hurried inspiration, short pause and rapid expiration. In a case of this description, shown to me by my clinical assistant, Mr. MacDonald, the respirations were as many as 80 in the minute, a short quick movement at the epigastrium was observed; auscultation revealed no abnormal sound. The patient was a young woman, and had had similar attacks before during the last few years. Bamberger believes, with Wintrich, that with a depressed position of the diaphragm there can be no bronchial stricture. Wintrich, moreover, says it is impossible to explain the enlargement of the lungs with increased air contents by a spasmodic contraction of the bronchial muscles. Bamberger further says that bronchial spasm is in the highest degree improbable, if not unimaginable, for in such case inspiration and expiration, especially the former, must be laborious and prolonged. Against these statements we have the fact, testified by several highly competent to judge, that inspiration and expiration in asthma are both very laborious acts; and we find Biermer stating, most correctly as I think, that a depressed condition of the diaphragm and acute pulmonary distension are quite compatible with bronchial spasm.

Acute pulmonary dilatation follows on acute obstruction, just as chronic pulmonary dilatation and emphysema follow on obstruction of air-tubes by old bronchial catarrh. (543, Ziemssen.)

Before I had an opportunity of studying the observations of the writers just quoted, I had given up my idea of diaphragmatic spasm as a cause of asthma, while I came to think that a kind of inertia, or partial paralysis, of the diaphragm, may have a good deal to do with the expiratory dyspnœa of old emphysematous persons.

From what I have observed in cases of spasmodic asthma coming on very suddenly, and sometimes brought on by some great expiratory effort, such as a fit of violent coughing or laughing, it seems that the thorax is drawn up and

fixed; but, on looking at the lower part of the thorax, quick, short, and very limited movement of the diaphragm and lower ribs may be observed, by which respiration is kept going and life maintained. The distress in these kind of cases, often met with in young persons, is markedly spasmodic and most severe, so that chloroform inhalation is often the only agent that gives effectual relief.

Allow me here to read before you my record of a typical case of this form of asthma :—

A young man in good health had his first attack of asthma take him quite suddenly after a fit of excessive laughter. Here was an example of spasmodic arrest of breathing after a complete expiration. On another occasion I saw this youth pass, in the course of two minutes, from sudden exposure to cold to the surface, into an intense and even alarming paroxysm of asthma, and during this seizure I noticed the state of the chest. There was great drawing up of clavicles and thorax, with fixation of these parts. The abdomen, at xiphoid cartilage, was powerfully retracted, and the diaphragm elevated. Respiration counted 64 per minute ; pulse, 110, very small. The breathing act seemed carried on by a slight, rapid, and very limited movement of the diaphragm and lower ribs. There was no laryngeal difficulty ; chest resonance, deficient in clearness ; expiration, wheezy, jerky, and prolonged ; inspiration, short, and quickly followed by inspiration. The inhalation of chloroform soon gave relief to the spasm, and the patient was released from his fixed bent position over a table which he assumed on the fit taking him.

This young man found, like many other cases that I have observed, that when he was able to cough and get up some mucus he felt better, and a pill of pil. hydrargyri and pulvis scillæ gave notable relief, apparently by promoting expectoration. Dr. Bree would explain this by saying "your pill fetches up the irritating mucus from the lungs, and so does good to the asthma;" others would very reasonably attribute the benefit derived from the pill to its relieving congestion of the bronchial mucous membrane. Against the exclusive truth of the theory of congested mucous membrane as the sole cause of dyspnœa, I would urge that the congestion and subsequent mucus flux result from the pressure put upon the capillary vessels by the spasm of the bronchial muscles. The great suddenness of the invasion of asthmatic dyspnœa, compelling the patient to leap from his bed and rush to the open window, and the speedy relief often afforded by inhaling the vapour of ether, or chloroform, or the smoke of burning tobacco or stramonium, point to nervous spasm rather than to acute congestion. The spasmodic constriction of the bronchial muscle induces stasis of circulation and congestion, and if flux and secretion can be determined, the patient feels much relief. Thus, I have often observed the spasm of asthma to subside when bronchitis comes on and causes free secretion ; and people say, "When I get bronchitis my asthma goes away." In the essential dynamic form of bronchial asthma, as illustrated in the case the notes of which I have just read, there is, to all appearance, as well as on the emphatic declaration of the patient, marked inspiratory dyspnœa. Seeing how often these intense fits of bronchial spasm follow on an exhaustive expiratory effort, one can comprehend the inspiratory character of the breath difficulty. Previous expiration has pumped the air out of the lower part of the lungs and forced some up into the apices, just as we see in the expiratory effort of coughing ; here this air is held, for the thorax is raised and drawn up in powerful inspiratory effort, and the tension in the upper chest becomes very distressing ; meantime, the retracted condition of the lower part of the lung causes the diaphragm to rise up with the thorax. Patients under the influence of this typical form of bronchial spasm have volunteered to me the statement that they feel as if their lungs were drawn up—drawn up to choke them, as Floyer used to say. A young man described his fit to me also in these words : "Cold air seems to draw together and contract my air-tubes, and then I pass into one of my bad fits ;" and the fits in this case were as intense as any I have met with, setting at defiance the best-planned remedies of numerous physicians. It is in the young we often see these very severe attacks of bronchial spasm. Dr. Fuller says that the most frightful paroxysm of asthma he ever saw was in a child, æt. 13. Salter describes an alarming attack in an infant not 2 years old, and I expect not uncommonly the bad pulmonary attacks of infants during dentition, if carefully investigated, would be found to have more of the element of spasm than of inflammation about them. The drawing up of the diaphragm was well exemplified in the instance of an asthmatic little boy who used to gasp out, "See how hollow I am," as he pointed to his retracted epigastrium. With respect to this elevation of the diaphragm, I find that Wood, of Philadelphia, describing a fit of asthma, says : "A hollow in the epigastrium is produced by the unusual elevation of the diaphragm, while expiration is much less difficult than inspiration." Walshe, too, already quoted, says : "Efforts at inspiration, convulsively violent and painfully ineffective, are accompanied, in the purely dynamic form of the disease, with sinking of the epigastrium, falling in of the lower part of the sternum, and elevation of the diaphragm. Expiration in these cases is prolonged, but unaccompanied by notable anguish."—(546, 4th edition.)

In these cases of asthma in young persons not due to whooping-cough or antecedent bronchitis, and very prone to come on after an expiratory effort, the prognosis should be favourable, for, though inspiratory spasm is alarming, with great sensation of internal constriction or cramp within the chest, yet the chance of co-existing emphysema is not great, and we may see in impairment of percussion, resonance, elevation of diaphragm, and absence of excessive chest distension, evidence on which to found a hopeful prognosis.

The fact that young people do grow out of this uncomplicated spasmodic asthma, or, better still, perhaps, that they can be cured of it, if it be due to some reflex irritation—as worms in the bowels, or enlarged bronchial or tracheal glands in the chest—shows that no high degree of emphysema can have been produced. "The asthma of children, says Riegel, often ceases spontaneously after a short time, or else at the period of puberty." (Ziemssen iv., 566.)

The theory of Lebert that the spasm beginning in the bronchial muscles, and thus narrowing the tubes, causes a great excess of inspiratory effort to force the air through the constricted bronchi, and then that this increased respiratory stimulus, reflected to the medulla and respiratory centres, induces reflex spasm of the diaphragm through the agency of the phrenic nerve, is ingenious and worthy of notice. The theory appears to accord with the fact that we see cases of what I call ingravescent or culminating asthma, slight at first, but getting gradually worse ; want of air increases till an actual state bordering on true apnœa is produced ; then come on most violent inspiratory efforts, and every auxiliary muscle is called into violent action. The power of these extreme inspiratory efforts was demonstrated by the experiments on asphyxia made before the Royal Medico-Chirurgical Society a few years ago. These facts show how wise it is to try and cut the asthmatic fit short *ab initio* by anti-spasmodic inhalation in the early stage.

The theory of Weber and Störck, already casually referred to, that asthma is due to tumefaction of the bronchial mucous membrane in consequence of dilatation of the blood-vessels by vaso-motor nervous influence, is full of interest and importance, especially in connection with certain varieties of asthma and catarrh, to be treated of in Lecture II. Störck says he has seen the mucous membrane of the larynx, trachea, and right bronchus in a state of hyperæmia during an attack of asthma. To see as much as this in the windpipe of an asthmatic during his fit reflects credit on the patience and perseverance of observer and observed, and I am inclined to think that anyone who can manage to keep the laryngeal mirror iat the throat of an asthmatic for but a short time will bn pretty sure to obtain evidence of congestive hyperæmiae

Be this as it may, there is the oft-made complaint of asthmatics of tightness and obstruction in the nose, the tendency often to profuse nasal flux, and the liability at times to the formation of mucous polypi in the nasal passages, all pointing to a congestive hyperæmia of these parts.

My reasons for believing the congestive hyperæmia and flux to be secondary effects of nervous spasm have been already set forth. Biermer, whose views on the nature of asthma seem to be fully in accord with the results of experiments and the observation of clinical facts, and who, like myself, is a supporter of the bronchial spasm theory, regards a fluxionary hyperæmia of the bronchial mucous membrane as quite a possible cause of asthma. (Ziemssen, 550.)

I agree in this, as in most other points, with the excellent observer just named, and, in considering the therapeutics of asthma, it is well to be mindful of the condition of bronchial hyperæmia, be it primary or secondary. Furthermore, it is of moment in therapeutics to recognise whether the disease be inspiratory or expiratory in rhythm.

Mr. President and Gentlemen, I must not encroach further on your kind attention this evening. The attempt to fulfil the conditions I set forth at the beginning of my lecture has not been so easy as I had anticipated, and I have been carried to a greater length in discoursing of the various theories of asthma than I had originally intended. I feel, however, bound to place fairly in review before you the more prominent of these theories as now taught and upheld by their several promulgators.

I will now conclude, and shall hope, in my next lecture, before proceeding to the pathological part of the question, to follow out a little further the subject of bronchial hyperæmia, congestion, and flux, in connection with certain interesting varieties of asthma, the prominent place among which will be assigned to hay asthma, or summer catarrh.

*(To be continued.)*

# Original Communications.

## ON PUERPERAL FEVER AND PUERPERAL SCARLATINA.

By Dr. G. de GORREQUER GRIFFITH,

Senior Physician to the Hospital for Diseases of Women and Children; Consulting Physician-Accoucheur to St. Saviour's Maternity.

Recently, in another journal, have communications on these affections appeared from Professor Playfair, and from Dr. Hicks and Mr. May, jun. Any contributions on such are especially welcome, but coming from eminent authorities, they are yet more acceptable.

Dr. Playfair, in reference to a case which he had under review, wrote :—

"There was a well marked eruption, *very analogous* to that of scarlet fever, but such rashes are common in septicæmia, quite independently of the origin of the disease."

I am glad to have the endorsement of so eminent a gynæcologist to the statements which I made at the Obstetrical Society during the great debate which took place in its rooms. That statement may best be summarised in the words of the then President, Dr. Priestley, who, in his masterly and judicial, as it were, summing up, said : "There is a fallacy in reference to the occurrence of scarlatina in the puerperal patient which must not be overlooked; as stated by Dr. G. de Gorrequer Griffith, there may be a rash closely *resembling the scarlet fever* eruption, which is due to toxæmic poisoning of another kind, and which may be mistaken for scarlatina !"

I believe I was the only Fellow, or speaker in the debate who directed attention to this important fact, and I would refer my readers to page 261 and following of "Obstetrical Transactions," vol. xvii. (1875) for the exact opinion I at that time enunciated. I also alluded to the fact, that in some of these cases of "bastard or simulative scarlatina," as I then termed them, there may even be desquamation, owing to the height to which the fever may run, not on account of there being any scarlatinal blood poisoning—such being actually not the case. Nor to my mind is this peeling of the skin at all pathognomonic or diagnostic of the scarlatina, using that name in its usually accepted significance. With this latter view Dr. Playfair is at issue, I know, judging by the words of the clinique to which I have already referred, for, he says :—"The fact, however, that subsequently to recovery, there was distinct desquamation about the fingers, and, to a less extent, in other parts of the body, makes me think it likely, that the scarlatinal poison was the origin of the illness."

I am sure when Dr. Playfair passes in mental review certain surgical and medical affections, which will readily rise to his mind, he will bear me out that scarlatinal poison is *not* necessary to desquamation ; but that greatly exalted temperature, especially if long continued, will of itself occasion this process without at all having any reference whatever to a special scarlatinal virus being present in the blood.

The recent lectures of Dr. Burdon Sanderson may be read with great advantage in connection with this subject, as bearing me out in the inferences of this paper. Yet, despite all the facts and experiences in the past, the diagnosis of these two perfectly distinct ailments, viz., true scarlatina, and the bastard, or simulative, resembling it in so very many particulars, seems shrouded with difficulty—in a great measure, I believe, because the *scarlet rash and other symptoms* of puerperal blood poisoning, or of toxæmia from other causes of blood-poisoning, do not seem to be recognised as such, and are confounded with true scarlet fever. Another hindrance is, because the sequela—desquamation—has been mistakenly looked upon as an *essential* consequence of true scarlatina, and of it alone. Some have seen and described true scarlet fever—running its regular course—the subject of it happening, in the chapter of accidents, as it might be said, to be the lying-in woman ; that fever, which is known by the name of puerperal, and is particularly characterised by offensive lochia and other uterine symptoms, not being induced. Others have seen after labour, symptoms, which they have considered to be those of scarlatina, but which were really not all that affection, being simply the outward and visible signs of that inward autogenetic poison of which, as the very word autogenetic implies, the woman is herself the factor (being developed in the womb, or some other part of the reproductive tract) and subsequently the recipient, being absorbed into the blood and entire system from the site where it was originally first generated.

The mode of this absorption by the lymphatics, the veins, the peritoneum, and the body generally, has been admirably shewn by Dr. Tilt in the 16th vol. of the "Obstetrical Transactions." With the symptoms (attendant upon toxæmic poisoning) closely simulating true scarlatina—and which have been so often mistaken for it—who, practising obstetrics, *or ordinary surgery*, is not acquainted ? But they are not at all the result of true scarlatina, assuming that disease to be a fever contracted by one person from another affected with it, or from something belonging to the infected, and become tainted with the virus, and capable thereby of propagating it ! There has been not even any exposure to scarlatina virus, yet all the symptoms, *resembling that disease*, will manifest themselves. Strict investigation will enable us to discover the presence *in utero*, or in the wound of the surgical patient, some putrid or noxious matter *in utero*, or some noisome offending material in the surgical wound, whereby the entire system has become tainted and the toxæmic symptoms —so like scarlatina proper—been developed. This fact will be demonstrated most clearly by the result of treatment ; for if the, what I will term, toxæmic symptoms be mistaken for scarlatina, and treated accordingly, you will

be likely to lose your patient, or to permit her to fall into a very precarious state; whereas, if the true source of the affection be recognised, and the offending elements be washed away early, and the cleansing process be maintained, the patient will, in all human probability do well.

In narrating those cases in which scarlet fever symptoms have declared themselves in the lying-in woman, it should always be recorded whether the lochia had been offensive before the scarlet fever symptoms showed themselves. If not, and that there be no offensiveness throughout, nor any uterine symptoms, then the diagnosis would be that scarlatina proper were present; and if, perchance, the lochia did become unduly offensive, subsequent to the irruption of the other symptoms, I should consider that they had done so, owing to the scarlatina virus perverting the entire blood, vitiating the outcome of it, viz., the lochia, the relation of the fever to the offensive lochia, and perhaps other uterine morbid manifestations, being as cause and effect—the very reverse of that which obtains when the symptoms arise from autogenetic puerperal, or any surgical toxæmia—symptoms to which I have applied the name "false, bastard, or simulative scarlet fever."

In the way I have just described, scarlet fever may, when attacking the lying-in woman, run into puerperal fever by the lighting up in the reproductive parts of those local conditions essential to true puerperal fever—reproductive parts where open, or recently open vessels lie, and where ruptures, abrasions and such like are exposed, and readily unhealthily altered and vitiated. That skin desquamation is no distinctive sign of the existence, or pre-existence in the system of the true scarlatina virus, I have only to assert, in order to carry with me the authority and sanction of every experienced physician and surgeon.

Furthermore, it is well established that there are cases of toxæmia or septicæmia, running on to so rapidly a fatal issue from, as it were, an overwhelming dose of the poison, that the febrile symptoms have not even time to be noticed, or perhaps even developed, so speedily quenched is the patient with the deadliness of the quality, or quantity, or both, of the blood poison.

The above thoughts have been suggested to me by a case of autogenetic puerperal blood-poisoning which occurred in my practice some time ago; and by experience accumulated since that time. In the person of that patient most, if not all, the symptoms of true scarlatina existed; but recognising them to be *wholly* due to a morbid condition of the lochia and perverted state of the entire uterine system, I treated them accordingly, and, happily, with the best possible results. I laid my hand on the soft, spongy, uncontracted womb, and, imitating the eliminative action of that organ, by alternately grasping it and relaxing my hold, some foul clots were expelled, the womb and vagina being subsequently well washed out by means of Higginson's syringe, Condy and warm water being employed, and the ablution repeated every few hours—as the patient's condition permitted—till the lochia became quite inodorous, the internal treatment being in accordance and based upon my diagnosis of the *origo mali*. Had I, however, seen the patient for the first time when the symptoms—apparently scarlatinal—were at their height, and well developed, I might have erred in supposing I had a case of scarlet fever to combat, have treated it as such, and, most likely, have lost my patient. But being alive to the puerperal facts of the case, I at once proceeded to deal with it, as I have described, and the correctness of the judgment and diagnosis, was evinced by the immediate improvement, commencing, as it did, from the very time the offensive clots were expelled, and the lochia washed away, and by the ulterior permanent good effects.

All the group of evils in this case, viewed cursorily, might well have been termed scarlatina, or have been set down to that ailment; yet, *all at once*, disappearing under the uterine cleansing treatment, showed incontestably that the diagnosis was correct. Moreover, every inquiry was made to ascertain whether there had been any exposure to scarlatina, or whether there had been any known occurrence of it in the neighbourhood, or in any place where she had been, or, indeed, in any way where she might have been brought into contact with the disease; but the inquiries could lead to no such evidences—rather the contrary.

Here I would parenthetically allude to Dr. Seaton and Mr. Howie's reference to the fact that typhus and typhoid have sometimes been pronounced septicæmia, and I would quote the opinion to which I gave expression at the great Obstetrical debate:—

"My mind has been exercised upon what I consider to be a fact, namely, that scarlet fever and typhoid may originate in the same way—that is, from the same infecting sources; that the poison or contagium may, in fact, be the same, developed and matured *in different* persons, or in the same persons *at different* times, and under *different* circumstances, the poison at one time, and in one set of patients, determining to, and having an affinity for, certain parts of the system, such as we find involved in scarlet fever, to which, accordingly, we give that distinctive term; the *same* poison, affecting *another* set of persons, or the *same set* of people at another time, and under *other* circumstances, and determining to the intestines, particularly to Peyer's patches, and occasioning what we term typhoid."

In this I am borne out by the independent researches of Dr. John Harley and Dr. Tilt. And bearing in mind the life or clinical symptoms which exist in scarlet fever, puerperal, and typhoid, as also the pathological conditions (found after death), and how closely they both, in a great many instances, resemble each other, I would almost say how nearly allied they are, how much alike, if not in many instances actually so—bearing, I say, these facts in mind, I can understand how readily the one fever may run into the other, and why the eminent Irish physician, Sir Henry Marsh, came to consider that typhoid may originate puerperal fever; and, finally, how, without the greatest care, bastard scarlet fever, being developed in the lying-in woman, may be mistaken for true scarlatina, the bastard simulative symptoms being really the outcome of the septicæmia, or toxæmia, which, commencing or having its seat in the womb may, at least in the earlier stages, be best got rid of from the patient by being expelled and washed out from the womb in the way I have pointed out; how puerperal, or ordinary surgical blood-poisoning, may come to be mistaken for scarlet fever, treatment consequently erroneously applied, and the patient lost, or very nearly so—certainly very much damaged on account of the error in diagnosis.

## NOTES ON THE REDUCTION OF CERTAIN DISLOCATIONS. (a)

By J. E. KELLY, L.R.C.S.I.,

Surgeon to Jervis Street Hospital, and Lecturer on Anatomy and Physiology at the Ledwich School, Dublin.

In the following notes, which I selected to read to-night before this Society, I wish to submit certain expedients, which in cases presenting peculiar features, I have found useful. It is with reluctance that I add to the numerous methods proposed for the reduction of luxations, but my excuse lies in the fact that I have tested them; they are extremely simple, and require no apparatus whatsoever.

I shall relate a case in which a very simple expedient superseded anæsthesia by removing muscular resistance. A powerful sailor was admitted to the Jervis Street Hospital with a sub-glenoid dislocation of the humerus. He had serious valvular disease, and additional circumstances rendered chloroform undesirable. The accident occurred at sea, and was of several days' duration. Rotation, manipulation, and extension in various directions proved ineffectual, until it struck me that the muscular resistance

(a) Read before the Surgical Society of Ireland.

might be easily evaded. I took a pupil aside, and arming him with a cold wet towel, I directed him at a signal to slap the patient suddenly on the epigastrium. I placed my heel in the axilla, as I had done several times previously, and gave the signal. The patient made a sudden and complete expiratory effort, and with very little extension the bone was replaced. Thus, by producing collapse of the thorax, the basis of muscular force, voluntary and spasmodic resistance may frequently be overcome.

I shall now describe a method of applying the muscular force of the operator to a dislocated humerus, which renders him independent of assistance by increasing to the fullest his power, while it economises his grasp. A patient was thrown from his horse, and suffered an intra-coracoid dislocation. He was put fully under the influence of chloroform, and, with the exception of the pulley, every method, with ample assistance, proved unsuccessful. Almost in despair, I placed the patient on a bed, with the dislocated limb on the outside, and close to the edge. I turned my back to him, and got one trochanter well into his axilla. I brought the dislocated humerus across the front of my pelvis, and hitched or flexed the fore-arm round the opposite ilium. By a single torsion or twist of my trunk, produced by some of its most powerful muscles, I made extension and abduction, while the weight of the patient afforded ample counter-extension. I was surprised by the ease with which reduction was effected on this and several subsequent occasions, with and without the assistance of anæsthesia. When the displacement is inferior, I find it more advantageous to lie across the patient while on the ground, and then to make the same movement. In applying this method, one hand is disengaged, and may be used to manipulate the joint, if it be necessary.

Rotation of a dislocated bone on its axis is often of great benefit. I shall give two examples. In anterior luxations of the humerus I have sometimes found it advantageous to extend the arm to a right angle with the body; to rotate the limb inwards until the postero-inferior edge of the articular surface of the head of the humerus approaches the anterior margin of the glenoid cavity; to place the hand, or the heel, over the head of the bone, and to apply and maintain extension, while the arm is made describe an arc until it reaches the side. This manœuvre is best performed while the patient lies on a low couch. The other example of rotation which I shall give is in Hey's luxation of the thumb. Here the difficulty of reduction is due to the lateral ligaments and the associated structures being attached to portions of the bones of less diameter than the articular ends. Consequently, when the latter are displaced from between the ligaments, these run directly between their points of attachment and separate the articular surfaces, which exceed in transverse diameter the space now intervening between the ligaments. Extension merely lessens the inter-ligamentous space, while if the dislocated phalanx be rotated forcibly and lateralised, so as to bring one extremity of the articular surface towards the centre of the space, the luxation may be reduced with the greatest facility after the most violent extension has signally failed.

My last observations to-night will refer to femoral luxations, and I shall abbreviate them best by describing a case of posterior luxation, which occurred in a very Hercules. After manipulation, circumduction, extension by pulleys and triangles had failed, and the collective wisdom of several experienced surgeons had been set at naught, the following manœuvre was successful: The patient was placed on his back upon the floor, and his pelvis firmly fixed; I flexed his hip and knee, and placed his instep under my perinæum; bending forward, I passed my fore-arms under his knee, and grasped my elbows. Then bringing the dorsal muscles with those of the lower extremities into action, I reduced the dislocation with little difficulty.

Thus it is possible to apply a force varying from 300 to 800 lbs. in a manner easily regulated, while the surgeon's grasp is not taxed. Considerable circumduction may be combined with the force by swaying over the patient during the effort of extension.

Mr. McNamara—Mr. Kelly's plan of reducing a dislocation of the hip I consider of a most important and practical character. I would like to show one that succeeded admirably in the case of one of the hardest-hunting gentlemen I ever knew: he hunted six days in the week. The patient was placed on his back. I drew the dislocated limb over my shoulder, flexed it at the knee-joint, the leg being in front of my body, and his pelvis at the same time fixed. By raising the limb, rotating my body, and keeping the knee flexed down in front, I was able to reduce the dislocation with the greatest facility.

Both Prof. McNamara and Mr. Kelly demonstrated their respective methods.

# Clinical Records.

## MERCER'S HOSPITAL, DUBLIN.

Under the care of Mr. E. STAMER O'GRADY,
Surgeon to the Hospital.

Amongst the patients under the care of Mr. E. Stamer O'Grady whose cases came to a conclusion during the past month (December), were the following:—

*Amputation of Thigh (Two Cases).*

*A.* On a male child, æt. 3, whose left limb had been run over by a loaded float, the accident completely denuding of integument the front and both lateral aspects of the limb for some distance above and below the knee. The popliteal space was freely opened, the artery being torn up and displaced with the soft parts. The wound measured nine inches in length. There was no tangible bone injury. The detached and damaged skin for the most part sloughed. When the dead portions separated the continuity of the integument of leg and thigh was merely by a narrow posterior band, in places only one inch in breadth. During a prolonged treatment every trial was made by the most careful dressings, skin grafting, &c., to induce cicatrisation, but no sustained effort at repair was obtained, all such attempts being feeble, transient, and abortive. Eventually a slight erysipeloid attack occurred, leaving the already enfeebled child in a condition of much prostration and rapidly running down. The ulcerated surface was now of very unhealthy character, and larger than the original wound. As a *dernier ressort* amputation was performed exactly three months subsequent to the accident; a modified circular operation best met existing emergencies, the incision for a considerable extent skirting the ulcer, being prolonged upwards in a $\Lambda$ form on the inside, where a long projecting tongue of ulcer stretched in the direction of the perinæum. A shapely stump was thus obtained, the section of the bone being sub-trochanteric. Scarcely any blood was lost; at the time only two vessels required ligature, but as reaction came on, three more had to be tied, each being secured as it began to weep on the face of the carefully watched open stump. Almost total suppression of urine followed the operation. This yielded to treatment. The returning secretion was at first heavily charged with albumen, but this entirely disappeared after a few days. Subsequent to the operation the child seemed notably to improve, the progress of the stump, too, was on the whole favourable. A limited fringe of sloughing formed on the anterior and lateral portions. This duly began to separate, and the wound to clean and look well. The eighth day after the amputation was one of extreme inclemency. Just before a heavy fall of snow the vital powers of the child became suddenly and markedly depressed. He responded to stimulants,

but a second similar seizure took place in the afternoon. During this, death occurred very suddenly. The result could not be attributable to local chill; there had been no exposure, and the patient's bed was in a sheltered position near a good fire. The fatal issue coming as it did was unexpected; unpromising as the case had been there latterly seemed to be a fair prospect of recovery.

*B.* An anæmic girl, æt. 22, in bad health, the subject of knee disease for fourteen years, resulting in dislocated joint, with a limb two and a half inches shorter than its fellow. The amputation was by long anterior and short posterior rectangular flaps. A periosteal curtain was preserved; seven vessels were tied. Notwithstanding the enfeebled condition of the patient, in ten days the wound had made considerable progress towards repair, and was healed in another fortnight. An abscess subsequently formed in the stump and delayed the discharge of the patient.

In both the preceding cases the operation wound was well dabbed with a solution (40 grs. to the ounce) of chloride of zinc, and in each provision was made for drainage—in *A.* from the angles, in *B.* from the centre of the wound.

*Three Hydroceles co-existing.*—Patient, a man, æt. 70, had, in addition to considerable effusion into each tunica vaginalis, also a separate hydrocele the size of a small orange situated high up on the cord, on the right side. Each collection was tapped.

*Circumcision for Phymosis.*—Patient, æt. 23. Disease acquired, the preputial orifice being cicatrised into a mere pin's point. Ricord's operation performed in the ordinary way. Without any obvious cause for such existing the wound healed but slowly, the patient not leaving hospital for twelve days.

*Wound of Vulva.*—A girl, æt. 12, injured the pudenda by falling astride a chair. There was severe hæmorrhage, which was arrested by pressure of plugs of lint moistened with muriate tincture of iron. When visited the day after the accident but little appearance of a wound existed; the parts healed rapidly, the girl being able to leave the hospital after a stay of five days.

*Compound Fracture of Leg.*—A groom, æt. 42, whilst riding a horse was kicked by another animal, the stroke breaking both bones of the right leg a little below the centre, the lesion in the tibia being compound. The wound was slow to cicatrise, subsequently thereto ossification proceeded, and the patient was discharged after a stay of eighty-four days with a well solidified and useful limb. There was slight angular deformity, consequent on the uncontrollable habit of the patient to meddle with the dressings.

*Injury of Spinal Cord.*—A man, æt. 28, stated to have been run over "the small of the back" by a car. When brought to the hospital, immediately after the occurrence of the accident, there was complete paralysis of the lower limbs both as to sensation and motion. There was no priapism. Examination could not detect any local displacement along the region of the spine. After a couple of days sensation and the power of slightly moving the limbs began to return, but improvement was very slowly progressive, and when the patient left the hospital (which he did against advice), he was only able to walk in a peculiar shuffling fashion, supporting himself by leaning on the back of a chair which he pushed before him.

*Amputation of Finger at Metacarpo-phalangeal Articulation (Two Cases.)*

*A. Wound of Radial—Dry Gangrene of Middle Finger.*—A lad, of soft flabby tissues, wounded the radial about one inch above the wrist with a broken decanter. Of four spouting vessels three were secured by ligature; the fourth, and largest, could only be staunched by leaving the tenaculum *in situ* in the wound, and doubling down the instrument along the forearm. Dry gangrene of the middle finger followed, the affection being perfectly typical. The line of demarcation, situated about the centre of the proximal phalanx, was slow to form. Fifty days after the accident, the finger was disarticulated. The operation and accident wounds but slowly repaired, not being entirely healed till seventy-four days after the accident.

*B. Cog-Wheel Compound Fracture — Disarticulation Middle Finger.*—A lad, æt. 14, got the left hand entangled in machinery at a bookbindery; the middle finger being so badly smashed as to require removal of the metacarpo-phalangeal articulation. A good deal of diffuse inflammation of hand and forearm followed, but the case progressed favourably; the boy being able to leave the hospital in a fortnight.

*Stricture of Urethra—Internal Urethrotomy* (Maisonneuve).—Patient, a seafaring man, æt. 38, was the subject of double stricture; the first constriction situated an inch down the canal; the other, immediately in front of the membranous portion. The sections were made anteriorly (*i.e.*, with an instrument, the cutting blade of which ran on the concavity of the guide), nothing noteworthy presented at the time of the operation, but soon afterwards, when the patient desired to micturate, he passed a large quantity of blood. For several hours the bleeding continued to be persistent, and very free, apparently unchecked by local application of cold and pressure both with and without the use of a full sized catheter. Ergot, iron, and subsequently gallic acid in very large doses were given internally, but it was not till after the bleeding had excited considerable apprehension that the flow began to abate. The patient then did excellently, and left the hospital ten days after the operation quite free from local trouble, No 12 catheter passing easily.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, JAN. 24.

Dr. GREENHOW, President, in the Chair.

The PRESIDENT, in the course of his address, took occasion to thank the members of the Society for the honour they had conferred upon him in electing him to a post which had been filled by so many able predecessors. The number of members and the balance-sheet attested the prosperity of the Society, while the volumes of the "Transactions" gave evidence of the valuable work which it had accomplished. Looking back to its early history, he pointed out how much of its success was due to its first Secretary, Dr. Sanderson. Amongst the cases of greatest importance he alluded to several papers on deaths from high temperature in rheumatism; on icthyosis of the tongue, followed by epithelioma; on the disease produced by infection from grease in the horse, and others; whilst in surgery, the cases of aneurism treated by distal ligature, related by Dr. Cockle, Mr. Heath, and Mr. Holmes, seemed specially deserving of notice. The therapeutical value of condurango and nitrite of amyl had been particularly examined. Committees had been appointed to report upon the incubation period of certain acute and specific diseases, the temperature in syphilis, the effect of quinine as an anti-pyretic, and the results of a prolonged use of chloral. He was in favour of extending this method of investigation (by a committee) of doubtful points in therapeutics and etiology, and trusted that the Clinical Society would long continue its labours for the glory of God, and the relief of man's estate.

A vote of thanks to the President, and a request that he would allow his address to be printed, was proposed by Dr. SOUTHEY, and seconded by Mr. LANGTON, and adopted unanimously.

Dr. SOUTHEY read the notes of

A CASE OF PLEURITIC EFFUSION IN WHICH THE LEFT THORAX WAS DRAINED BY A FINE CANULA AND CAPILLARY TUBE.

The patient, a carman, æt. 23, of average build, height, and weight, was admitted into St. Bartholomew's Hospital with the ordinary symptoms of pleurisy with effusion upon the left side, of about nine days' duration. He kept to his work until the day before admission to the hospital, and walked upstairs to his ward. On admission his temperature was 102·2, respiration 24, pulse 80, cough was slight, and the usual symptoms of feverishness. There was absolute dulness of the left lung in front and laterally, and posteriorly as high as the root of the lung, general absence of respiratory sounds on the left side, and increased breathing of the right lung. The patient was ordered an effervescing draught of tartrate of soda with nitrate of potash 10 grains, and tincture of digitalis 10 minims, every four hours; and a draught containing one-sixth of a grain of morphia at bedtime, if required for sleeplessness or pain. On the second day after admission, the feverish symptoms were scarcely changed, the nights were restless, there was frequent cough, and the urine scarcely averaged 20 ounces per diem. The dulness over the left lung extended higher up posteriorly. On the following day one of Dr. Southey's fine canulæ was introduced into the left pleural cavity in the fifth intercostal space in the mid-axillary perpendicular. Clear serous fluid escaped, and was conducted by a capillary drainage-tube to a jar beneath the bed. The lad fainted directly the tube was introduced. It remained *in situ* for 28 hours, hurting a little, and was then removed. Four pints of pleuritic fluid, sp. gr. 1020, were drained away. The left side was then less dull on percussion; a loud friction rub was audible in front and behind, and bronchial breathing in front, at the side, and behind. There were thus abundant signs of lung expansion. On the night after the operation the lad had a morphia draught and slept well, and in the first 24 hours passed 2½ pints of urine, of sp. gr. 1019. The next day the same quantity passed, and on the following day as much as 5¾ pints, of sp. gr. 1022. The daily quantity of urine dmring the next ten days varied from 45 to 75 ounces. The saline mixture with digitalis was continued, and full diet with four ounces of wine was given. The temperature gradually fell until it reached the normal range on the fourteenth day after the operation, when the respiratory sounds of the affected lung were all still improving. He left the hospital on the thirty-second day after operation, the left shoulder was then slightly dropped. The percussion note was good at apex, front, as low as the fifth rib, the axilla, and to the angle of the scapula behind; there was dulness over a hand's breadth at the base of the lung laterally and behind. A rough leathery friction sound was audible in the left supra-scapular, intra-scapular, axillary, lateral and infra-mammary regions. The cardiac sounds were normal. Dr. Southey remarked that not a tinge of blood came at any time through the canula; that the side had not been emptied, but simply relieved, and that the renal secretion immediately was more than doubled. He had now tapped the chest five times in this manner, once drawing off nearly twenty ounces of purulent fluid, without any complication or accident, and he commended the proceeding for adoption in the hydro-thorax of scarlatinal dropsy, as well as in any pleuritic effusion, when the temperature remained high, and the urine became progressively scantier day by day. Dr. Southy exhibited the last and best form of his fine drainage trochar and canula suitable for paracentesis abdominis, or thoracis, or the draining of anasarcous legs. The trochar would adapt itself to different lengths of canula by means of a crotchet needle screwholder. The instrument would hold two sets or sizes of trochars and canulæ. A fixed shield was adapted to it, and held the canula *in situ* when it was used through the abdominal or thoracic walls. Dr. Southey had used the instrument in twenty or thirty cases of paracentesis abdominis without any untoward result. Messrs. Fergusson's foreman had gradually improved the instrument for Dr. Southey's trials, and it now seemed quite satisfactory.

Dr. YEO asked whether there was not some danger of producing a fistula by this retention of a small tube in the chest—a result which had followed in the case under discussion—and whether Dr. Southey considered that any real relation existed between the excessive secretion of urine in this case, and his method of relieving the pleura. Judging by the friction sound, the fluid appeared to have been mostly removed by the drainage tube.

Dr. WILLIAMS wished to learn whether the drugs were omitted after the operation. Perhaps these might account for the increased secretion from the kidneys. And also to learn Dr. Southey's experience as to the character of the voice-sounds heard after the withdrawal of a moderate amount of fluid.

Dr. D. POWELL supposed that it was hardly proposed to use such a fine trocar in the treatment of an empyema. It was, no doubt, of value in anasarca, but he thought that in simple effusion the same result might be safely obtained in a shorter time in the usual operations. Was it not probable that the amount of urine secreted here depended on emotional causes?

Dr. GREENHOW considered that the return of friction after tapping was frequently met with.

Mr. HUTCHINSON wished for a little more detail as to the therapeutical measures adopted. It appeared to him that physicians were now in the habit of having recourse to surgical measures, while surgeons were relying more and more upon drugs. He believed himself in the advantage of mercury, iodide of potassium, and counter-irritants, in such cases as these.

Mr. PARKER could hardly regard this method as expeditious or convenient; and noticed that in children the fainting which had followed the puncture was extremely uncommon.

Dr. SOUTHEY agreed that this effect was more frequent in adults; the disadvantage of an aspirator was that it so frequently caused some extravasation. Here the seat of the friction was, he thought, important, for it was heard at the back and side. Digitalis and nitrate of potash were continued throughout, and the urine maintained a sp. gr. of 1022. Even pus would find its way freely out of such a small canula, but he did not recommend this operation for an undoubted empyema.

Dr. ALTHAUS on

A CASE OF DISEASE OF THE SPINAL ACCESSORY NERVE.

The patient was a married lady, æt. 53, in whom spasm of the sterno-cleido-mastoid and trapezius muscles of the left side had come on apparently in consequence of mental anxiety. The spasm was incessant, the patient being unable to keep the head steady for a single instant. The head was chiefly pulled to the side and backwards, while the top of the shoulder was raised and the shoulder-blade approached the spine; but there was also nodding of the head, the ear being approached to the collar-bone, the occiput depressed, and the chin raised and directed to the opposite side. Muscular rest was only obtained during sleep, but the jactitation commenced again on waking in the morning. The patient was, in consequence of this, utterly disabled from following her usual occupations, and the general health suffered, but there was no trace of any other disease. The treatment consisted of the application of the voltaic current to the suffering nerve, the internal use of bromide of potassium, cannabis indica, and belladonna, subcutaneous injections of arsenic and morphia, and external use of chloroform liniment; but this treatment remained ineffectual, although some temporary relief was afforded. Dr Althaus did not think that there was any structural disease, but that the change in the nervous matter was molecular. In other cases which had come under his notice the result of the treatment had also been unfavourable; but seeing that good results have followed the operation of nerve-stretching in other spasmodic affections, he suggested stretching of the spinal accessory nerve for any obstinate case in which the patient might be determined to seek relief.

Dr. STURGE had seen five cases of this disease, one was associated with disseminated sclerosis; the same change had probably involved the root of the spinal accessory; in another the torticollis depended on the state of the general health, and was not affected by drugs. Others he had seen where spasm of the arm of the affected side had appeared. In these treatment was of no effect.

Mr. M. BAKER referred to a case under his charge where he had proposed to divide the spinal accessory nerve.

Mr. PARKER said that this case had eventually come under the care of Mr. Rivington, a part of the nerve had been excised, but the case terminated unfortunately; examined microscopically the nerve presented an increase of vascularity, and signs of sclerosis,

Dr. TAYLOR had treated a case of three months' duration with the constant current, and with pot. bromid; there had been considerable improvement, though not so perfect a result as in a case related by Dr. Poore.

Dr. MAHOMED asked whether the platysma was affected. In a patient in Guy's Hospital some relief had followed the use of constant current.

Dr. ALTHAUS said that there was no affection of the platysma, no sign of sclerosis, and no tendency to spread to the arm in his patient. Improvement was rare and he thought only occurred in younger people.

The meeting then adjourned.

# Department of Lunacy.

## PRIVATE ASYLUMS AS OPPOSED TO SINGLE CARE.

AT the present day all asylums are under the constant supervision of Government officials. Metropolitan licensed houses are visited 6 times during the year by the Commissioners in Lunacy, provincial licensed houses twice by the Commissioners and four times by a special board of visitors appointed for this purpose; county asylums are visited once by the Commissioners, and also by a committee under whose management and control they are; hospitals for the insane, such as Bethlem and St. Luke's, are also inspected by the Commissioners in Lunacy, as well as by a weekly board of visitors. Many of the agitators on lunacy reform seem to forget that all asylums are so visited, and that consequently it is impossible under the existing system of visitation for there to be a possibility of illegal detention in asylums. Most extraordinary statements have appeared in one of our contemporaries in an article entitled "Lunacy Law Reform," followed by another on "Asylumdom." The remarks are either those of an inexperienced person in lunacy practice, or are made by one anxious to serve his own purpose. They are written in a spirit and a tone which cannot be influenced by any good feeling towards his professional brethren.

Of course there is a diversity of opinion on the advisability of placing patients under private care, and away from asylum life. The Commissioners in Lunacy are, however, decidedly opposed to single patients. The opinion, as expressed by them, is that patients are far better off when resident in well managed asylums than when left to the care of any one individual. Admitting the utility of private care in the case of some chronic lunatics, we must not lose sight of the great superiority of asylums, and the advantages which they offer in curable cases. The Commissioners in Lunacy have always advocated this, and Griesinger says that in an asylum a patient finds a place where his eccentric behaviour is concealed from over-officious eyes, where the necessary surveillance is accorded him without any obtrusive show or any other treatment on the part of those in authority which may be repugnant to any sensitive person; and where he can enjoy the greater amount of his personal liberty without let or hindrance, and more liberty of action than he could possibly have were his freedom curtailed in any other way. In an article we published on Nov. 20 we advocated these views, and drew attention to the great advantages of private asylums over public institutions.

Millingen, in his "Aphorisms on Insanity," when speaking of patients under private care, says that many of them are left to the entire supervision of attendants, who, when they are sure that there is no probability of their being detected, will lock the patient in his room and adjourn to the nearest public house. What he thus wrote many years ago is applicable at the present day; human nature has not changed since Millingen's time, and it is to be reasonably imagined that chronic cases who are unable to protect themselves by making complaints stand a very good chance of being treated in a like manner, and subjected to gross neglect. Single patients are not under the same stringent supervision as when in asylums as regards the visitation by the Commissioners in Lunacy; consequently the liberty of the subject is more in danger. We state it emphatically—that there are many lunatics residing with their friends and others, who are liable to be neglected; and we wish to draw especial attention to pauper imbeciles under the supposed charge of their relatives. If Harriet Staunton had been placed in a proper institution, where she could have been looked after, and not left to the mercy of her friends, who were conscious that she was mentally incapable of resisting by her complaints ill-treatment and neglect, we should never have heard of the Penge mystery and of its revelations.

## REGINA *v.* MULLENS.

IF another illustration were needed of the anomalous condition of the English law with regard to insanity and criminal responsibility, it is to be found in the recent trial of William Mullens for threatening to murder the Assistant-Secretary to the Board of Trade.

Here is a man whose whole career has been an antagonism between himself and constituted authorities; who has been confined in various lunatic asylums and prisons; who by look, word, and gesture betrayed to everyone at the Old Bailey his mental unsoundness—found guilty by the jury, against their better judgment, of the crime with which he was charged, simply because two medical witnesses said that, though insane, the prisoner knew right from wrong.

William Mullens had previously been under Dr. Sheppard's care in Colney Hatch Asylum, and had escaped therefrom by a skeleton key of his own ingenious construction. The same physician, in conjunction with Mr. Gibson, the prison surgeon, had interviewed William Mullens for nearly three hours in Newgate, and sent a written report to the Treasury that he was of unsound mind.

Whilst an architect's evidence as to the structural unsoundness of a building would unhesitatingly be accepted, a doctor's evidence as to the mental unsoundness of an individual is deliberately set at nought, because in the latter case the judges take upon themselves to decide what mental unsoundness really is in reference to criminal responsibility. It is of no consequence, they lay it down, what specialists, who have made a study of mind, say about the mind and its morbid conditions. So long as an individual knows right from wrong you must burden him with the responsibility attached to wrong doing.

It was really curious in the trial under consideration to notice the bewildered condition of the jury. They knew, as every body in court knew, except Mrs. Weldon, that Mullens was of unsound mind, and yet they were constrained, at the dictation of the presiding judge, to pronounce a verdict which seemed to them to be a sort of public and open stultification of their own intelligence. Even Mr. Justice Hawkins felt the difficulty of his position, for just after he had intimated that the doctors had quite upset the theory of insanity, even if the Treasury desired to press it, he was compelled to arrest the prisoner in his wild career of words, by a hint that he himself by his line and mode of defence might be supplying the only evidence which had yet been offered as to his irresponsibility. It is high time that this sort of farce, now so frequently enacted in our Criminal Courts, should come to an end. Why should juries and public intelligence be trifled

with? Why this waste of time—this useless occupation of the machinery of the criminal law? For what will happen in this case has happened before in similar cases.

The sentence on a prisoner found guilty of such a crime as threatening to murder should be pronounced at once. But the difficulty of sentencing a man to punishment who was seen to be mad by all, from the judge downwards, is not inconsiderable. Meanwhile, the case will be reported to the Home Secretary, who will probably advise the medical re-examination of Mullens; and upon the result of that re-examination the future of the unfortunate man will be determined.

The obvious teaching of this exposure of a weak point in our criminal law is that cases of this kind should not go before a judge and jury, until they have first been submitted to a medical tribunal. There need be no fear on the part of the public of any medical one-sidedness, or that such a step as this would open the door to or constitute an apology for crime. There is scarcely a case ever before the Courts when, the question of insanity being imported, the medical testimony is not contradictory. In such cases the weight and value of it should be left for the judicial mind to determine. "Twelve honest men in a box" are a "boasted palladium of liberty," which we are never likely to part with. But why should twelve honest men be made to look ridiculous by being forced to pronounce a verdict which does violence to their own intelligence? and subsequently learn that the intelligence of a second tribunal has endorsed the suppressed collective judgment of the first?

ANTE-MORTEM EXAMINATION OF THE BRAIN.—We have received a communication from Mrs. Weldon offering her brain to a "kind of *ante-mortem* examination," in order to clear up any controversy that may exist relative to her sanity. Mrs. Weldon concludes her letter as follows: "Vivisectionists, I feel sure, will hail my proposal." She will be happy to see all those desirous of submitting her brain to this *ante-mortem* test. The idea is a novel one, but we feel certain all those desirous of availing themselves of this crucial test of her mental state have only to follow her history as it appears weekly in one of our periodicals.

LUNATIC AND IMBECILE ASYLUMS.—The annual inspection of 580 lunatics and imbeciles chargeable to the parish of Marylebone, is now proceeding at the various asylums, viz., Hanwell, Colney Hatch, Banstead, Caterham, Leavesden, and Darenth, by order of the Marylebone Board of Guardians. The examination is conducted by McGrigor Croft, Staff-Surgeon, and Mr. W. Ward, guardians of the parish. Dr. Randall, Chief Medical Officer of the Marylebone Workhouse, accompanies the guardians on their tour of inspection.

GLASGOW ROYAL ASYLUM FOR LUNATICS.—The Annual General Meeting of qualified contributors to this institution was held in the Religious Institution Rooms, Glasgow, last week. The report was read by Mr. J. R. String, C.A., the Secretary. It stated that the number of patients in the Asylum on 1st January, 1878, was 553; and there were admitted during the year, 202; the total number under care and treatment had thus been 755. Of this number, 87 had been discharged recovered, and 84 relieved; and there have died 52; so that there remained on 31st December, 1878, 294 males, and 238 females; total 532. The average daily number resident was 556; the lowest daily number resident on any one day (October 28), was 528, and the highest number on any one day (April 12), was 578. Comparing these figures with last year's, the admissions were 202, as against 219, the discharges 171, as against 150, and the deaths 52 as against 48. The net result was a decrease of 21, although the total number of patients under treatment had been larger than last year. The number at the close of the year was 532, of whom 189 were private patients, and 343 chargeable to parishes. The recoveries numbered 87, being in the gratifying proportion of 43 per cent. of the admissions. In addition to these, 51 were discharged as partially recovered, and able to reside at home under the care of their friends. The general health has been good, the death-rate low, and there had been no serious accident of any kind. An abstract of accounts read by Mr, String, showed that the total charge for the year ending 31st December last, was £33,244 18s. 10d., and there was a balance due by the treasurer of £100 2s. The discharge included £13,479 19s. 2d. for house expenses, £2,862 5s. 2d. for repairs and improvements, £2,062 for salaries, £2,815 for servant's wages, and £3,413 for new buildings.

RESTRAINT *versus* NON-RESTRAINT IN THE TREATMENT OF INSANITY.—In our next fortnightly "Department of Lunacy" we shall devote an article to the above subject.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 29, 1879.

## CREMATION.

A SMALL building which is in course of erection at Woking has renewed an interest in a subject that has lately lain dormant in the public mind. People are again beginning to ask each other's opinion about cremation, and to ask you how you would like your wife or your only daughter burnt to ashes after death. Many are in favour of it—many more have an aversion to it. In one quarter it is regarded with little less than feelings of horror and disgust; in another with an air of stoical indifference. The theologian and the sanitarian each take a view of the subject that is warped by their respective prejudices, and preconceived opinions. The pious and the soft-hearted, they who are moved by the past teachings and practices of all Christian communities, and they whose respect for the departed is heightened by the stronger sentiments of affection, are equally prejudiced against an innovation which is opposed to their religious principles on the one hand, or to their own personal feelings on the other. It is different with the utilitarian, with the sanitarian, with the sceptic. With a mind untrammelled by any of these prejudices, and looking at the matter from quite another point of view,

they are inclined to support a movement which, while it in no-wise clashes with their religious impressions, promises to be of some benefit in respect of public decency, and of public health. But they are only *inclined* to favour this proposed change in the burial of the dead, for both those who are for and those who are against the introduction of cremation into this country have expressed their opinions in such a manner as to show that their convictions on the subject are not very strong either one way or the other. The *Times* has recently come out with a long leading article, in the composition of which the writer appears to have felt a little uncertain as to which side to take. The *Lancet* has, in another leader, approached the subject with a timidity and a half-heartedness which it seldom shows on subjects on which it holds strong convictions. Neither can we wonder at this, nor be sure that our own opinions on the matter will not be characterised by that same indecision of character which has characterised the remarks of our contemporaries. The people are asked to relinquish the oldest and most natural mode of burial to which mankind has been accustomed, one that is consecrated by the prescription of ages, and one to which, from long usage, old associations, and religious and sentimental considerations, they have become strongly attached. They are asked to give up the ordinary mode of interment for one that has not been practised by any civilised or Christian nation for more than seventeen centuries, and for reasons the validity of which appear to them to be out of all proportion to the magnitude of the proposed innovation, and the sacrifice they would have to make of their own personal prejudices and predilections. They have not, moreover, been scared by any great social mischief arising from the mode of burial that has been so long and so generally adopted. No plagues, no epidemics have been traced to the proximity of the living and the dead. No isolated cases of fever, or of any kind of disease, can now be attributed to either water or air contaminated with effluvia arising from the presence of human remains. Nothing, in fact, has occurred to wean them from their prepossessions in favour of an old and time-honoured custom, and, unalarmed by any untoward incident, they are at liberty to deliberately think over the pros and cons of a practice to which they are now brought face to face.

The arguments of the cremationist are such as will readily gain the assent of all true sanitariams, while they will probably have little influence over the great mass of the people. It has been urged, and with some show of reason, that the present mode of burial is a source of danger to the living, that the air is apt to be polluted, and the water contaminated by the decaying corpses underground, and that the risk which our present custom entails, is all the greater from the rapid rate of increase in the population of all our large towns and cities. Besides, say the cremationists, sentiment on the subject is not altogether against them. There are many and many of strong religious feelings, who recoil with horror at the very thought of their departed relatives slowly decaying beneath the sod. Cremation at once puts an end to any such morbid and repulsive ideas. By fire the body is speedily destroyed and reduced to its original elements. No slow decay, no putrefactive changes are then possible, no exposure of the once beloved form to the ravages of worms, "which in lazy volumes roll." Lastly, we are reminded of the example that was long ago set us by those highly civilised and politic nations, the ancient Greeks and Romans, who were in the habit of burning their dead, and who showed it to be both a practicable and an inoffensive mode of burial, one that could be carried out in respect of every class of people. In reply to these arguments, it has been said there is no pressing necessity for encouraging an innovation which is so opposed to the long established usage, the prejudice, and the emotional feelings and inclinations of all Christian communities. There certainly was a time when the dead were interred in city churchyards, and other places so closely surrounded by dwelling houses, as to be a source of danger to the living. But all such places have been long since done away with; we seldom or never hear of any disease arising from sources that can be traced to the decaying corpses of the dead; and although there may be at present one or two cemeteries that are too near our large cities, there is no reason why the ordinary mode of interment, or some slight modification of it may not be made quite as harmless and even less offensive than cremation. It has been said that the burning of the dead, if adopted by large populations, would be by no means the very healthy and inoffensive mode of burial that has been represented. It would be difficult so to confine or destroy the noxious gases issuing from the burning bodies as to prevent them being a nuisance to those who lived in the neighbourhood where cremations took place. It is further urged that the sentimental and religious prejudices on the subject would be an insuperable obstacle to cremation being generally practised in this country; that, as it would be impossible to detect the presence of certain poisons in bodies that have been burnt, cremation would offer increased facilities to poisoners, to effect their purpose without the fear of detection; and that there are other means of disposing of the dead—such as that proposed by Mr. Seymour Haden, or the buria of the body in quick lime—which, while equally commendable from a sanitary point of view, would not be open to any of the objections that have been brought against cremation. With regard to the ancient Romans, it may be remarked that they at first interred their dead in the same manner as we do now. They adopted the custom of cremation from the Greeks, but it did not become general until towards the end of the Republic. Nor does it appear that they were influenced by sanitary considerations, for Pliny ascribes the first institution of burning among the Romans, to their having discovered that the bodies of those who fell in distant wars were dug up by the enemy. Moreover, there could not have been with them any of those religious prejudices which the sanitarian and cremationist of the present day will find so much difficulty in overcoming. The old Roman thought that after death, he was, body and soul, completely annihilated. He naturally, therefore, looked upon the burning of the bodies of his nearest relatives with very different feelings to those with which a Christian would now regard such a practice. His mode of dealing with the dead, indeed, was more typical of one who believed in the mortality, than of one who believed in the immortality of the soul.

From a sanitary point of view we are quite ready to admit that much may be said in favour of cremation, but

the principle which should guide the proceedings of the sanitarian and the social reformers should be the same as that which guide the action of the statesman and political economists in matters of great political or imperial importance, namely, not to force upon the public an innovation that is repugnant to the feelings of the multitude, unless there is some pressing reason for it, or unless, by so doing, they would be conferring upon the people such a lasting benefit as would soon silence the discontent with which the proposed reform was at first received.

All due regard must be paid to the individual feelings of the public, and it must be left for them to select in what manner their mortal remains shall be disposed of; but credit is due to the cremationists for re-introducing a form of disposal of the dead which is unmistakeably attended with the least injury to the living, for supplying a want to some who, being free from sentiment, cannot cast from them the dread of burial.

## THE DUBLIN PUBLIC HEALTH JOB.

Our readers are already familiar with the arrangement recently proposed by the Public Health Committee of the Dublin Corporation to pension off the Superintendent Medical Officer, and transfer his functions, with increased salary, to the already over-burthened Medical Officer of Health; and they will recollect that we entered a very warm protest against this transaction, on the ground that the Medical Officer of Health could not possibly discharge the duty of the additional office with efficiency, and that, therefore, the City would be practically without a superintending health officer, and would, in consequence, lapse even into a worse condition than at present. The proposal having been peremptorily negatived by the Local Government Board for Ireland, we hoped it might not have been necessary to refer to it again. It has, however, cropped up again at a meeting of the Town Council on Monday the 20th, in such a form that we are obliged to justify what we have said on the subject. We give a brief note of the proceedings:—

Mr. Gray moved that the report be referred back to the Committee for re-consideration. Some journals, to which he merely referred, had published foul attacks on the members of the committee, saying that they desired to carry a job. Those who thought he desired to job the funds were perfectly at liberty to continue to think so. Dr. Mapother had informed them that, in consequence of his increasing practice, he was willing to retire on a yearly allowance of £120 from the position he at present held, and when he (Mr. Gray) heard of it he, to use a vulgar expression, jumped at the offer. It had been said by the *Medical Press*, that published the slanderous charges against the Committee, that they wanted to get rid of their senior medical officer, and appoint a junior in his place; but the fact was that Dr. Cameron was, besides being analyst, the senior. He (Dr. Cameron) had no private practice, and was analyst, not only for Dublin, but for nearly all the counties in Ireland. He had considerable time at his disposal, for analysis required occasional superintendence more than personal work. Though necessarily much occupied, they found that he could devote abundance of time to the office of medical superintendent to perform the work in a thoroughly satisfactory manner. In 1874 Dr. Mapother was appointed at a salary of £300 per annum Consulting Sanitary Officer; and in 1877 he was made Superintendent Sanitary Officer, but without any increase of salary. He had not satisfactorily discharged the duties of Superintendent in his (Mr. Gray's) opinion, but he had those of Consulting Officer.

Mr. Byrne expressed himself in opposition to the appointment of Dr. Cameron, who could not delegate his duties as analyst to others.

Mr. Moyers, LL.D., said this was not a time to consider points of etiquette, but to act, for Dublin had attained a pre-eminence among all the cities of the United Kingdom—a pre-eminence which every member of the Council would regret—the pre-eminence in the death-rate. They should get the best man they could, without regard to the amount of salary, and one who would give them all his time. If they were a sanitary corporation they would do so, for the condition of the city was a reproach and a stain to their name. He did not think Dr. Cameron should be appointed, owing to the fact that his time was occupied by his duties as analyst, and his whole time could not be obtained for a paltry sum.

Mr. Mulligan supported Mr. Gray's motion, and said he did not think the citizens of Dublin would be unwilling to pay £1,000 or £1,200 a-year to the medical man who would be appointed.

After some further discussion—

It was moved "That the report be referred back, with a recommendation from the Council that the Committee should devise some scheme under which the services of a highly qualified medical man, who would devote his whole time to the office, should be secured for the office of Medical Superintendent."

This resolution, on a division, was carried by a majority of 18 to 6.

From this debate we have reserved the two *morceaux* which are most amusing to our readers, as they most affect ourselves.

Mr. Dawson (a blatant baker), referring to the article in the *Medical Press*, characterised it as scurrillous and disgraceful, and said it was a positive falsehood to say that the corporation took no care of the poor inhabitants of the city. There was no animal in the Zoological Gardens more loathsome, and no reptile more base, than the producer of such an article. (Hear, hear, and loud laughter.)

Mr. Shackleton said that whoever stated that they wished to perpetuate a job was a slanderer. He thought the report should be referred back to the Committee, but he was of opinion that whoever was appointed should have nothing else to do whatever.

Thus challenged upon our own assertion we are obliged to reaffirm our opinion that, in its inception, the proposal of the Public Health Committee was nothing less than a job. Whether or not designed for the purpose, it would certainly have had the effect of enabling one officer to get rid of his office while still perfectly competent to discharge its duties and to get rid of it just at the moment when, for urgent professional reasons, he most desired to retire. It would also certainly have had the effect of giving that officer £120 a-year for life, and of increasing the salary of his colleague, but to an extent ridiculously inadequate for the additional duties thrown upon him.

To relieve of his office an officer who is prevented by any circumstances from efficiently doing his work, and replace him by an energetic, active man, is, in itself, quite the right thing to do, but to do so by a shuffle of the cards, leaving his office practically vacant, is to perpetrate a job, and this job the Public Health Committee was, without doubt, anxious to perpetrate.

But, surely, our critic, the baker, need not be so virtuously indignant. Jobs are not so rare within the City Hall that they need excite even the momentary interest of a Town Councillor; and reptiles would be, indeed, more

plentiful in Dublin than St. Patrick left them, if every one who accuses the Corporation of a job was to be ticketed as an amphibian. The attitude of the Public Health Committee on the subject is difficult to comprehend. Mr. Gray, their spokesman and chairman, is of opinion they should follow the good example of some English towns, and have a medical officer to devote his entire time to the work. It was only within the last month or six weeks that the Local Government Board in England had refused to sanction the appointment of a gentleman on the ground that he could not give up his entire energies to his office, and it was in accordance with this principle he had worked since he became chairman of the Public Health Committee.

If the Council hold the opinion that they "should have a medical officer to devote his entire time to the work," on what principle do they select as their sole superintending health officer a gentleman who holds office, and intends to continue to hold it, of analyst to twenty-eight counties, lecturer on chemistry, laboratory instructor, and in half a dozen other capacities? He (Mr. Gray) did not think Dr. Mapother had carried out his duties as consulting officer satisfactorily, because he had a large and growing private practice, and a large private practice would disqualify anyone from an efficient carrying out of the duties, nor was it in human nature to expect him (Dr. Mapother) to be constantly coming into collision with his medical brethren, supervising them one week and joining in a consultation with them the next. Nor would Dr. Mapother be offended with him for saying that he had not carried out his duties in this respect, since he had never once reported on the way his brother officers had discharged their duties." Here is a confession! The Public Health Committee, while holding Mr. Gray's most just opinions, assented to the appointment of a superintendent officer, whom they knew to be devoted to private practice, and, *ergo*, disqualified. They permitted him *for several years*, to go on in the unsatisfactory discharge of his duties, never taking any step to require him to fulfil his functions as supervisor, and now they come before the citizens for permission to pension off this officer, making, however, no adequate provision for the fulfilment of the functions which he should discharge. We are in perfect agreement with Mr. Gray that a medical man engaged in private practice can never perform satisfactorily the duties of superintendent medical officer, but we are unable to understand any distinction between private medical practice and private chemical practice; and we certainly consider that a chemist, whose energies are absorbed by the making of analyses and the giving of evidence in every corner of Ireland, is even less likely to prove an efficient supervisor of sanitation in Dublin than a metropolitan hospital surgeon.

We adopt every word of the following forcible protest against delay, to which our contemporary, the *Dublin Mail*, gave expression last week: "What we protest against is the unnecessary delay. A medical officer, whose entire time and attention was given to the health of the city, would be a most valuable functionary, and if Dr. Cameron were in that position, no doubt the duty would be well performed; but it is essential that 'whole time' shall mean whole time, and not a working of half-time; and we will add that the compensation should be sufficient to warrant a first-class medical man in taking the office, and in giving up his existing or expected practice. Such an officer should be really and responsibly at the head of the sanitary staff. Nice arrangements dovetailing one office into another, and taking an income out of inconsistent duties, are not business; and the state of things is too serious in Dublin now to allow personal influences or considerations to sway a decision."

We can certainly congratulate the citizens upon the expressed determination of the town council to appoint a man devoted wholly to his duties as chief sanitarian of the city, but our satisfaction at this determination is tempered with serious apprehension that the new appointment will give occasion for a worse job than that to which we have objected. Already we hear whispers of a coming politico-religious contest, and of the probable triumph of one or other candidate, the nominee of this or that political party, or this or that clerical clique. If our entreaty would avail, we would implore Dr. Cameron to save the citizens from the inevitable competition of the relatives of corporators and *protéges* of party wire pullers, and from the catastrophe of an election of an influentially-friended nobody to this most important executive cure office in Dublin. Dr. Cameron could at once remove our alarm on this score by declaring his intention to resign all extra metropolitan employments and all offices not directly connected with the public health of the city, on condition of adequate remuneration being provided.

To secure his undivided services the citizens would willingly assent to the payment of a handsome salary, and if the offices of superintendent health officer, medical officer of health, and city analyst, were combined, the salaries now paid by the corporation for the divided duties would be amply sufficient remuneration. But if not, we insist that the saving of a little money is of no moment when such interests are at stake, and that it would be the best possible economy to secure the services of a thoroughgoing experienced and energetic sanitary supervisor, while it would be culpable extravagance to pay a salary large or small to a take-it-easy, feeble, or uneducated officer.

Is it vain to hope that for this one occasion the corporation will shut out from their minds any and every political, religious, or personal influence on behalf of or against any candidate, and will do themselves credit before the citizens by choosing for the task of sanitary reconstruction a man who knows his business well, has the pluck and energy to do his duty fearlessly, and is willing to devote himself to the performance of that task, and to nothing else?

# Notes on Current Topics.

## School Board Playgrounds.

A FEW days ago the National Health Society passed a resolution expressing a hope that the School Board for London will, at the earliest opportunity, find means for fitting up and opening the playgrounds attached to their schools, for the purpose of systematic recreation during Saturday afternoons and summer holidays.

The National Health Society is already widely known for the many excellent measures it has taken to diffuse

an elementary knowledge of sanitation among the people. Its regard to the hygienic provisions of School Boards is quite in accordance with the vigilance it usually exercises in all matters affecting the national health, and is by no means either an officious or a supererogatory proceeding on their part. Many months ago we drew attention to the reasons why the little boys and girls who come under the jurisdiction of these Boards might feel the enforced confinement of the school-room more than those who belong to a higher class of society. Accustomed, as most of them have been, to run wild about the streets, often underfed and poorly clad, and often with a naturally weak constitution of body and brain, they would be very likely to feel the want of exercise, the confinement in doors, the restraint, and the mental application incidental to a School Board education. It is well known that some of the school-rooms are not so well ventilated as they ought to be, and that they are frequently over-crowded; so that many of these children who have been in the habit of passing most of their time out of doors, would be very apt to suffer from breathing an impure atmosphere during many hours of the day. Large playgrounds, systematic exercises, and plenty of open spaces would, therefore, be a great boon to a class of school-boys, the majority of whom, it should be recollected, are not destined to follow the more sedentary and least laborious pursuits of life, but have to adopt vocations, and will be hereafter exposed to conditions, which may seriously tax their bodily energies. It is to be hoped, therefore, that the School Board authorities will give the representations of the National Health Society due consideration in order that the health and stamina of the industrial classes of the next generation shall not, through want of sufficient fresh air and out-door exercise, be sacrificed to their intellectual development.

## Infinitesimalism Gone Mad.

In introducing a course of lectures on the Homœopathic Materia Medica, Dr. Richard Hughes recently gave to the few students who attend the London School of Homœopathy an exposition of homœopathic posology. He is not himself a regular "high dilutionist," his practice stopping at the 30th centesimal potency, and only reaching this in occasional instances. Now, the third centesimal dilution contains 1 part of active principle in 1,000,000 parts of the dilution or trituration. By adding two ciphers for every dilution from the 3rd to the 30th, the student will get at a figure which represents what the latter is supposed to be. Dr. Hughes adds that many physicians of scientific reputation employ the 200th dilutions, and he declares that the evidence of the efficacy of such attentuated medicines is undeniable. He further tells us that there are homœopathists in America who have made the 1,000th potency a new unit, and have started from that to the 1,000,000th, and even to the 1-10,000,000th. The lecturer suggestively points out that to make the medium dilution of these extravagancies 2,000 *gallons of spirits of wine, a million phials, and over a year of perpetual shaking would be required.*

## Poisoning of a Surgeon by Aconite Liniment.

Mr. Harcourt McLeod Busfield, a surgeon, of Boothfold, Newchurch-in-Rosendale, Manchester, died on the 28th ult., under the following distressing circumstances:—He had been out of health for some weeks, and on the previous evening (the 27th) he retired to rest, but passed a very restless night. About half-past four both he and his wife got up. He went into the surgery, leaving his wife in the dining-room, and presently returned, and exclaimed, "I'm a dead man!" at the same time showing a bottle, the contents of which he said he had drunk. The bottle contained aconite liniment. He requested his wife to send for Dr. Wilson, a neighbouring medical man. In the meantime he drank freely of mustard and water, but he gradually grew worse, and died in about an hour, and before the arrival of a medical man. A bottle containing sherry was afterwards found next to where the bottle of aconite had been taken from, and as they much resemble each other in colour, there is reason to believe that the deceased drank the aconite in mistake for the sherry.

## Sale of Food and Drugs Act, 1875.

Messrs. Anderson, P. A. Taylor, and Whitwell, members of Parliament, have prepared and introduced "A Bill to Amend the Sale of Food and Drugs Act, 1875," which was ordered by the House of Commons to be printed on December 10, 1878. It contains only four sections and twenty-four lines. Section one is the short title. Second two provides that in the sale of adulterated articles it shall be no defence to allege that the sample was purchased for analysis, and that, therefore, the purchaser could not be prejudiced. Section three extend the meaning of the word "county," and has no bearing on the seller. Section four permits the sale of diluted brandy, whisky, and rum, when they have not been reduced below 25 per cent. under proof, and of gin not more than 30 per cent. under proof. The *Chemist and Druggist* says that if this Bill becomes law, it will deprive adulterators of a defence which has been the more popular because it has rested on a mere verbal quibble.

## The Alice Memorial Fund.

Doubtless, those well meaning gentlemen who have attached their names to the appeal for funds now being circulated throughout the United Kingdom, for an "Alice Memorial Fund at Darmstadt," have not given a moment's thought to the poverty of many of our own hospitals; we hope, therefore, we may be excused reminding them that "Charity should begin at home." To canvass the country when everything is so depressed for the purpose of transferring large sums of money from this country for the support of hospitals and training institutions in Germany, for the simple reason that Her late Royal Highness the Princess Alice took an interest in them, is one of which we cannot approve. We will not attempt to harrow the feelings of the benevolent by drawing pictures of many of our charitable institutions closing wards for want of money; we prefer saying there are such in which Her Royal Highness also took an absorbing interest, quite as much, if not more, in need of "memorial funds," without going as far as Germany for them

If our Teutonic neighbours possess that appreciation of the sterling worth of Her late Royal Highness they are accredited with, let them show it in a practical manner by supporting the charities established or promoted by the deceased princess for their benefit.

## Use of Chloroform in Diseases of the Heart.

On this subject M. Vergely, of Bordeaux (*La France Médicale*), remarks that there is a difference of opinion, some asserting that chloroform is very useful, and others that it does harm in affections of the heart. In M. Vergely's memoir, to which M. Dieulafoy has recently drawn the attention of the Societé Médicale des Hopitaux, three principal points are established. 1. That the existence of heart disease does not contra-indicate the use of anæsthetics. 2. That chloroform is a sedative in this class of diseases. 3. That it should be used with discretion. In some cases of severe palpitation chloroform may be successfully administered. Also in some cases of dyspnœa and palpitation arising from mitral insufficiency, either alone or conjointly with hypodermic injections of morphia. M. Vergely has also given it without any accident in angina pectoris, and in certain other affections of the heart characterised by dyspnœa and palpitation. From inquiries he has made into the literature of the subject, he concludes that this agent has been employed too timidly and unsystematically.

## Small-pox and the Registration of Diseases.

A case recently came before the meeting of the Asyums' Board at Deptford, which shows how much some Act of Parliament is wanted for the compulsory registration of diseases. It appears that two nurses found a man sitting by the roadside, and suffering very badly from small-pox. They were unable at the time to procure an ambulance, and actually carried him to the hospital. On arriving there, he was discovered to be in the worst stage of the disease, and soon afterwards he died. The relatives of the man stated that he had, during their temporary absence, left the house, and had been wandering about four days, when he was found by the nurses, besides which he had been ill for nine days before his escape. It is quite evident that if a Registration of Diseases Act had been in force the case of this man would have been found out in sufficient time to have had him isolated and properly looked after. It is because patients, suffering from infectious diseases, are not removed sufficiently early from crowded districts and from their still more crowded homes, that this, and other epidemic affections, spread so rapidly when once a few cases have made their appearance. At the meeting above referred to, it was stated that in the course of four weeks 218 patients were admitted to the Deptford Hospital, of whom 27 died, 142 were discharged, and 224 remained under treatment.

## Juvenile Parturition.

In a recent case (Reg. *v.* Dean) of a criminal assault on a girl under twelve years of age, tried before Mr. Day, Q.C., sitting as Commissioner, it was proved in evidence that the girl had been delivered of a full-grown child, which is still living, at the age of twelve years and one month. The prisoner, who was the girl's stepfather, was convicted of the felony and sentenced to ten years' penal servitude. It is stated that with the exception of two anonymous cases quoted in Taylor's work on Medical Jurisprudence, this is the earliest age of delivery recorded as having occurred in this country.

## University of Dublin.

The following gentlemen have been appointed by the Provost and Senior Fellows of Trinity College Extern Examiners for the Medical and Surgical Examinations in the University. Botany and Materia Medica: W. R. McNab, M.D., Professor of Botany, Royal College of Science, Ireland. Physics and Chemistry: G. F. Fitzgerald, M.A., Fellow of Trinity College. Descriptive Anatomy, Reuben J. Harvey, M.D., Lecturer on Physiology in the Carmichael College of Medicine and Surgery. Clinical Medicine: Samuel Gordon, M.D., ex-President K.Q.C.P.I. Institutes of Medicine (including Medical Pathology): James Little, M.D., Vice-President K.Q.C.P.I. Ophthalmic Surgery: Richard Rainsford, M.B., F.R.C.S.I., Surgeon to St. Mark's Ophthalmic Hospital, &c.

The rates of mortality in the principal foreign cities according to the most recent weekly official returns were in Calcutta 56, Bombay 31, Madras 38; Paris 27; Geneva 22; Brussels 26; Copenhagen 23; Stockholm 24; St. Petersburgh 44; Berlin 26, Hamburg 26, Munich 28; Vienna 30, Buda-Pesth 40; Naples 34, Venice 33; Alexandria 45; New York 23, per 1,000 of the population. Cholera caused 25, and fever 200 deaths in Calcutta. The fatal cases of small-pox in St. Petersburgh rose to 54 from 37 and 39 in the two previous weeks.

The excessive death-rate in Salford last week was due to the fatal prevalence of measles, scarlet fever, and whooping-cough. Scarlet fever also showed excessive fatality in Birmingham and Bradford. Four deaths were referred to diphtheria in Hull. Small-pox caused 12 more deaths in London, 27 in Dublin, but not one in any of the other large towns.

The rates of mortality per 1,000 last week in the twenty-three principal cities and large towns were—Brighton 20, Sunderland 20, Hull 20, Portsmouth 22, Bradford 22, Wolverhampton 22, Newcastle-upon-Tyne 23, Edinburgh 23, Leeds 24, Sheffield 25, Nottingham 26, Leicester 26, Plymouth 27, Glasgow 27, London 28, Oldham 28, Birmingham 29, Bristol 29, Salford 34, Manchester 35, Norwich 36, Liverpool 36, and the highest rate of all, Dublin 48.

The managers of the Royal Institution of Great Britain have decided that the 1879 Actonian Prize shall be awarded for an essay illustrative of the wisdom and beneficence of the Almighty, the subject being "The Structure and Functions of the Retina in all Classes of Animals viewed in Relation with the theory of Evolution." The prize is 100 guineas, and will be awarded or withheld, as the managers shall think proper.

In addition to the £10,000 bequeathed to Dudley and Wolverhampton charities already announced, the following legacies under the will of the late Mrs. Bennett, of Dudley, are to be paid within twelve months, clear of legacy duty:—Birmingham and Midland Eye Hospital, £500; General Institution for the Blind, Edgbaston, £500; General Institution for Instruction of Deaf and Dumb Children, Edgbaston, £500; Birmingham and Midland Counties Middle Class Idiot Asylum, Knowle, £500.

---

The *Liverpool Post* reports the death of Tom Thumb, at his native place, Bergen, in the province of West Friesland, in Holland, whither he had only recently retired after realising a handsome fortune from exhibiting himself in the chief countries of Europe and America. The cause of his death was dropsy. His real name was Haneman.

---

The proportion of candidates at the last examinations at the Royal College of Surgeons, England, who presented themselves and failed, was not quite so large as it has been at several previous courts. Of the 149 candidates examined, 41 failed to reach the required standard, and were referred—35 for three and 6 for six months' further anatomical and physiological study.

---

In London the deaths referred to diseases of the respiratory organs, which had been 555 and 629 in the two preceding weeks, further rose last week to 664, and exceeded the corrected weekly average by 240; 486 resulted from bronchitis and 108 from pneumonia.

---

The Medical Officer of Health for the Port of London, in consequence of the reported spread of the plague in Russia, has made arrangements for examining all arrivals in the Thames from that country, with the view to avert any possible importation of the disease by water. The Customs authorities will co-operate with the medical officer in these precautionary measures.

---

Prof. Humphry, F.R.S., of Cambridge, will deliver the biennial oration in memory of John Hunter in the theatre of the Royal College of Surgeons on the 14th proximo.

---

Hippophagy is on the increase in Paris. The number of horses sold for food last year was 11,319, being 700 more than in 1877.

---

# Scotland.

Aberdfen University.—At a meeting of the Senatus Academicus of Aberdeen University on Saturday the 18th January, Professor A. Davidson was installed in the Chair of Materia Medica.

Glasgow Death-Rate.—The mortality in the city for the week ending 18th January was at the rate of 27 per 1,000 per annum, against 28 in the preceding week, and 30, 28, and 29 in the corresponding weeks of 1876-77-78.

Glasgow Blind Asylum.—The Annual General Meeting of the qualified subscribers to this institution was held in the Religious Rooms on Monday, the 20th January, Lord Provost Collins presiding. Mr. Robert Jamieson, Secretary, read the annual report. It stated that the total number who received the benefits of the institution during the year was 151. There had been employed in the manufacturing department during the year 72 blind persons, and the wages earned by these amounted to the sum of £2,258 19s. 8d. As the larger number were unable to earn sufficient to maintain themselves and their families, the sum of £1,080 1s. 7d. was allowed to them in supplement. The sales for the past year amounted to £16,215 7s. 2d., while for 1877 they amounted to £15,012 16s. 3d., showing an increase for 1878 of £1,202 10s. 11d. The public were solicited to patronise the sales. The directors were anxious that the legacies received should be added to the capital, but hitherto they had been unable to do so, as the ordinary revenue had been insufficient to meet the expenditure. Of the sum of £1,916 10s. 3d. received as legacies during the past year, only £520 11s. 7d. had been added to the capital. With respect to new buildings, it was considered that the present was the most eligible site and a committee was appointed to supervise the erection of new buildings on the present site, at an estimated cost of about £20,000, exclusive of the cost of internal fittings.

The "Graham" Lectures.—The first of the series of "Graham" lectures, which have been instituted in connection with the Chemical Section of the Philosophical Society of Glasgow was delivered on the evening of the 22nd inst. in the lower hall of the University Museum by Mr. Wm. Chandler Roberts, F.R.S., Chemist to the Mint. The chair was occupied by Mr. James Young, of Kelly, at one time an assistant to Professor Graham. There was a large attendance. The chairman having introduced Mr. Roberts, the lecture was proceeded with. In dealing with the subject the lecturer described and illustrated the various stages of the important experimental investigations of Graham, from the time he left Glasgow, in 1837, up almost to his death. He dealt with the interesting subject of the occlusion of gases within certain solids, more particularly of the metal palladium, and in connection with which he almost completely established the metallic nature of hydrogen. Touching this point, Mr. Roberts expressed regret that Graham had not lived until about a year ago, when the metallic nature of that element was most indisputably shown by Pictet. Sir William Thomson, at the conclusion of the address, moved a vote of thanks to the lecturer, which was warmly accorded.

Edinburgh University Court.—The meeting of the University Court for filling up examinerships, &c., has been postponed to the 31st inst.

Royal Society of Edinburgh.—A meeting of the Edinburgh Royal Society was held on the 20th inst., Professor Holland in the chair. Professor Crum Brown read a paper on the "Action of Heat on the Salts of Tri-Methyl-Sulphur," and a note on the "Experimental Deterioration of the E. M. F. of the Gramme Magneto-Electric Machine at Different Speeds," was read by Professor Tait. Professor Tait also read a paper on "The Law of the Cooling of Bars."

Edinburgh Royal Infirmary.—An adjourned meeting of contributors to the Royal Infirmary was held in the Council Chambers on the 20th inst., Lord Provost Boyd in the chair. Mr. David Smith read the report of the committee, which stated *inter alia*, 1st. "That the committee had to express their deep regret at the excess of the expenditure over the ordinary income of the infirmary which had occurred last year. The deficiency had arisen from what the committee had from year to year to regret, viz., the shortcoming of the

ordinary income. The deficiency in the year ending October, 1877, was £3,582 6s., but last year it turns out to be £5,559 2s." This had arisen principally from the smaller amount of legacies received last year than in the preceding. In 1877 the legacies above £100 amounted to £15,420, while last year the amount was only £6,832. The managers out of the legacies received, specially one in favour of the Convalescent Home, have been able to defray the necessary expenditure, and at the same time to place £7,974 to the credit of what is called the extraordinary account. The source of income from the sale of tickets to students exceeded that of the previous year. The amount received last year from this source was £2,384, while the year before it was £1,985 11s. 6d. The nursing department was most successfull. With reference to the new infirmary there has already been expended the sum of £242,326, and according to the estimate of the architect, a further sum of £81,569 10s. 9d. will be required, making a total expenditure of £323,895 10s. 9d. A further sum of £25,000 it is estimated will be required for internal fittings. Altogether at least £350,000. The new infirmary is not likely to be ready for occupation this year.

Glasgow Convalescent Home.—The fourteenth general meeting of the subscribers to this institution was held at Lenzie on the 21st inst. The managers' report showed that during 1878 the total number of patients treated in the home has been 1,325, being 133 in excess of the former year. The patients treated yearly in the home have more than doubled their number since 1873. The average stay in the home had been 19 days. The whole expenditure last year amounts to £2,010 4s. 7d.. which is a cost of £1 10s. 4d. per patient. The annual subscriptions amonnt to £1,362 4s. 6d., as compared with £1,073 13s. in 1877.

## Literary Notes and Gossip.

An attempt to perpetuate the memory of St. Luke, "more surely than Bible History" can be expected to do, is to be made in March by some brilliant literary meteors, who propose embodying in a new journal corporate, *St. Luke, a Clerical, Medical, and Legal Review*. Impertinent querists will probably ask what "The Beloved Physician" had to do with law? We certainly have read of one or two medical saints, but a lawyer, never!

* * *

We learn that our *confréres* in Italy, anxious not to be behind hand with the rest of civilisation, have determined to start a new gynæcological journal, the title of which will be *Annali di Obstetrica, Ginecologia e Pediatria*. The editorship is entrusted to Sigs. Chiari, Morisani, Perro, and Tibone. The publication will be monthly, at Milan. We can only hope for our foreign embryo a larger mead of success than that hitherto obtained for the English and American obstetric and other journals of a special character.

* * *

The conductors of the *Contemporary Review* announce that Mr. Brudenell Carter, F.R.C.S., of St. George's Hospital, will reply in the February number of that magazine to a paper on "The London Medical Schools," by Mr. William Gilbert, which appeared in the *Fortnightly Review* for January. Mr. Carter's pen is quite equal to the unthankful task.

* * *

The last volume (lxxviii) of that venerable and exceedingly handy publication, "Braithwaite's Retrospect of Medicine," is now before us. Started soon after the *Medical Press*, it has appeared with the utmost regularity each six months for nearly forty years; other half-yearlies and quarterlies have ceased to exist, but Braithwaite is Braithwaite still, and long may it continue to flourish, and to give us that useful compendium, to which for so many years past we have been accustomed to turn for reference.

* * *

A "new and important work" on the "Hygiene of the Skin" is announced as in preparation, for which the publishers are touting for advertisements. The price of this "important work" is fixed at the modest price of 1s., and a first edition of 10,000 copies is "guaranteed." In order to obtain the desired advertisements its promoters state that—"This long required work will shortly be published, and will command a large sale amongst the *medical profession*, chemists, and all those who are anxious about their general health and appearance." Here is a new field for authors: write an important work price 1s., tell the public 10,000 will be published—the number will probably startle the uninitiated in editions, but no matter, ask them £5 per page for advertisements and pocket the surplus.

* * *

Among the most useful Directories (next, of course, to the "Medical"), which have been issued from the press this year is Street's "Indian and Colonial Directory" now laying before us, and to those who have relatives in those parts, or think of going thereto, it will be especially valuable. The various steam routes to the places treated of, with rates of fares and times of transit are given, thus placing concisely before the public the different facilities offered by the several companies. Particulars of the various railways in operation or construction are also supplied where practicable. The London agents to each of the banks are named, so that a traveller is enabled to see to whom to apply, where financial information or assistance is needed in connection with any particular town or city. Full particulars of the principal products are given, and articles which form the chief trade of each place. Maps of the various countries are also given, the object being rather to show the relative positions of the principal towns than to fill the maps with innumerable names of unknown villages or stations. Much time and labour have evidently been bestowed on the production of the work, which deserves every success.

* * *

Reprints of "original communications" that have appeared in our columns have been somewhat numerous during the past few weeks. Dr. Stretch Dowse has just issued the series of lectures on "Syphilis of the Brain and Spinal Cord" (Baillière, Tindall, & Cox), expanded to a handsome book, with several coloured plates. Dr. Godwin Timms has reprinted in pamphlet form his papers "On Alcohol" (Baillière, Tindall, & Cox). Dr. Routh his paper "On the Population Question," read before the British Medical Association, with the discussion thereon (Baillière, Tindall, & Cox). Dr. Day, of Stafford, his address before the Sanitary Institute, "On Ozone in Relation to Health and Disease" (J. & A. Churchill), and Mr. Marlett Boddy, F.R.C.S., has expanded his papers "On Hydropathy" to a demy 8vo pamphlet of fifty-four pages. Thus there have been five reprints in book or pamphlet form from our columns in about a fortnight.

* * *

Books on domestic medicine for the lay public have had several additions of late. But a few months since Dr. Naphey's "Body and its Ailments" was issued (price 6s.), which has attained such popularity, that we are told a very large edition is well nigh exhausted. Another and a much more pretentious volume of over 1,000 pages (price one guinea) is now before us from Messrs. Cassell, Petter, & Galpin, entitled "The Family Physician," "by Physicians and Surgeons of the London Hospitals," who the authors are does not appear. Still a third, in the shape of a second edition of Dr. W. J. Russell's "Domestic Medicine and Hygiene," a small 32mo book of 400 pages at the modest price of two shillings. Certainly, the colonists—most of these works are compiled for the especial benefit of antipodeans and others far removed from the tender mercies of medical men—ought to feel grateful to authors and publishers for their solicitous attention to their necessities.

* * *

The *Indian Gazette* announces that the Government of India offer a reward of 500 rupees for the best Sanitary Primer suitable for use in Indian Schools, both English and vernacular. The work must be in the English language, from which it will afterwards be translated into the principal languages of India. It is required to be simple, "without theories," thoroughly practical, and showing in particular the chief sanitary defects of Indian towns and villages, and the best means of remedying these effects; all this within MS. that will not cover more than from twenty-four to thirty pages of print, of small-pica octavo size. We happen to know one celebrated writer quite equal to these requirements, but we fear he would have some difficulty in getting over the proviso that "the handwriting must be legible!"

It is said of Massino d'Azeglio, that he wrote his own opera, composed the music, painted the scenery, directed the orchestra during the overture, and afterwards appeared on the stage in the principal tenor character of the piece, thus occupying the *rôle* of poet, musician, painter, conductor, singer, and actor in one evening. We do not know anyone in our profession who embodies in his own august person quite so many attributes, though brass plates and illuminated door lamps occasionally supply the public with information that their possessors are physicians, surgeons, and accoucheurs, that they draw teeth and act as chemists by supplying medicines at so much per head. We have, however, known Germans who combined under one cerebral atmosphere, physician, surgeon, author, critic, and bookseller; but this is decidedly more reputable than paying for another's brains, and issuing the book as the effort of your own; still better than stealing another's brains without acknowledgement.

***

The rapidity with which our postal communications are transmitted in foreign parts was exemplified rather strangely a few days ago. A bet was made between some literary men at one of the London newspaper offices, in September last, as to the time letters and post cards would take to travel round the world. Accordingly, six post-cards and six letters were posted on October 1st, the front sides in both cases being ruled off into six equal compartments to receive the various addresses, room being left at the top for a row of postage stamps. On the backs were carefully-worded printed instructions as to the course to be pursued by the recipients, and columns for filling in date of receipt when re-mailed, and for the number of post-cards and letters received. A list of correspondents' addresses was also given, commencing at Alexandria, and going on to Singapore, Yokohama, San Francisco, New York, and back again to London, with a request that each correspondent would cancel the last address, and put the next in the compartment following, and affix the necessary stamps to cover postage. Out of the dozen sent, five letters and one post-card came back to London, after their long journey, by the early (8 o'clock) post on December 31st, thus taking 90 days 20 hours, perhaps the very quickest that could be made under any circumstances. The letters and single post-card arrived in perfect condition, but presented a most strange appearance, being almost covered with cancelling marks and postage stamps of various descriptions, besides the numerous addresses and scorings out in various coloured inks.

# Correspondence.

## DISQUALIFICATION OF VOTERS BY MEDICAL RELIEF.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—With reference to some notes in your paper of the 25th of December on the Medical Relief Voting Disqualification Bill, I may mention that alterations have already been made, which I think meet the objections that you make to it. It is no longer applicable to out-patients, or to any medical relief, except that given in consequence of a person becoming an inmate of a hospital for infectious diseases.

Yours faithfully,

Green Bank, Liverpool, Jan. 1, 1879. W. Rathbone, M.P.

## LIFE INSURANCE QUERIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—How ought the following query in a life insurance paper be filled up?

"Describe the general configuration, condition, and physical development of applicant."

A reply in your next issue, will greatly oblige

Life Insurance.

[The question is ridiculously vague. Perhaps "Fat, fair, and forty," would be an adequate reply in feminine cases, or "Small, spare, and sinewy" for men. Many of the queries which medical referees are obliged to answer are, however, much more foolish—for instance, such as these: "Have either of applicant's grandparents met with any accident during childhood? Have any members of applicant's family been addicted to intemperence?" Queries such as these should never be answered by the medical referee, except by such a reply as "Cannot say." It is obvious that the medical referee should not make himself responsible for anything but what he can see for himself. Those statements which are simply supported by the assertion of the applicant should be included amongst the replies which he (the applicant) gives to queries. If the medical examiner asks a question the reply cannot bind the applicant in the least degree, unless the examiner is prepared to swear to that reply; and even then the examiner is responsible for the form in which the reply is expressed—a responsibility which does not fairly rest upon him. The examiner should be obliged to ask those questions only which bear directly on the applicant's state of health, and he should be prepared to verify the reply by reading over his entry to the applicant.—Ed. M. P. & C.]

## VACCINATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In your issue of the 8th inst., appears a letter from Mr. Donovan, which requires, I think, some notice from me. Had the writer read my paper attentively, he would have seen that I gave as a cause for the "unwillingness" to bring in children for vaccination, the barbarous way vaccination is performed in some cases. Mr. Donovan accuses me of casting a slur on the public vaccinators. Again I must accuse him of inaccuracy. I distinctly stated that it was to save my brother dispensary doctors *annoyance* that I advised public vaccine collectors. I was far indeed from wishing to cast a slur on public vaccinators. Mr. Donovan perhaps has heard of the proverb—"It is an ill bird that befouls its own nest." I wonder what he calls accusing public vaccinators of not using the same precautions and tenderness in dealing with the children of the poor as they would with their own children? Surely, not a slur, perhaps an "unwillingness" (please Mr. Editor, do not forget the inverted commas) to do their duty to the poor man as well as to the rich. Mr. Donovan, I am afraid, has still to learn, that the Irish dispensary doctor is a man of honour and a christian, and that both professions inculcate that, when a medical officer is put in sole medical care of poor persons, and especially of *poor children*, he is bound by every law to make no difference between rich and poor.

Yours, obediently,

Thos. P. Tuckey, M.B.

## HOW TO LIVE ON SIXPENCE A DAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—As considerable inquiry has lately arisen on this subject, and as the food question forces itself into prominence, you will, I trust, permit me to mention that the Vegetarian Society offers to supply freely information concerning the dietetic practices of its members, and that I shall have pleasure in forwarding papers on the subject to any reader who may favour me with his address, by post-card or otherwise.

Yours faithfully,

Cheadle, Cheshire. R. Bailey Walker, F.S.S.

## "THE VACCINATION SYSTEM."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The letter of Dr. Donovan in your issue of 8th inst. on the above subject, calls for some reply, as the innuendo contained therein is likely to lead to an erroneous conclusion amongst people who might take his opinion as an authority on vaccination and public vaccinators. He says, the "unwillingness" on the part of the guardians of children to have lymph taken, is owing to the "manner" in which the operation is performed; the context explains that he means to say the manner is generally rough and slovenly. Now I do not pretend to have as extensive a field for performing the operation as Dr. Donovan, nor do I compare my skill to to his—comparisons are odious—but I say there is a very great unwillingness in many instances in my district to allow lymph to be taken; and I fearlessly assert that it does not arise either from roughness or want of due care in operating.

In more than one instance, I have seen mothers evince very great unwillingness to have the lymph collected off the arm after they themselves, by their own carelessness, had ruptured the vesicle, and allowed the lymph to escape.

As well as being a little too dogmatic, for a mere *opinion* of *one* public vaccinator, Dr. Donovan's letter is somewhat inconsistent, for while he insinuates that there is very generally "incompetence" amongst the public vaccinators of Ireland, and blames the Local Government Board for not requiring a guarantee as to competence, he admits that the appointment of a public vaccine collector would be a "direct slur on the proficiency of the Irish public vaccinators." Surely it would not be any slur if a man his equal, if such could be found, in operative tact and *gentleness with children*, were appointed to the office. Such a man is, by his own showing, a *rara avis*, at least in the capacity of public vaccinator, and could not fail to be respected, I had almost said revered, by all of us for his *gentle* qualities.

Yours, &c.,

A PUBLIC VACCINATOR.

January 10th, 1879.

## FIFTEEN CIGARS A DAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the MEDICAL PRESS AND CIRCULAR of the week before last, I notice that a case had been cited in Paris at the Congress on Hygiene, of a gentleman who for some fifty years had smoked as many as fifteen cigars a day, and yet had maintained health and strength. The case, so far as it goes, is full of interest. It shows one point in hygiene most strongly; and that is, the extreme value of inheriting a vigorous constitution from our parents. This, after all, is the very most important essential of a healthy and happy existence. But, if some persons should allege, because of instances of men and women of such powerful organisations being enabled to pass a flourishing life whilst they indulge largely in alcoholic fluids and in tobacco, that this plainly shows that the use of alcohol and tobacco is not very frequently productive of disease, I am sure every clinical observer would hasten to negative such a conclusion.

My own experience of the evil effects of great tobacco smoking and chewing, is that these are among the most prevalent causes of chronic disease in the male sex. Of course, I do not mean for one moment to compare the dangers caused by the use of tobacco with those we are so familiar with at the bedside, in cases of diseases caused by alcohol. Tobacco does not cause cirrhosis of the liver, nor disease of the lungs and heart, in the same way, or with the same frequency as chronic tippling does. But there are, nevertheless, several well-marked diseases caused by the taking in of nicotine into the blood, whether through the absorbents of the mouth in smoking, or, more rapidly, in the case of chewing. First of all, the digestive organs are often greatly impaired by the use of nicotianæ tabacum. The teeth are frequently blackened, and the gums swollen in great smokers and chewers. Caries of the teeth is favoured by the various acids produced by the burning of tobacco, and mingled with the saliva. Duskiness of the fauces, and relaxed sore-throat, are far too prevalent among smokers, as good observers have long noticed. Dyspepsia caused by nicotine is so common as to be hardly worth referring to. Diarrhœa, or, more frequently, constipation, is induced by the use of tobacco in many instances. And I must not omit, in passing, the remark that the *male sex*, who smoke, are alone, with the very rarest exceptions, the subject of epethelioma of the lip. I once saw such a case in an old Irish woman, who was a constant pipe smoker.

With regard to the nervous system, the weakness of vision produced by nicotine is a constant trouble to youthful smokers. Mr. George Critchett has remarked that, among wealthy young men, weak sight is very frequently indeed caused by their extravagant addiction to cigars and pipes. Tobacco amaurosis, too, is far from rare. In very young men, the use of nicotine is peculiarly inimical to intellectual improvement. Thus, M. Joly found that, in the Polytechnic School at Paris, the non-smoking students carried off the very great majority of the prizes for mathematics; and Dr. Kostral, physician to the State factory of tobacco of Austria, shows how nicotine poisoning often kills the young boys of the factory, and causes abortions in the young mothers, and death of infants at the breast, through the nicotine contained in their mother's milk. For my part, I say, that the use of tobacco is quite opposed to all medical experience; and I could cite a host of witnesses of the greatest eminence to that effect.

I am, Sir,

Your obedient servant,

CHARLES R. DRYSDALE, M.D.

17 Woburn Place, W.C.,
Jan. 11, 1879.

# Medical News.

**Royal College of Surgeons of England.**—The following gentlemen, having passed the required examination for the diploma, were duly admitted Members of the College at a meeting of the Court of Examiners on the 20th inst. :—

| | |
|---|---|
| Benington, R. C. | Jones, F. F., L.S.A. |
| Bridgeford, W. A. S. | Leftwich, C. H. |
| Childs, C., L.R.C.P. | Lucas, C., L.S.A. |
| Davies, D. S., L.S.A. | May, T. H., M.D. Dub. |
| Deakin, J., L.S.A. | Rigden, B. |
| Hicks, F. J., L.S.A. | Russell, G. H. |
| Hughes, T. M., L.S.A. | Shaw, W., M.B. |

The following gentlemen passed on the 21st inst. :—

| | |

| Hartley, J. | |

**Society for Relief of Widows and Orphans of Medical Men.**—A Quarterly Court was held on January 8th, Edward Tegart, Esq., V.P., in the chair. A sum of £1,267 was voted for distribution among 58 widows, and 11 orphans; and 3 orphans in the Copeland Fund. The expenses of the quarter were £50 18s. 3d. The Secretary stated that he had received applications from 2 widows and 1 orphan, but as the proper forms had not as yet been returned, the cases could not then be considered. One member was elected, and the deaths of 4 members reported.

**Pure Spirit.**—We are asked to announce that the Gold Medal for pure spirit at the Paris International Exhibition, being the highest award, has been obtained by Messrs. Kinahan, for their LL Whiskey.

**Small-Pox and Fever in London.**—A meeting of the managers of the Metropolitan Asylums District took place on Saturday last, under the presidency of Dr. Brewer. There was an unusually large attendance of members. The fortnightly report was presented in reference to the state of the small-pox and fever hospitals in the metropolis, and the prevalence of these diseases in the metropolis. At Hampstead, the number under treatment was 19, with 280 vacant beds; at Fulham Hospital, 47; number of beds available, 194; at Deptford Hospital, 247 patients, and 83 beds available. The total for the fortnight ending 24th January was 313 patients, leaving 567 beds available. The total patients for the preceding fortnight were 260, showing an increase of small-pox patients of 53. The reports as to the fever hospitals showed a decrease of 10, as compared with the previous fortnight. Considerable discussion ensued as to the discrepancy in the expenditure of staff in the hospital, it being stated that Hampstead Small-Pox Hospital, with but 19 patients, had an equal staff, or nearly so, to that of Deptford

Hospital, which had 247 patients, the amount of salaries showing only a difference of £7. The report was ultimately received.

**National Dental Hospital, London, W.**—The Annual Meeting of the Subscribers was held on Friday last, at the hospital, the president of the institution, the Right Hon. Lord Viscount Enfield, in the chair. The reports showed that the progress of the hospital had been extremely satisfactory during 1878; the receipts, notwithstanding the general depression, showing an increase over those of 1877, and being the largest received during any year since the hospital's foundation. The number of patients attending the hospital had increased over the previous year by 1,097, the total number being 10,014; the operations performed had been 13,067.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

In consequence of great pressure on our columns we are compelled to crowd out several important contributions, amongst others an Obituary of Surgeon-Major Gayer, several Original Communications, Reviews, Correspondence, &c.

### A CASE FOR SYMPATHY.

THE melancholy and sudden death of the late C. J. Axford, M.R.C.S., of St. Leonard's-on-Sea (which resulted from the excessive use of chloroform, inhaled to relieve the severities of asthma), has left Mrs. Axford a widow with three children, for whom there is not the smallest provision.

The members of the medical profession and others are earnestly solicited to contribute to a fund now being raised on their behalf, and having satisfied ourselves of the *bonâ fides* of the case, we have no hesitation in placing our columns at the disposal of those gentlemen who have undertaken to receive subscriptions.

References { Dr. Ady, F.R.C.P., 1 West Ascent, St Leonards.
Dr. Bagshawe, 6 Warrior Square, St. Leonards.

Donations will be thankfully received by—
Messrs. Coutts & Co., Bankers, Strand, London.
W. Haward, M.R.C.S., &c., 33 Marina.
F. B. Courtenay, M.R.C.S., 2 Chandos St., Cavendish Sq., London.
G. W. Hind, F.R.C.S., 22 Gower Street, Bedford Square, London.
At the Office of the *Lancet*, Bedford Street, Strand.
And at the London Office of the MEDICAL PRESS AND CIRCULAR.

THE PSYCHOLOGY OF HAMLET.—In our next will appear an article on "The Psychology of Hamlet" by Dr. L. S. Forbes Winslow.

F.R.C.S.—With pleasure.

ANNEX.—We have received the Report of the Jurors in the Materia Medica Section, to which we intend referring later on.

ÆSTHETIC.—Quite an unusual occurrence; try the experiment again.

A MEMBER.—If possible in our next.

SMOKE.—A pamphlet, entitled "May Young England Smoke?" has just reached us in the form of a second edition, evidence at least that some previous copies have been read, we hope to the satisfaction of the author. May Young England smoke! Certainly, if so disposed, just as Young England may eat, drink, and be merry, so long as it keeps its appetite and indulgence in these necessaries or luxuries, as the case may be, within reasonable limits, and takes care not to insist upon it in the presence of those who object. It may be as well to mention that we have not yet gone beyond the title page of "May Young England Smoke?"

THE DUBLIN OBSTETRICAL SOCIETY will meet on Saturday, Feb. 1, at 8 o'clock, at the College of Physicians, when the following communications are set down for reading: Dr. W. J. Hark. "On Ovariotomy."—Dr. Macan, "On Contracted Pelvis."—Dr. Purefoy, "On the Prevention of Puerperal Inflammation."

DR. HARDY'S paper "On Diphtheritic Paralysis" received.

MR. E. MARLETT BODDY, F.R.C.S.—Paper "On the Advantages of Calomel, especially in Typhoid Fever," received.

PROF. CHARCOT'S "Lectures on the Pathological Anatomy of Diseases of the Lungs," concluding lectures, received.

AN AMERICAN SKETCH OF AN ENGLISH PHYSICIAN.—We copy the following extract from the *Cincinnati Lancet and Clinic*, of Dec. 7, 1878: "Probably, the English medical author best known in the United States at present, always next to Sir Thomas Watson, is Dr. J. Milner Fothergill. He has an easy, transparent, and interesting style, and he uses the most recent and recondite medical knowledge to illustrate his points in such a way that his readers cannot fail to appreciate them. Fothergill is very accessible, has a great deal of genuine *bonhomie*, with no end of north country shrewdness; and, I believe, has a regard for American physicians, based on a fortunate experience in meeting first-class men pursuing their studies, like himself, in Vienna. Fothergill is known amongst his London familiars as "the Claimant." In size and appearance he is said to resemble the famous Tichborne pretender—hence the name. He weighs about 300 pounds, and he puffs and blows as he rolls along the Queen's highway like a steam-engine. His face is red, his voice loud, and his laugh is like the explosion of a volcano. He wears in London a broad-brimmed hat, like a Mexican sombrero, and a thin coat like an American sack. He suffers from the heat! When he takes his bandanna from his pocket and wipes the sweat from his forehead, and then clears his throat preparatory to a speech, the world attends. A London paper of a personal kind the other day told a story, the hero's name was concealed, but it could be none other than Fothergill. "A physician, returning late the other night from visiting a patient, was assailed by a foot-pad." "What did you do?" said his friend, to whom he told the story, "Fell on him, and mashed him. He was never seen afterwards." If Fothergill were anything else than the man of genius, the true friend, and the kind hearted physician, these peculiarities would tell against him; but no one possessed of the least discrimination could fail to see, under this rather rough exterior, the highest qualities of a superior manhood. Long may he live to write books and to have thousands of readers in the United States; and may the publishers, who profit by his genius, be moved to compensate him for his labour."

THE APOTHECARIES' SOCIETY *versus* SHEPPERLEY.—We regret to hear, as we are going to press, that the appeal in this case, which was given in favour of prescribing chemists, has been withdrawn. Certainly, after the letter of the Solicitors of the Medical Alliance Association, in our columns a fortnight since, the position of the Apothecaries' Society was defined, and should have decided their course of action.

### VACANCIES.

Armagh Union, Richhill Dispensary.—Medical Officer. Salary, £120, with fees, and £20 as Sanitary Officer. Election, Feb. 10.
Crediton Union.—Medical Officer for the Cheriton District. Salary, £40, with the usual fees extra. Applications to the Clerk of the Guardians before Jan. 31.
Inverness District Asylum.—Assistant Medical Officer. Salary, £80, with board. Applications to Dr. Aitken before Feb. 8.
Leeds Union.—Assistant Medical Officer. Salary, £100, with board. Applications to the Clerk of the Board, Union Offices, Leeds, before Feb. 2.
Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70 with board. Applications to the Chairman before Jan. 31.
Richmond (Surrey) Infirmary.—House Surgeon Salary commencing at £80, with board. Applications to the Secretary before the 15th prox.
Roscommon County Infirmary.—Apothecary and Registrar. Salary £60, with apartments and allowances. Election, Feb. 17.
St. Pancras, Middlesex.—District Medical Officer. Salary, £110, with the usual extra fees. Applications to the Clerk at the Union Offices before Feb. 10.
Tuam Union, Abby Dispensary.—Medical Officer. Salary, £120, with fees, &c. Election, Feb. 3. (See Advt.)
West Ham Union, Essex.—Medical Officer. Salary, £100, with the usual extra fees. Applications to the Clerk, Workhouse, Leytonstone, E.

### APPOINTMENTS.

COATES, A., L.R.C.P.L., M.R.C.S.E., a Medical Officer to the Salisbury Proflident Dispensary.
DIXON, J., M.R.C.S.E., Honorary Consulting Surgeon to the Brighton and Hove Dispensary.
EDGAR, J. W., M.D., C.M., Medical Officer for the Settle District and the Workhouse of the Settle Union.
HARRIS, V. D., M.D., M.R.C.P.L., an additional Assistant Physician to the City of London Hospital for Diseases of the Chest.
MORRIS, J., M.R.C.S.E., an Honorary Surgeon-in-Ordinary to the Brighton and Hove Dispensary.
O'NEIL, P. L., L.R.C.S.I., L.K.Q.C.P.I., &c., Medical Officer to the Athy Auxiliary Small-pox Hospital.
ORMEROD, J. A., M.B., M.R.C.P.L., an additional Assistant Physician to the City of London Hospital for Diseases of the Chest.
ROBERTSON, J. G., M.B., C.M., Resident Medical Officer to the Gateshead Dispensary.
ROSS, F. O., M.B., L.R.C.S.I., House Physician to the Hospital for Women, Soho Square, London.
ROWE, G. H., M.R.C.S.E., House Surgeon to the Worcester General Infirmary.
WAYLEN, G. S. A., L.R.C.P.L., M.R.C.S.E., Medical Officer of Health for the Devizes Rural Sanitary Distrsct.

## Deaths.

ATKINSON.—Jan. 17, at 20 Lower Gardiner Street, Dublin, Maria, wife of Robert Atkinson, M.R.C.S.E.
ATKINSON.—Jan. 23, at 20 Lower Gardiner Street, Dublin, Robert Atkinson, M.R.C.S.E.
BURTON.—Jan. 18, at Washington Street, Brighton, Boston, Massachusetts, America, Henry Wingfield Burton, L.R.C.S.I.
BYASS.—Jan. 9, at Rayleigh, Essex, James Byass, L.S.A.L., aged 81.
COATES.—Jan. 13, at Micklegate, York, William Coates, M.R.C.S.E., aged 71.
HENDERSON.—Jan. 13, Joseph Henderson, L.F.P.S.G. (of Deptford), aged 52.
MCDONALD.—Jan. 4, at Dundee, James McDonald, L.F.P.S.G., aged 3[illegible].
ROBINS.—Jan. 14, at Betley Heath, William Robins, L.S.A.L. (formerly of Oxford Terrace, Paddington), aged 65.
WILDBORE.—Jan. 15, at Walthamstow, Daniel Peacock Wildbore, F.R.C.S.E., aged 86.
WEBSTER.—Jan. 8, at Warriston Crescent, Edinburgh, Dr. Alexander Binny Webster, formerly of the Bengal Service.
WHITE.—Jan. 13, at Richhill, co. Armagh, John White, L.R.C.S.I., aged 38.

## Clinical Lecture

ON

## CATARRHAL OPHTHALMIA.

By Mr. HAYNES WALTON, F.R.C.S.,

Surgeon to St. Mary's Hospital, and Surgeon in Charge of the Ophthalmic Department of the same.

Gentlemen,—The term ophthalmia is frequently used to express inflammation of any part or appendage of the eye. In teaching, and in science, we must be as accurate as we can, though often rather arbitrary in our terms. We restrict that of ophthalmia to inflammation, and its consequences of the conjunctiva. To inflammatory affections of the eyeball we apply the term ophthalmitis; iritis, it used to be called, when as yet it was not known that the iris does not inflame without the rest of the eyeball being similarly affected.

I proceed to consider the disease of catarrhal ophthalmia. Catarrh merely means "to flow down, (καταρριεδ)" and a catarrhal affection is an acute or sub-acute inflammation, or engorgement of any mucous membrane, by which is produced swelling and abnormal secretion, either mucus or muco-purulent discharge, and free production of new cells. I allude briefly to definition, because I so often hear of catarrhal ophthalmia and purulent ophthalmia, spoken of as if they were different affections. No generic distinction is admissable, but classification is needed, such as simple catarrhal or epithelial ophthalmia—the mucous variety; and severe catarrhal—the purulent variety. But the line of demarcation cannot always be drawn. It is not always possible to say whether the mucus or the pus element prevails. Then the two varieties which I have named may, either of them, be mild or intense.

The patient on whom we concentrate our attention to-day—I have drawn attention to him several times—is aged 27, and a butler by occupation. He was admitted Dec. 23 with simple catarrhal or epithelial ophthalmia. I will describe the usual symptoms of a typical instance of the affection.

*Symptoms in their order of Development.*—A sensation of sand, or dust, or grit in the eye. The deception is produced by the sensitive palpebral conjunctiva rubbing against the enlarged and projecting blood-vessels of the sclerotic portion of the same; adhesion of the edges of the eyelids in the night; redness of the palpebral and reticular redness of the rest of the conjunctiva. The undue colour is not vivid, but like brick-dust, or bluish, or it has a tint of lilac or violet. This is because the conjunctival vessels only are involved. The vascular network, which consists chiefly of veins, moves with the conjunctiva when it is raised or drawn from the eyeball. There are meshes of it, varying in size from a pin's head to the breadth of the cornea. Hæmorrhage may occur from the passage of the red corpuscles of the blood through the capillaries, or from rupture of them.

While the degree of the hyperæmia of the ocular and the ocular-palpebral portion of the conjunctiva is unmistakable, that of the palpebral portion is not so apparent. It must be judged of indirectly or inversely by the extent to which the Meibomian glands are obscured.

While thus speaking of this conjunctival inflammation in individual description, it must not be supposed that there is a definite line to the diseased action. Anastomosis of the blood-vessels renders this impossible. The vessels of the sub-conjunctival tissue particularly, and those of the sclerotica, are in some degree affected. When they are more than usually influenced they may be readily discerned as being deeper, darker, and lying in different directions to those of the conjunctiva. You should learn to recognise them.

The conjunctiva swells. The palpebral portion is villous and irregular. This is due to the villi being engorged and turgid, and the glands being enlarged and prominent from their increased activity. The oculo-palpebral and ocular portions of the same are thickened. This state must not

be mistaken for the chronic condition of granular conjunctivitis.

Chemosis is very rare; it appears only when the inflammation is highest, is seldom very marked, and is always of the serous form. The conjunctiva never adheres to the cornea.

The ordinary lachrymal moisture is increased in the first instance, then it stops, and its place is supplied by mucus from the inflamed membrane, and which has some corpuscular elements. The recent pus cells are partly emigrant white corpuscles, and partly productions from within the epithelial cells by endogenous multiplication. The mucous glands give a freer secretion; the discharge gets thicker, and is whitish or yellowish. Later it may take on more of a purulent character from the greater number of the corpuscular elements. Most of these cannot be told from pus corpuscles. But the quantity and quality of the abnormal product depends on the extent of the inflammation. This, the mucous variety, may not pass its bounds, or it may go into the purulent variety. There may be a little mucus lying on the eyeball, just enough to be recognised, or it may collect in quantity about the cilia, and glue them together in bundles, or it may be so purulent or profuse as scarcely to be distinguised from mild purulent ophthalmia.

Intolerance to light is scarcely present, nor is there increased lachrymation unless the cornea be in some way diseased or injured, or the sclerotica be inflamed. Such complications are extremely rare, unless the ophthalmia be from a mechanical cause.

Pain does not occur, or but very exceptionally. There is no impairment of vision beyond what is caused by the secretions passing over the cornea, and forming a semi-opaque medium or cloud which obscures the sight; or some peculiarity of refraction, such as prismatic colours, or distortion of objects, which are due to alterations in the corneal epithelium.

The active pupil and the acuteness of vision declare the eyeball to be sound. So long as the visual power is unimpaired we are sure that the redness is surface action, and chiefly conjunctival.

There are scarcely any constitutional symptoms, unless the mucous membrane of the nose and that of the frontal sinuses participate, when there is generally catarrhal fever, with headache, heat, chills, a foul tongue, impaired appetite, and perhaps sickness.

Both eyes are usually attacked, not always at the same time, and if separately, the second is involved just as the other is getting well.

Whatever may be the degree of the symptoms, they are usually more marked in the evening, but decline when the patient retires to rest. Sleep is not interfered with. The affection is usually symmetrical, and both eyes are attacked at the same time. There may be exceptionally slight febrile symptoms.

To continue the case before us, let me remind you that there are frequently variations in the symptoms of disease, and even characteristic ones may be very slight or actually absent. Here only one eye was attacked, and there was much pain from the commencement, little morbid secretion, more mucus than pus, much swelling of the upper eyelid, and a great deal of serous chemosis. This collection of serum gravitated according to the position in which the head was placed, and bulged the conjunctiva very much. And on this last-mentioned peculiarity in the case alone shall I dwell. It differs in appearance and in effect from the fibrinous chemosis of severe catarrhal or purulent ophthalmia, which overlaps the cornea circularly, adheres to it, and is the cause of the circular and distinctive ulceration of the corneal margin. The more there is of this firm chemosis, the greater is the danger to the eye.

*Treatment.*—If the exciting cause be removed, the inflammation will nearly always decline under the influence of local cleanliness, and still quicker with the advantage of lessening suffering under very simple treatment. This consists in frequent fomentations, the use of astringents—here alum was prescribed—rest to the eye, confinement to the house in cold weather, and if there be a marked mixture of pus with the mucus, when there are usually febrile symptoms, then confinement to the house regardless of the weather; attention to any disordered constitutional states, be they those of depression or otherwise. The condition of the general health may render a person liable to repeated attacks. Whichever astringent is used it should be so diluted that it shall not produce pain, nor even decided smarting, or harm instead of good will ensue. Of all drugs nitrate of silver is that which is most abused.

I incised the conjunctiva at once with the circular knife made for the purpose, making four incisions, two above and two below. Immediately the patient began to improve, and now at the end of a week every symptom is better, and the chemosis is gone. As there was general feebleness, iron has been given all along.

Some one asked me just now how this case differed from conjunctivitis. It is a conjunctivitis, and according to my teaching, it is that and something more. I usually restrict the term conjunctivitis to that state of the conjunctiva in which there is much redness, and even swelling, without discharge. There may even be dryness of it. For the most part it is a chronic state, some would call it hyperæmia rather than an *itis*.

The man left the hospital on the 12th day.

## ON THE PATHOLOGY OF PERIPHERAL NERVE-DISEASES. (*a*)

By JULIUS ALTHAUS, M.D., M.R.C.P. Lond.,
Senior Physician to the Hospital for Diseases of the Nervous System.

In introducing his subject, Dr. Althaus alluded to the discrepancies existing amongst the authorities concerning the frequency of inflammation of the peripheral nerves, giving it as his opinion that this was more common than was generally supposed, and that, although the evidence of post-mortem examinations was as yet not large, the clinical symptoms were in some instances sufficiently striking to warrant the diagnosis of neuritis or peri-neuritis. Inflammation attacked the entire structure of the nerve, or only its investing membrane—the peri-neurium—the fundamental difference between the two diseases being that in neuritis the central core, or cylinder axis underwent the same degeneration as all the other portions of the nerve, while in peri-neuritis this important part escaped destruction. He then described the different forms of neuritis pathologically, viz., the interstitial proliferating, the hyperplastic parenchymatous, the ascending and descending, and neuritis nodosa. Regeneration was more easily effected in nerves which had only the function of common sensation and motion, and less easily in those which belonged to the special senses; and peri-neuritis was, other things being equal, much less grave than neuritis, on account of the inflammation being confined to the sheath of the nerve, and sparing the cylinder axis.

After describing the various causes leading to neuritis, Dr. Althaus related a case of acute inflammation of the olfactory nerve, which had occurred in a patient under his care at the hospital, suffering from progressive locomotor ataxy. The principal symptom had been subjective olfactory sensation of phosphorus for about a month, upon which anosmia, or complete loss of smell, had become developed. He analysed the case with regard to the seat of the affection, showing that it was not due to any affection of the accessory mechanism of smell in the nose, nor of Ferrier's olfactory centre in the tuberculum cornu ammonis, but to inflammation of the bulbs on the cribriform plate of the ethmoid bone. This diagnosis had

(*a*) Paper read before the Medical Society of London, January 13th, 1879.

since then been confirmed by post-mortem inspection. The subjective olfactory sensation of phosphorus was explained by assuming that the olfactory nerve responded to stimulation other than by special odoriferous substances, by perception of the smell of phosphorus. Thus the constant voltaic current applied to the mucous membrane of the nose caused the one subjected to the experiment to perceive a phosphorous smell.

The author then described a case of auditory neuritis, going, at the same time, fully into the pathology of Menière's disease. This he thought to be owing to different pathological lesions, and therefore not a pathological entity. He recommended that this term should only apply to hæmorrhage into the membranous labyrinth, but not to hyperæmia or inflammation of that structure. The auditory neuritis in his case occurred in a patient suffering from progressive locomotor ataxy, the principal symptoms being vertigo and a roaring noise in the head, like thunder, or explosions of gunpowder, ringing of bells, and screaming of whistles. This lasted for a month during which time the hearing of the patient, which, until then, had been perfectly good, was gradually diminished, and at the end of the period mentioned he was found to be completely deaf. He ultimately recovered from all symptoms of ataxy, but remained stone-deaf. Dr. Althaus said that the auditory nerve was not simply a nerve of special sense, but had a distinct relation to the centres regulating the equilibrium of the head and the body. He described the functions of the cerebellum and semi-circular canals, and then analysed the pathology of the case, showing that there was no affection of Ferrier's auditory centre in the superior temporo-sphenoidal convolution, nor of the cerebellum, nor of the auditory nerve at the base of the brain, but of the labyrinthine expansion of the nerve, affecting the cochlea as well as the semi-circular canals.

The last subject touched upon was peri-neuritis of the portio dura, with special reference to such cases where the nerve suffers in the Fallopian aqueduct, when symptoms on the part of the chorda tympani, the Stapedian nerve, which supplies the levator tympani muscles, and the petrosal, or Vidian, nerve make their appearance. The importance of electric exploration, both by the Faradic and Voltaic current, of the suffering nerve and muscles, for the diagnosis and treatment of the affection was dwelt upon, and the author concluded his paper with remarks on the prognosis and treatment of the different forms of neuritis and peri-neuritis.

## ACADEMIE DE MEDICINE ET DES SCIENCES, PARIS.

At a recent meeting of this body, Professor Fizeau in the chair, an important communication was presented by M. Paul Bert,

### ON THE POSSIBILITY OF PRODUCING, BY MEANS OF PROTOXIDE OF NITROGEN, PROLONGED INSENSIBILITY, AND ON THE INNOCUOUS QUALITIES OF THIS ANÆSTHETIC.

This gas, discovered by Sir Humphrey Davy towards the end of the last century, is, at the present day, employed by many practitioners for the purpose of producing insensibility during dental operations. This insensibility cannot, however, be allowed to exist for any considerable length of time, for this reason: that the moment at which the desired degree of insensibility is gained, symptoms of asphyxia appear, which would soon lead to fatal results. For this reason, the American surgeons have not succeeded in performing lengthened operations on patients under the influence of protoxide of nitrogen, except by administering this gas in such quantities as to produce short, but repeated periods of insensibility, allowing the patient to recover consciousness between each period. This difficulty results from the fact, that insensibility can only be produced by causing the patient to inhale pure protoxide of nitrogen, without any mixture of air; it follows, therefore, that asphyxia and insensibility are produced at one and the same time. M. Paul Bert proposes to produce prolonged insensibility, obviating, at the same time, all danger of supervention of asphyxia. The fact, that protoxide of nitrogen must be administered in a pure state, signifies that the tension of this gas, must, in order that it may penetrate into the organism in sufficient quantity, be subjected to a pressure equal to that of an atmosphere. Under the normal pressure, it is necessary, in order to obtain this gas, that it should be in the proportion of 100 per cent. If we suppose, however, the patient to be placed in an apparatus in which the pressure is increased to that of two atmospheres, he may be subjected to the required tension by causing him to inhale a mixture of 50 per cent. of protoxide of nitrogen, and 50 per cent. of air; in this manner insensibility would be produced, while the normal amount of oxygen would be maintained in the blood, and consequently the normal condition of respiration preserved. "This," says M. Bert, "is what actually occurs." As yet, however, he has experimented on animals only. The following is his description of his manner of conducting this experiment: "I enter the cylinder, and there, with an augmentation of pressure equal to that of 1-5th of an atmosphere, I cause a dog to inhale a mixture of 5-6ths of protoxide of nitrogen, and 1-6th of oxygen, a mixture in which, as will at once be perceived, the tension of the so-called laughing-gas is exactly equal to that of an atmosphere. Under these conditions, in from two to three minutes, a very short period of agitation, the animal enters into a state of total insensibility; the cornea and conjunctiva may be touched without causing any movement of the eye, of which the pupil is dilated; a sensitive nerve may be laid bare and pinched, or a limb amputated, without causing the slightest movement; the muscular relaxation is extraordinary, and, were it not for respiratory movements, which continue with perfect regularity, death would appear to have ensued. This condition may continue for half an hour, or an hour, without any change taking place. During this time the blood retains its red colour and its richness in oxgyen, the heart its force in rhythmic action, and the temperature its normal state. Any excitation brought to bear on a centripetal nerve induces in the circulation and respiration all those phenomena of reflex action which would occur in the case of an animal in its normal state. In short, all the phenomena of the so-called *vegetative life* remain intact, while those of the animal life are for a time abolished; when, at the end of any given period of time, the vessel containing the gaseous mixture is taken away, the animal, at the third or fourth respiration, recovers almost immediately sensibility, volition, and intelligence, as is sometimes unpleasantly proved by the desire to bite the operator, frequently exhibited by it. When unbound, it moves freely, and rapidly recovers its original gaiety and vivacity. This rapid return to the normal condition, so different from the after-effects when chloroform has been employed, arises from the fact that protoxide of nitrogen does not, like chloroform, enter into chemical combination with the organisation, but is simply dissolved in the blood. As soon as the air inhaled ceases to contain this gas, it escapes rapidly through the lungs; this I have discovered by analysing the gases of the blood. The innocuous action of protoxide of nitrogen is clearly proved by these experiments. On the one hand, the anæsthesia affects only the medullary sensibility, leaving intact the reflex movements of organic life, the suppression of which, easily resulting through the employment of chloroform, can alone lead to fatal results. The harmlessness of this gas is still more decisively proved by the comparatively few accidents which have occurred from its administration in numerous cases by the dentists (the cases may be counted by hundreds of thousands), and the more so, that this gas has frequently been administered without prudence and by incompetent persons, under conditions in which the intervention of asphyxia would augment the dangers, if such exist, of anæsthesia. I feel myself, therefore, fully authorised through my experiments on animals in recommending to surgeons in the most emphatic manner, the employment of protoxide of nitrogen under pressure, when insensibility of long duration is required. I assure them that by measuring, according to the method already indicated by me, the barometrical pressure, and the centisimal composition of the mixture, in such a manner as to produce the pressure of an atmosphere for the protoxide of nitrogen, and the normal pres-

sure of the air for the oxygen, they will obtain as complete insensibility and muscular relaxation as they can possibly desire, with rapid recovery of sensibility, and consequently the perfect consecutive well-being of the patient. The method of administration is singularly convenient, as, in case of any of those slight inequalities resulting from special degrees of susceptibility between different individuals, which invariably occur, it is sufficient either to diminish or increase the barometrical pressure, and this may with ease be effected by means of a cork. I see but one serious difficulty, that of obtaining the necessary apparatus, which I must admit to be an insuperable one to army surgeons attached to regiments on active service. As the greater number of important operations take place in large towns, however, and as these are generally supplied with baths in which compressed air is employed, I confess I can see no great difficulty in providing in them a room large enough to contain the patient, the operator, and some dozen assistants, while the expense, some 12,000 francs, would not form a very formidable item in the accounts of any hospital. These difficulties, however, are merely questions of secondary importance, the solution of which concerns the surgeons who, in the future, will employ this anæsthetic; on them also will fall the burden of arranging those numerous questions of detail, which ever arise on the introduction of any new therapeutical agent. I have fulfilled my duty as a physiologist in pointing out this agent, in demonstrating the immense advantages which would accrue from its employment, and in insisting on its innocuous qualities, which can be explained with such wonderful facility."

## DANGERS TO HEALTH. (*a*)

We remember once examining a drawing of a scene during the French Revolution, in which one of the leading incidents was the figure of a man seated on a barrel of gunpowder, smoking with the most perfect *insouciance* a cigarette, perfectly regardless both of his own and his neighbours' lives. Such recklessness can only be stigmatised as foolhardy and criminal. This incident occurred during a period of popular frenzy, when Reason was temporarily dethroned, and Folly and Madness had full sway. At the present time, a supposed period rivalling the Golden Age in the spread of knowledge and the march of intellect, we can unfortunately equal the achievement of the fool on the powder barrel in the age of the Revolution, though not in quite a similar way. Families live in houses underneath which there is danger to life, as sure and fatal in its effects as the results produced by the explosion of a barrel of gunpowder. Men otherwise sensible and intelligent, rent or live in houses badly ventilated and badly drained, poisonous, and therefore unhealthy. They are utterly regardless of the perils surrounding them.

The world is flooded with sanitary literature. Medical men have preached for years the gospel of hygiene, the public sin, not through a lack of instructors, but through apathy and indifference to the most important questions of health and its preservation. How can we rouse attention to the necessity of healthy homes? Is it possible to make the public feel the importance of living in well-drained and well-ventilated houses? We believe it will be a Herculean task, though it may ultimately be accomplished by the persistent effects of sanitary reformers.

Instruction by the eye as well as by the ear has always been a valuable means of imparting knowledge, and Mr. Teale has hit upon this happy method of instruction in the work he has published, to illustrate the value of healthy homes, and to show the dangers arising from domestic sanitary defects. In an admirable introduction he has ably summarised the objects he had in view in writing this work, and though we are tempted to quote largely from it, we refrain, lest we might spoil the reader's pleasure by extracts which could give no proper idea of the nature of the whole. It should be read by every landlord, medical man, architect, officer of health, town councillor, poor-law guardian, members of parliament, in fact, by every householder in the kingdom; and not only read, but pondered and acted on.

Every page is pregnant with suggestive truths appealing to the intelligence through the eye. There are sketches showing how drains are badly constructed, how poisonous gases escape into houses, how death lurks beneath the foundations of the most beautiful buildings, how "man's inhumanity to man," through avarice and ignorance, is concealed beneath a fair exterior, and only revealed too late by the presence of sickness and death.

We should almost like to have an *auto de fé* of all the jerry builders, rapacious landlords, and contractors, who erect such houses as described by Mr. Teale; and though we are opposed to Lynch law, the men who deliberately and wilfully sacrifice so many valuable lives, are well deserving of the fate meted out to criminals in the backwoods of America. Criminals and assassins they are, though of a class to escape the vengeance of the law.

Mr. Teale has done good work in exposing some of the rascalities of the building trade, and we look, as he does, to an intelligent public opinion as the only practical way of suppressing the traffic engaged in by unscrupulous contractors. Knowledge is power. By the large circulation of this work we hope that a sound and healthy impression will be made upon the public mind.

## HANDBOOK ON THE DIAGNOSIS OF SKIN DISEASES. (*a*)

Within a space of 262 pages of moderate size, the reader will find in a condensed but clear and systematic arrangement the views held by the author respecting the diagnosis of cutaneous diseases. The introductory chapter on the study of Skin Diseases contains much valuable information, alike for the practitioner and student. Then follows a suggestive chapter on the elementary lesions of the skin, and their value for the purposes of diagnosis and classification. Dr. Liveing therein insists, 1. "Upon the necessity of assigning a definite meaning to the terms in use to express the pathological changes in the skin." 2. "That elementary lesions are liable to be over-estimated in value, for they are indicative of the stage or degree of inflammation, rather than of any particular disease." 3. That certain elementary lesions "occur infrequently, and these assume in consequence considerable diagnostic value."

Other special features of this handbook include: (*a*) chapters and tables of classification, of value in reference to the differential diagnosis of various cutaneous affections. These being more or less allied in character and symptoms, exhibit nevertheless, when carefully studied differentially, essential variations, both as to their etiology and classification, *e.g.*, Morbilli, Scarlatina, Rötheln. (*b*) References to plates of value to illustrate difficulties in the diagnosis of skin diseases; and by these the reader is directed chiefly to consult the Atlases of the Sydenham Society, Cazenave, Hebra, Fox, and Hutchinson. (*c*) A concise and valuable chapter on dermato-syphilis, which can be read with advantage beside the Harveian lectures on syphilis by Mr. Lane, and the experiences of the French syphilographers, Messrs. Ricord and Victor de Méric.

The author has carefully kept to the purpose of his manual, and is likely to receive the cordial thanks of the practitioner rather than the student. The condensation which the size of the work has necessitated, and the fact of it dealing with only a part of the extensive theme, viz., diagnosis, of necessity also requires some previous knowledge of the subject to enable the reader adequately to follow the author. We hope ere long Dr. Liveing may be able to present the profession with a more complete and comprehensive expression of his personal experiences of the diagnosis, etiology, prognosis, and treatment of skin diseases; and towards this, the present handbook affords a valuable contribution, which bids fair to pioneer for it a favourable reception. Should this be done, some illustrations will enhance the value of the text, especially for students.

## MEDICAL STUDENTS AND MEDICAL SCHOOLS.

THE article which Mr. Brudenell Carter has contributed to the current number of the *Contemporary Review* on "The London Medical Schools," will have the good effect of disabusing the public mind of any prejudices against the character of medical students, to which the recent scandalous remarks of Mr. Gilbert may have given rise.

It will be recollected that in the January number of the *Fortnightly Review*, Mr. Gilbert made the astounding assertion that medical students came more frequently into collision with the authorities than any other class of students; that it has been computed that during the past year no fewer than 400 out of the 2,000 medical students in London have come directly or indirectly under the notice of the police; and that, moreover, more medical students have misconducted themselves during the last winter sessions than the students of all other professions put together, not excluding those of the Universities of Oxford and Cambridge.

These statements of Mr. Gilbert are the more unpardonable, considering that he had not the slightest foundation for making them. He brought forward no facts, no statistics, no authority, in support of them; and he took no trouble to make any personal inquiries into the truth of any reports he may have heard on the subject. His opinions were couched in that loose phraseology which is so characteristic of the intemperate and flippant writer. He tried, moreover, to shirk all responsibility for these sensational statements, and insinuated, by such expressions as "it has been computed," "it is calculated," that he really had some good foundation for what he said. He did not, as Mr. Carter sarcastically, but justly remarks, inform his readers upon what data the computation or calculation was based; "nor even whether the arithmetician who worked out the result is a resident at Hanwell or Colney Hatch."

We need scarcely tell those who are familiar with the medical schools of this, or any other great metropolis, that there was not much difficulty in showing the injustice as well as the absurdity of the statement which the writer in the *Fortnightly* had presumed to make. But instead of being satisfied, as this writer was, with bare assertions, unsupported by any kind of evidence, Mr. Carter took the trouble to inquire for himself as to whether there was any foundation for the bold and systematic attack that has been made upon the character of a class of students to whose conduct the public can never be indifferent. "As the result," says Mr. Carter, "of inquiries addressed to the dean of every school in London, I find that there were in attendance at the several hospitals during 1878, 2,441 students, of whom only ten are known to have come under the notice of the police in the ordinary sense of the phrase. . . . I have asked the Chief Commissioner of the Metropolitan Police, whether the statistics of his office would lend Mr. Gilbert any support; and I am informed that the authorities at Scotland yard have no 'information on the subject.' As far as the police themselves are concerned, the very existence of those whom Mr. Gilbert represents to be almost a criminal class, is absolutely unknown to them."

Not satisfied with aspersing the general conduct of medical students, Mr. Gilbert cast serious reflections upon the maternity department of the London hospitals, asserting that the mortality among the female patients was greater than it should be, and that the habit of medical students attending midwifery cases while engaged in the dissecting rooms, was accountable for this increased mortality. Such a bare-faced mis-statement of facts might have been very properly dismissed with a few contemptuous remarks, but with regard to the alleged high death-rate at some of the hospitals, it is perhaps as well that Mr. Carter went so far as to "obtain extended statistics from every hospital in London." As the result of his investigations, he conclusively shows that in 17,066 cases there were only 67 maternal deaths—a death-rate of only 3·9 per 1,000; that the mortality of the St. Bartholomew's patients, instead of being, as was said, lower than that of other hospitals, is a little in excess of the average of them all; that the Royal Maternity Charity, which works among the same class of people by means of educated midwives, had in 48,996 cases, a mortality of 4·5 per 1,000; and that the midwifery work done by students from the schools is so much appreciated by the poor, that whenever a hospital school comes into competition with the Royal Maternity Charity, the work of the latter dwindles, this charity, indeed, being completely beaten out of the field.

The fact is, Mr. Gilbert, in giving such an untruthful representation of the modern medical student, drew partly upon his own imagination, and partly upon his reminiscences of the past; and not merely upon the past, as it was,

but upon the pastas it was caricatured by the comic writers and artists of the period. Even in those times Mr. Gilbert's description would have been very wide of the truth; now it is little better than a tissue of misrepresentation from beginning to end. Three circumstances have affected a very marked improvement in the *morale* of the medical student of the present day. The requirements of the medical examining boards are more exacting, and their examinations more difficult than they were formerly. Some of these examinations have to be passed in the middle of his curriculum, instead of being postponed to the end of it; and, what is most pertinent to our present argument, before he can be registered as a medical student, he has to pass a preliminary examination in proof of his having received a fairly liberal education. Consequently, the majority of medical students of the present day belong to a more respectable and a more educated class of society than was the case with the majority of students in former times; whilst, owing to the regulations respecting, and the higher standard of, the primary and pass examinations, he is less tempted to waste the first year or two of his hospital career in idleness and dissipation.

Although, however, Mr. Carter is fully justified in exonerating medical students from the aspersions that have been cast upon their moral character, we must not forget that as regards the social status of a large number of both students and general practitioners, there is much room for improvement. It cannot be contended that the social status of the majority of medical practitioners is quite equal to the social status of those who belong to the church or to the bar. We have still amongst us men whose acquirement sscarcely bespeak a liberal education, or are such as should claim for them admission into the ranks of a learned profession—men whose manners and whose professional conduct are barely characteristic of the well-bred gentleman—men whose knowledge of those subjects which form an essential part of a higher education, nay, even of the three R's, would scarcely carry them through a School-board examination. Even the preliminary classical examination which every person has to pass before he can be registered as a medical student, has not had such a salutary influence upon the educational and social position of medical men as might be supposed. Candidates still come up for their primary and pass examinations who have completely forgotten, if they ever knew, the most ordinary rules of the Latin Grammar, who are lamentably ignorant of their own language, and who, to crown all, are even guilty of misspelling what little they do know on any given subject. There is, however, every hope that these imperfections in the general scholarship, and the resulting inferiority in the social status, of a large number of medical practitioners will be before long removed. The exertions of the Medical Council in the cause of medical education, the imminent reconstruction of the Council itself, and the establishment of a Conjoint Scheme of examination for the three divisions of the United Kingdom, will no doubt do much to minimise the deficiencies above mentioned, and to make the general and professional acquirements of the humblest village surgeon second only to those of the fashionable physician.

## THE MORTALITY IN DUBLIN.

At length it would seem that public opinion in Dublin has been thoroughly aroused by the excessive fatality of the last few months, and by the exposures of which the Public Health Committee and its organisation have been the subject. Even that body has felt that the *status quo* requires some notice at their hands, and they have, therefore, made, through their supervising medical officers, an attempt—albeit a feeble and inconclusive one—to calm the public apprehensions, and to explain away the facts.

After all that we have said in derogation of the committee and its system, it is due to them that we should give to their "Report as to the Death-Rate of Dublin" as much publicity as our space permits; but it is also due to the public that we should point out the respects in which that Report entirely fails to satisfy us.

The first object to which the Report is devoted is to refute the prevalent belief that Dublin ought to be a healthy city on account of its salubrious situation. It says:—

> The situation of the city is not naturally so advantageous for sanitary purposes as the sites of Edinburgh, Birmingham, and most other large towns. Dublin is built on the estuary of a river, and close to a bay with flat, muddy shores, over which sewage is spread in enormous quantities. The basement storeys of a large proportion of the houses are below high water level, and the main sewers, owing to topographcial peculiarities, cannot continuously discharge their contents. We have it on the high authority of the Rev. Professor Haughton—equally eminent as a geologist and a scientific medical man—that Dublin, built, as he graphically describes it, on "the bottom of a mud valley," is naturally placed under most disadvantageous circumstances.

Much of this statement we question, but, presuming it all to be correct, we invite the authors of the Report to compare the death-rate of Dublin with that of other large towns, such as Glasgow and Bristol, which are also "built on the estuaries of rivers, and close to bays with flat, muddy shores." We invite them, also, to prove that "sewage" is spread "in enormous quantities" over these "flat, muddy shores," and, by a comparison of the death-rate of Dublin with that of Sutton, Clontarf, and Sandymount—suburbs which lie directly upon these shores—to show that these chimerical sewage banks are a direct cause of the excessive death-rate of the city. If it be true that the main sewers of the city cannot continuously discharge their contents, we venture to ask who, if not the Dublin corporation, is to blame for such a state of things. We have the utmost respect for the dictum of Professor Haughton, which this Report quotes with so much gusto, but we should have greater confidence in it if expressed in a formal manner and upon paper than when uttered as it was, in a period of after-dinner jovialty at the Mansion House. But, if that dictum means anything, it means that the conditions of Dublin sanitation are intrinsically bad, and that, therefore the energetic efforts of an intelligent and well-officered sanitary organisation are doubly needful for the protection of the city, and we want to hear of any single respect in which the Public Health Committee have showed themselves equal to the responsibility thus cast upon them by the learned Professor.

But the defence put forward in this Report entirely

begs the question. Is not Dublin where it always was? Were not the "mud valley" and the "flat, muddy shores" the same ten years ago as to-day? Is not the sewage now thrown into the Liffey just as it was ten years ago (and as it is likely to be ten years hence)? Alas! yes. How, then, are these conditions to blame for the steady increase in the Dublin mortality within the last five years? and what becomes of the Public Health Committee's geological excuse for their incompetency.

The Report proceeds:—

The unusually low temperature which has, with but few and brief intervals, prevailed since November in Dublin, has caused a very great increase in the mortality from diseases of the respiratory organs, and, together with a slight augmentation in the death-rate from zymotic diseases, caused by small-pox, fully accounts for the abnormal mortality of the fourth quarter of last year and the present month, so far as it has run.

During the past 16 weeks small-pox caused 183 deaths. Prosecutions for neglecting to have vaccination performed do not appear ever to be instituted in Dublin, though such neglect is very common. The Poor-law boards, and not the Public Health Committee have power to order prosecutions.

Fever was somewhat rife, 138 deaths being attributable to it. Cold, by producing overcrowding, conduced to this result; and during the prolonged frost a vast number of house-drains were not acting. Sewers are potent for evil, not for good, if leaky or badly trapped; and many householders, even in the best localities, fail to see that they are well made or well kept. The main sewer system has been greatly improved, and surpasses that of most towns of the United Kingdom.

Diseases of the breathing organs destroyed 986 persons; the average for ten years' corresponding sixteen weeks being only 541. The mean temperature of the past twelve weeks was 35·1, or 7 degrees below the ten years' average; and this accounts for the high mortality when the circumstances of our vastly numerous poor are considered. Their clothing, especially that of the feet, is bad, and their food scanty, because in a great degree their wages are spent in drink. Deaths from convulsions in infants increased during the quarter. The police statistics show 4,447 committals of females for drunkenness in 1876, as against 4,045 in 1866; and many deaths of infants by convulsions can be thus accounted for.

This paragraph is quite conclusive as an explanation of a part of the recent excessive mortality, but entirely futile as an argument in defence of the Public Health Committee. Undoubtedly the severe weather carried off many old people in Dublin, and *pro tanto* made the city appear inordinately unhealthy. But was not the weather as severe or more severe elsewhere? Were not the conditions which produce respiratory disease far worse in Scotland and parts of England than in Dublin? And yet the Dublin death-rate of the last three months nearly doubled that of these places. But if we were to admit that the present death-rate of Dublin is only apparently excessive as compared with the death-rate of previous years, we would still remain unsatisfied as to why the mortality of the most genial seasons is still—in Dublin—far in excess of that of other large towns.

It would seem that bad weather produces in Dublin a greater mortality than it produces elsewhere; but that circumstance is easily explained when we know the condition of sanitation in which the poor of the city are obliged to live. In English towns the population, though naturally class for class, as drunken, as dissolute, and as dirty as the Dublin poor can be, are, if not compelled to be clean, at least afforded a chance of being so. Their habitations are reconstructed, drained, watered, and scavenged by the sanitary authorities whether they like it or not, and their landlords are *compelled* to do all that can reasonably be expected in the way of sanitation. Accordingly, English poor children spend their lives in moderately pure air, and in reasonable domestic comfort, and reach manhood, as a rule, in robust health, and well able to resist the onslaught of a sickly or inclement season.

In Dublin how different is all this. The scavenging is notoriously disgraceful. The tenement houses in which the poor live are the dilapidated mansions of the past century, which, built in the first instance without any idea of sanitation, have fallen into such a state of decay, filth, and miasm as to be simply indescribable—leaking roofs, wet floors and walls, rotting timbers, hermetically closed windows, obstructed sewers, usually no water supply, no ashpit, or else one brimming full of putrid offal, except on the rare occasions when the landlord pleases to empty it. In such dwellings the empire of stench and disease must be, and is, complete and despotic. In such places the puny infant of broken-down parents draws his first poisoned breath, and thenceforth knows none of the cares and comforts which make a healthy man. Is it any wonder that he is stricken by the first epidemic of fever or the first access of bad weather?

But who is to blame for all this? We reply emphatically the sanitary authority, the Public Health Committee of the Dublin Corporation. It is empowered by the 25th and 26th section of the Public Health (Ireland) Act to enforce proper drainage, by the 44th and 45th sections to compel the construction and cleansing of latrines, by the 83rd and 84th sections to forbid the occupation of cellar dwellings, by the 87th to inspect lodgings and enforce all sanitary necessities therein, by the 110th to deal with all nuisances. They have full power to undertake domestic scavenging at the expense of the householder; to make house drains and compel him to pay for them. In fact, the law has given to the committee the means of completely reforming the sanitary state of houses without a shilling additional expense to the ratepayers. These powers they have possessed for years, but have refused to avail themselves of them.

Are we not, therefore, justified in holding the Public Committee fully responsible for the abominable state of the city, and for the lives sacrificed to filth diseases within its walls? We shall return to the question next week.

## HABITUAL DRUNKARDS UNRECLAIMABLE.

The assertion of Dr. Moxon that habitual drunkards are rarely reclaimed has given great umbrage to those total abstainers and "temperance" writers who have been looking forward to a millennium of teetotalism. Dr. Moxon's dictum has been gainsaid in various quarters, and his attention has been drawn, especially by the Rev. G. M. Murphy, to the many drunkards who have been cured of their intemperate habits. It is probable that this physician, as he himself admits, speaking from his experience of the later stages and more severe forms of drunkenness, may

have taken a too gloomy view of the possibility of reforming this unfortunate class of people. The fact is, their reformation depends in a great measure upon the kind of drunkard and stage of drunkenness dealt with. There are drunkards and drunkards. The general concensus of opinion among medical men, and, indeed, of the public in general, is to the effect that the confirmed habitual drunkard —the so-called dipsomaniac—is rarely or never permanently reclaimed. This is especially the case with women, so that we constantly hear members of the profession saying that, "they have never known a female drunkard to be cured of her propensity to drink." We should, therefore, advise our temperance reformers to address their laudable efforts rather to the prevention than to the reclamation of habitual drunkards. The old adage that "Prevention is better than cure" is as applicable to the moral as it is to the physical evils of mankind. At all events, we doubt whether the way in which the total abstainers are setting about the reformation of our drunken population is quite in the right direction. Dr. Moxon has incurred the severe displeasure of his critics by saying—"For teetotalising A, the good man, to save B, the sot, is throwing good after bad; the sot is not worth it." We fancy from the tone of his answer to the Rev. G. M. Murphy that Dr. Moxon may feel inclined to revoke an expression which the *Medical Temperance Journal* has characterised as "inhuman sentences," and as "nauseous and contemptible." We think he would be wrong in doing so, and for the following reasons. It may be seriously doubted whether all the recent agitation and all the publications in favour of total abstinence are sensibly diminishing the prevalence of intemperance. Never was there a time when the subject attracted so much attention, or occupied so large a part of the literature of the period as it is now doing, and never was there a time when intemperance has been so prevalent among both sexes in the lower classes, and among the female portion of the middle and upper classes of society, as it is at the present day. While our library tables are loaded with temperance journals and temperance pamphlets, while English and American writers are vying with each other in their crusade against this great blot upon modern civilisation, and while many eminent London physicians and surgeons are, through the medium of a high-class journal, discussing the question as to whether total abstinence or temperance is best for the people, our medical periodicals are crowded with advertisements of proprietors of private reformatories for "dipsomaniacs," and our prisons and our asylums are largely recruited by persons whose crimes or whose madness are to be attributed to alcoholic indulgence. When the total abstainers tell us that "at least 40,000 drunkards, and 120,000 victims, either directly to their own indulgence, or indirectly, to the intemperance of others, die annually in our fatherland," they forget that they are stating a fact which tells against as well as in favour of the probable success of the difficult task they have undertaken, or, at least, of the means by which they would attain the object they have in view. That this great temperance revival may ultimately have a beneficial influence upon the morals of the people we will readily admit, but its prospects must be regarded from a preventive rather than from a curative point of view, and belong to the next rather than to the present generation. We look upon it as the outcome of that spirit of philanthropy which is so characteristic of the age rather than as the best way in which that philanthropy can be brought to bear upon an evil the removal of which cannot be too earnestly desired. To return, therefore, to the rather unguarded expression above-mentioned, we do not hesitate to say that even from a humanitarian point of view it is far from being indefensible. It is a trite saying that we must be sometimes "cruel to be kind." We doubt whether the established drunkenness of the present day should not be treated in a very different manner to that in which some sentimental reformers propose to treat it. We doubt whether the confirmed sot should be petted and pampered, any more than a hysterical girl should be petted and pampered. The more care that is taken of him (except in the way of forcible restraint) the less likelihood there is of his taking care of himself. Let him be punished so far as it is possible to punish him. Let him see that he is an object of aversion and disgust, not only to society, but to those nearest and dearest to him. Let those who are on the same road to ruin see that there is little pity and less help for him who has entered upon a career of dissipation and drunkenness, and we are persuaded that there would then be fewer drunkards amongst us. Those who have already given way to intemperate habits would be less disposed to continue them; those who are as yet sober-minded would be more deterred from contracting them. Such a Draconic method of dealing with drunkards may at first sight appear very unchristian, but we doubt whether it would not be the most practical and the most successful.

## PRISON APOTHECARIES IN IRELAND.

THE dispute which arose many months since in reference to the imposition of the duty of Apothecary upon the Surgeons of Irish Prisons, has as yet received no settlement, and the question remains in a most unsatisfactory condition. Most of the surgeons are also—and under the old law, must necessarily have been—surgeons to the County Infirmaries, and therefore occupied a position incompatible with drug dispensing. Many of them are Fellows of the Irish College of Surgeons, and, therefore, forbidden to accept a salary for such a duty, and almost all of them are unable to perform apothecaries' duty, never having learned or practised the art, and being fully engaged in private practice. The prison surgeons, moreover, hold that it is perfectly illegal to impose upon them this duty, and they are fortified in this view by the opinion of Mr. Purcell, Q.C., which was obtained for them by the Irish Medical Association. That opinion, which we publish below, is quite explicit, so that it would seem that the Prison Surgeons who are disposed to maintain their position can do so:—

QUERIES SUBMITTED ON BEHALF OF THE IRISH MEDICAL ASSOCIATION TO T. A. PURCELL, ESQ., Q.C., AND HIS REPLIES THERETO.

(1.) Whether the conduct of the General Prisons Board in attempting to enforce the duties of an apothecary and the compounding of medicines upon those medical officers who were appointed before the passing of the late Prisons Act, is not a violation of the 40 & 41 Vic., c. 49 (Prisons, Ireland, Act), and consequently illegal?

(1.) In my opinion the General Prisons Board has no

power to impose upon medical officers appointed prior to the passing of the Prisons (Ireland) Act, 1877, the duties of an apothecary, or to compel them to compound medicines.

(2.) Should a medical officer, appointed before the passing of the Act, refuse to undertake the duties of an apothecary in addition to his previous duties as medical attendant, can the General Prisons Board dismiss or otherwise punish such medical officer on account of such refusal?

(2.) In my opinion the refusal by a medical officer appointed prior to the passing of the Act, to undertake the duties of an apothecary would not constitute a legal ground of dismissal by the Board.

(3.) Should the Board dismiss, or attempt to dismiss, such medical officer for refusing to act an an apothecary aforesaid, what redress has he, and what legal proceedings by, or on behalf of, the said officer, and against whom would Council advise?

(3.) Should the Board dismiss such medical officer on the ground of his refusal to act as an apothecary, I am of opinion that an action would lie by the medical officer against the Board to recover damages for such wrongful dismissal, and that he would be entitled to a mandamus to be restored to his office.

(4.) Have medical officers a legal right to elect to retain their offices on the terms of the old Act—7 Geo. IV., c. 74, and can the General Prisons Board in any way prevent their so doing?

(4.) I am of opinion that they have, and that the Board can dismiss them only for incompetency or misconduct.

The question has been brought to a crisis by the resignation of Dr. Boxwell, the Surgeon to the Wexford Infirmary and Gaol, who sacrificed his office sooner than submit to the imposition of the new duties. The Prisons Bill passed on the 1st of April, 1878. Dr. Boxwell, having exhausted six months in remonstrance, resigned on the last day of October. For his services during the intervening period, he claims 191 guineas, being at the rate of a guinea a day. The reply which he received is one of the coolest documents we have ever read. It informs Dr. Boxwell that his claim has been submitted to the Law Adviser, and that it is that gentleman's opinion that Dr. Boxwell "is not legally entitled to claim *any salary or remuneration.*" That after April, 1878, "the appointment vested in, and still remains with the Lord Lieutenant, who is entitled to fix the remuneration, subject to the consent of the Treasury;" that if Dr. Boxwell "thought fit to continue to act without appointment, he cannot legally claim any salary." That it is for the Prisons Board to say whether, under all the circumstances, they would recommend His Grace to advise any time to be given. That the question of the amount of salary to be paid to the new medical officer of Wexford prison, is at present under the consideration of the Treasury, and when a decision is come to, Dr. Boxwell will be paid at the same rate for the period for which he claims.

This conclusion is very suitable to the views of the Prisons Board, but unfortunately for the view of the Law Adviser, there is a special clause in the Act which preserves to the prison officers all their rights, immunities, and privileges, and Mr. Purcell, Q.C., advises that no one has any power to unseat them so long as they do the duty imposed upon them by the Act:—

27. *Position and Duties of Existing Officers of Prisons.*—The officers attached to prisons on the first day of April, 1878 (in this Act referred to as existing officers of a prison), shall hold their offices *by the same tenure, and upon like terms and conditions, as if this Act had not passed*, and shall receive salaries of not less amount than those which they have hitherto received.

From and after the first day of April, 1878, no surgeon of the infirmary of any county shall be bound or required as a condition precedent to the making of any presentment for his salary as such surgeon under the provisions of the 86 Sec. of 6 & 7 Wil. IV., c. 116, to give his attendance or assistance to the prisoners in the gaol of such county; but no such surgeon shall be entitled, save as provided by Sec. 34 of this Act, to any compensation, gratuity, or allowance whatever, by reason of the discontinuance of any attendance or assistance at any gaol which, but for the passing of this Act, he would have been bound to give as a condition precedent to the making of a presentment to him for his salary as surgeon to the county infirmary under the provisions of the said Section.

As to the refusal of the Board to pay Dr. Boxwell, all we can at present say is *nous verrons.*

The first new appointment has just been made under the new Act, Dr. Palmer having been appointed to the Armagh Infirmary and Prison, on condition of his undertaking to compound the medicines. The Board has perfect power to make such a bargain with a new officer, but no authority whatever to force it upon one of the officers of the old system.

# Notes on Current Topics.

## The Dental Mob.

A CONTEMPORARY draws the following charming picture of the chaos to which the Tomes-Lubbock Dental Practitioners Bill and the negligence of the General Medical Council have reduced the profession of dental surgery.

"The period during which persons entitled to be registered under the Dentists Act could be registered on payment of a fee of £2 expired with the year 1878, and at the last there was such a rush of applicants that close upon five thousand 'dentists' have now been 'conditionally' placed on the Dentists' Register. It is known that very few, comparatively, of these persons possess a licence in dental surgery; and it seems impossible to believe that all, or even nearly all, the rest were '*bona fide* engaged in the practice of dentistry.' No effort of any kind has been made to protect the Register against the admission of any person whose conscience, or ignorance, permitted him to make application in the form prescribed by the Act. Are the five thousand already admitted to the Register to be permitted to remain on it? It is said that they are only 'conditionally registered,' and that the Register will be purged of those who have no right to be upon it. But how and when is this process to be effected? The only machinery for exercising the power of erasure from the Register is a Committee of five of the General Medical Council; and how are they to obtain evidence of incorrect or fraudulent representation? We have received a pamphlet giving an explanation of the Act by Mr. Tomes. 'Very speedily after August 1, 1879,' he tells us, 'the Dentists' Register will be published, and then will come

the time of reckoning. The dental practitioners are the only persons who, in their respective localities, know the persons who are in *bonâ fide* practice as dentists. It will be for them to look over the Register so soon as it is published, and, if names are found therein which have been wrongfully entered, the facts of each case must be collected and transmitted to the Registrar of the Medical Council.' It will truly be an edifying spectacle to see registered dentists trying to oust each other from the Register ! and what a work for those members of the Medical Council who may be appointed on the Erasure Committee ! According to Mr. Tomes, all who have obtained admission to the Register wrongly are safe till next August at any rate ; and how much longer after that time will it be before an expurgated Register is published ? "

The *fiasco* is positively laughable to every one but Mr. Tomes, Sir John Lubbock, and the unhappy victims of toothache, for whose behoof the framers of the Act took upon themselves the task of discriminating between the competent and incompetent.

But Mr. Tomes and the Dental Reform Committee need not promise themselves the gratification of wiping out the "*bona fide*" druggists whom he has enrolled. On the Register these gentry are, and there they must stay, for we assert, without fear of contradiction, that no one except the makers of the Act can unseat them. There is no power whatever given to any conclave to decide the *bona fides* of dental practice. The Committee of the General Medical Council might, if it wished, administer before registration a perjury oath to every registered dentist, but, when that oath had been taken, they would have no power whatever to strike off the name. The *fiasco* is complete. Nothing but an Act of Parliament can remedy it, and that only by disrating the whole list, and restoring matters to the *status quo* of six months ago.

We fear it is not likely to be done, but nevertheless, the alternative is better than to wait for (say) thirty years until the Tomes-Lubbock druggist-dentist has gone to his rest. Until then, the Register cannot be otherwise purified.

Meanwhile the "ill wind" which has wrecked the Dental profession has "blown good" to the General Medical Council. That body has received altogether £9,460 in dental registration fees, and has banked £8,655 free of all outlay. If Mr. Tomes's promised expurgation of the list takes place, of course, most of the cash must be handed back. We fear that that gentleman will not find it easy to convince the Council of the propriety of that arrangement.

## A Post-Mortem Under Difficulties.

At a recent inquest in Newry the coroner directed Dr. Crossle to hold a *post-mortem* examination of the remains. The doctor proceeded to the residence of the deceased to hold the examination. At the door of the house he was met by the father of the dead boy, who, with a large knife which he brandished, threatened the life of the doctor if he dared to enter the house. The doctor returned to the inquest and communicated the state of affairs to the coroner, who directed that the police should accompany Dr. Crossle to the house, remove the father, and make the necessary examination. Accordingly, the police and the doctor visited the house again, and this time the man was even worse than before, and the two members of the constabulary were obliged to retreat before the open knife. A message was sent to the barracks for extra men, who came down armed, and after some resistance, the father, who was in a state of great excitement, was captured and removed, and the examination proceeded with.

## The Lectures at the London College of Surgeons.

Prof. Parker will commence his course of nine lectures "On the Evolution of the Vertebrata," on Monday next, the 10th of February. Prof. Flower will then deliver nine lectures "On the Comparative Anatomy of Man," in continuation of his course of last year, commencing on Wednesday, the 5th of March next. And in June next Prof. Jonathan Hutchinson and Mr. B. T. Lowne will complete the lectures for the present year, the former by a course of six lectures "On Certain Diseases of the Eye, Skin, and Joints, which are produced through the Influence of the Nervous System," and the latter by three lectures "On the Physiology of the Nervous System," in continuation of his course of last year.

## M. Chauffard on Bloodletting.

Apropos of some interesting clinical remarks on this subject, by Professor Wharton Jones, to which we recently drew attention, we observe that a French writer has a favourable opinion of this remedy in cases in which it is now seldom employed. M. Chauffard (*La Presse Medicale Belge*), thinks that phlebotomy is at the present day often neglected in cases where it might be found very useful He lately had under his care in the hospital, a young man twenty years of age, robust, moderately stout, and rather plethoric, who, after enjoying good health, had a severe attack of hæmoptysis. By occupation he was a stonecutter, and doubtless the attack had been excited by the irritation caused by the inhalation of the dust. The symptoms having lasted for three days without any signs of improvement he entered the hospital. After examining the lungs and finding them free from any serious disease, M. Chauffard prescribed bloodletting to the extent of 500 grammes. The result was very remarkable, for the hæmoptysis, which had continued up to the time of the operation, ceased immediately afterwards. His appetite and strength soon returned, and the blood so quickly recouped itself that no trace was left of the double loss it had undergone. It may be observed that the above is the inverse of what takes place in those cases in which a suppressed normal hæmorrhage gives rise to one that is vicarious of it. It is not, however, merely the accidental attack of hæmorrhage that may be arrested in this manner, for it should be borne in mind that the hæmorrhagic molimen to which by habit an organ has been subjected may be a source of danger. For instance, one of the most useful applications of bloodletting is the prevention of those catamenial congestions which persist after impregnation, and which lead to the separation of the ovum. It is, in fact, one case of

sterility that is often overlooked. M. Chauffard says that his father used to relate several cases of this kind in which, by means of bleeding, and by bleeding alone, he was able to carry patients to the full time of utero-gestation who had been previously childless. M. Chauffard himself recalled a case in which a lady of Besançon who had for ten years consulted several physicians of repute for the treatment of her sterility, but all to no purpose. She was of a florid complexion, rather flat, and plethoric. The catamenia had always been perfectly regular and very abundant; nor did there appear anything in respect of either herself or husband to account for her sterility. M. Chauffard was convinced that impregnation had taken place more than once, but that it had been rendered abortive by the abundant hæmorrhage which the impregnation could not stop. In accordance with this view of the cause, every month on the eve of the day on which the catamenia were expected to return, a small quantity of blood was taken from the patient, and on the day following the bleeding was repeated. At the end of nine months her first child was born, and subsequently she had several others. There is nothing, observes M. Chauffard, very extraordinary in the above facts; but the practitioner would do well to bear them in mind, for this is by no means an uncommon cause of sterility, especially in patients of a plethoric habit of body.

## Constitutional Variation of Races.

At a recent meeting of the Société de Biologie, Paris, M. G. Delaunay observed that among the lower classes of animals, individuals belonging to the same species, sex, and age differ very little from each other, either in an anatomical or in a physiological point of view. On the other hand, the higher races of animals, and especially the human species, present a great variability of constitution. But in the human species this difference only or chiefly obtains among the higher races. All savages, belonging to the same tribe, closely resemble each other in form, in strength, and in intelligence. But in the higher classes of mankind we have a primitive type replaced by multiple and various types of men—individuals differing so much from each other that it is impossible to find two persons absolutely alike. From a sexual point of view, we find more variation among the males than among the females of the same race. This is especially the case in the human species, among the male portion of which there is a much greater diversity of constitution than there is among the female portion. With regard to age, nearly all infants resemble each other, both physically and morally. Moreover, all old men have the same weakness of constitution, the same feelings, the same tastes, and the same childish notions. On the other hand, adults present among themselves the greatest variation. With regard to constitution, the strong and the intelligent differ from each other much more than the weak and unintelligent. From these facts M. Delaunay draws the following conclusions:—That the differentiation of constitution being much greater among the higher species and races of animals, among adults than among infants or aged individuals, and among the physically and intellectually strong than among the physically and intellectually weak—in short, amongst individuals the most advanced in the evolution of their species—this differentiation is a direct consequence of evolution; and, moreover, a direct consequence of nutritive and functional changes that have slowly and gradually taken place in the development of the species.

## The Treatment of Diphtheria by Large Doses of Calomel.

M. C. Ruter, M.D., of Pittsburg, advocates this treatment in a paper published in the *Canada Medical Record*, May, 1878, page 188. His views of this disease and its treatment are based upon the conviction that the disease is not a poison of the blood, or in the blood, but an excess of fibrin, called, in old times, the inflammatory diathesis! He recommends calomel to be given freely and boldly every hour, until the intestinal discharges resemble the fresh-water polypi in water-troughs, gelatinous, and of a bright dark-green hue; if salivation is feared, he recommends a dose of castor-oil. He has never seen ptyalism in a single case, nor prostration when the true nature of the disease has been diagnosed.

He gives 10 grains every hour to a child of three years of age, and still larger doses to adults! The calomel must be given pure, the following being the method of administration he adopts:—

"Fill a teaspoonful full of cold water (iced in summer), drop the calomel on to the surface of the water, and then tumble it down the patient's throat at once." The calomel is not to be mixed with the water, nor placed in the spoon before adding the water.

He gives the particulars of several cases treated successfully (?) this method, when the prognosis was exceedingly doubtful.

## Puncture of Hepatic Abscess.

Writing on this subject in the American journals, Dr. W. A. Hammond insists that "puncturing the liver with the needle of the aspirator is not a dangerous operation, if it be performed early and at the right place." In support of this opinion he quotes Dieulafoy, who showed that this operation was comparatively free from danger, even when due regard was not paid to point of election or time of operating; Zimency, of Mexico, who has performed the operation many hundreds of times, using only a common trocar, and yet has never seen the procedure followed by peritonitis or other trouble; and Dr. Davis, who also had a large and similarly favonrable experience of this operation. Dr. Davis condemns the practice of waiting until adhesions have formed between the liver and walls of abdomen; the patient's strength becomes exhausted and his constitution undermined before relief is given. Since, in his opinion, exploratory punctures are not followed by any ill effects, such a procedure is perfectly justifiable on the surgeon's part, and early relief should be given. The second point is, that "the right place for the operation is through an intercostal space at a point not far from a line let fall from the middle of the right axilla." The reason is that the place of puncture in the liver is brought, in withdrawal of the trocar, into apposition with the unyielding walls of that portion of the abdomen, and all escape of fluid into the peritoneum is prevented, an advantage not possessed by a more forward position. The choice of intercostal space, whether eighth

ninth, tenth, or eleventh, must be guided by circumstances; the ninth is the most usual position for operating. Dr. Hammond is certain that abscess of the liver is a much more common disease in America than is ordinarily supposed, and that patients die of it without the real cause of death being recognised. To sum up, Dr. Hammond agrees with those who believe that puncture of the liver is a comparatively speaking harmless operation, and that it is perfectly justifiable to resort to it whenever abscess of the liver is suspected on fairly good grounds, and in support of this opinion he appeals to the test of clinical experience, both in his own practice and that of perfectly reliable brother practitioners.

## Plane Sections of Frozen Bodies for Demonstration and Examination.

THE *Lancet* says that this most important method of anatomical illustration is being carried out at the Royal College of Surgeons of England. Subjects, whose vessels have been carefully injected with coloured plaster-of-Paris, are placed in zinc-tanks, surrounded with ice and salt. In a few days they are frozen so hard that sections are readily made with a common saw. The sections now being made are both horizontal and vertical, and will well supplement the splendid collection of normal human anatomy which is daily being added to in the museum. We are not aware whether it is contemplated using the sections for the examinations, or whether they are to be merely for reference or for the completion of the anatomical series. We cannot imagine such an examination as the Fellowship complete without involving an acquaintance with the plane sections, and we think that every school museum should have its *répertoire* of such specimens, which can be so easily and cheaply made. The works of Pirogoff, Braune (translated), Legendie, and others, will give all requisite directions.

## The Influence of Gas-light on the Eyes.

WE observe that the German Minister of Instruction, in a report on the influence of gas-light on the eyes, concludes that no evil results follow a moderate use of gas, if the direct action of the yellow flame on the eyes is prevented.

This verdict, we presume, will contribute towards the eradication of the venerable but universal delusion that there is a special indiscretion in the use of gas as a means of illumination. The fact is, that gas—if used with the same discretion—is neither better nor worse than other lights. A twenty-candle volume of gas is just the same as twenty candles placed very close together, and is no more or less injurious to the eyes. People have been in the habit of comparing a twenty-candle volume of gas, placed immediately over their heads and close to their eyes, with the light of four candles placed at various distances about the room, and the discomfort caused in certain cases of the excess of light and the heat has been debited to the gas.

Another cause for the opprobrium of gas in the minds of old people is, that when they reach the age of presbyopia they can read small print with ease in daylight because they have sufficient light to enable them to place it at a distance. In the evening they are forced to bring it closer to the eye, and thus they throw a strain upon their ciliary muscle which causes watering of the eye, and this they charge against the gas as one of its sins. Gas needs to be burned in moderation, to be well ventilated, and to be used at the proper distance; but when thus employed, it is as good as other lights, and much better than some.

## Suicide by Poisoning with Aquafortis near Sligo.

LAST week Dr. Wood, coroner for Sligo, held an inquest in the County Infirmary on the remains of a man, about forty-five years of age, named Thomas Hyland, who died in that institution, having, it is supposed, committed suicide by drinking aquafortis. The deceased man was a stranger in the neighbourhood, and very little could be gathered respecting antecedents. The only clue which appears is that he was out of employment; and in his desponding state of mind, he probably fancied himself utterly forlorn and wretched in a strange town without money or friends.

## Cost of the Paris Hospitals.

FROM a table of the comparative annual expenses of the Paris hospitals and hospices, published in the *Union Médicale*, we extract the following figures. At the Hôtel Dieu, with 514 beds, the annual expense per bed is 1,194 frs. (nearly £48); and at La Charité, with 472 beds, it is 1,096 frs. (nearly £46). The Clinique, with 74 beds, is the hospital which costs most, viz., 1,847 frs. (£73) per bed; and the Ménages, with 1,387 beds, is the hospital which costs least, viz., 399 frs. (£16) per bed. The department of the Seine has twenty-seven hospitals and hospices, which contain 18,000 beds, the mean annual expense per bed being 877 frs. (£35). These sums are entirely for maintenance, and do not comprise the interest on capital employed.

## Uncooked Food as Diet.

A GERMAN physician has started a theory that all food should be eaten raw, as all the nutritive qualities meat and vegetables possess are in a great measure, if not entirely, destroyed by cooking. Persons afflicted with gout, rheumatism, or indigestion are advised to try uncooked food, such as oysters and fruit, and they will find all medicines unnecessary. The yearning for drink, says this German philosopher, is caused by the unnatural abstraction of the aqueous element from the "solids," which, as in the case of uncooked beef, for instance, amounts to seventy or eighty per cent. All this might pass, and be deemed worthy of consideration, but when the same learned pundit goes on to say that clothes are a mistake, most people will give him up. Apart from appearances being against him, the recent severe weather is not favourable to his theory.

A MOVEMENT is on foot in Dublin to establish a Convalescent Hospital for small-pox cases, and several subscriptions have already been received for the purpose.

## Punishment before Conviction.

A story of a strange and cruel experience that has happened to an Italian pharmacist reaches the *Pharmaceutical Journal* from Rome. In 1873 this person, whose name is Francois Amato, was charged with poisoning a man named Grossi by means of henbane, and for five years he has been lying in prison awaiting his trial. When at last this took place, two questions were left to the jury, Was the dead man poisoned at all? and if so, Was the prisoner guilty? The jury answered the first question in the negative. The judge, addressing the prisoner said, "Amato, not only does the verdict of the jury exculpate you, but it declares that the crime of which you have been accused has never been committed." The audience applauded vehemently, whilst the poor pharmacist, who had borne his five years of "preventive" imprisonment with great patience, staggering like a drunken man under the shock, was just able to murmur his acknowledgments, "Thanks, gentlemen; thanks to you all!" Surely he was thankful for small mercy.

## The Physiological Action of Coffee.

Prof. Binz has been making some new experiments on this subject. He found that very large doses not only raised the temperature, but caused death by convulsions; but the latter could be averted by artificial respiration. Moderate doses of caffein raised the blood-pressure, the effect being the same whether the pneumogastric nerves are divided or not. Prof. Binz has also examined the effect of caffeoon, the name given by Boutron and Frémy to the volatile products developed in the coffee-bean by roasting, and he finds that it acts, like caffein in moderate doses, as a stimulant to the brain, the heart, the respiration, and the heat-producing apparatus. He agrees with Hoppe-Seyler and Voit, that an ordinary infusion of coffee slightly increases rather than diminishes tissue-change. In any case, the influence it exerts in this direction is very trifling. The potassium salts contained in coffee are probably of no physiological importance.

## Ovariotomy.

A case of ovariotomy having occurred in the hospital practice of Professor J. Gaillard Thomas, of the College of Physicians and Surgeons, New York, the plan of treatment successfully adopted by him is worth noting, and is as follows, given in his own words:—

By my direction one of Dr. G. W. Kibbee's fever cots, which is provided with a webbing or network instead of the ordinary canvas used in cots, was brought, and a folded blanket placed over the meshes of the latter. The patient was then placed on it, with her night dress gathered up under her arms, and her whole trunk enveloped in a sheet. This was kept saturated with cold water, which an india-rubber cloth, conveniently arranged, prevented from wetting the floor. In one hour the temperature had gone down to 102 deg., in two hours to 100 deg.; and during the course of the evening it fell to 97 deg. The pulse also went down in a corresponding manner. The patient has now been kept in this wet-pack for nearly a week, and whenever the temperature has shown a tendency to rise fresh applications have been made, and always with the result of at once reducing it. To-day her temperature is 97 deg. and her pulse 110 to 115; so that I think she can safely be pronounced out of danger.

## Extraordinary Birth.

John Perrins, M.D., Boston, Mass., reports an extraordinary case of this nature. On the 14th June, 1878, Mrs. J., a Swede, æt. 27, a primipara, weighing 135 lbs., was delivered instrumentally of an enormous child.

"About twelve hours after birth the child was weighed and measured, with the following results:—Weight, 19¾ lbs.; height, 25¾ inches; circumference of head, 16¾ in.; neck, 9¾ in.; shoulders, 19¾ in.; hips, 17¾ in.; arm, humerus, 9¾ in.; thigh, 10¾ in.; length of neck, after all the pulling it got, 1 in." Delivery was accomplished with the greatest difficulty.

## Chloroform Impurities and Dangers.

It is considered by M. Perrin (*Les Mondes*) that chloroform, as an anæsthetic, has become much less reliable and more dangerous of late years. Sleep is often difficult to get with it, and he mentions some cases in which the attempt had to be given up, after trying successively the drug procured in several shops. It often produces disorder of the stomach, moreover (vomitings, &c.), and twice in his recent experience it caused a state of apparent death, which was followed with extreme exhaustion. M. Perrin examined some of the samples of chloroform used by means of sulphuric acid; they took a fine red mahogany tint, indicating impurity. This chloroform, rectified by M. Regnault's process, gave very satisfactory results. No accidents complicated the anæsthesia, and everything occurred in the usual way. He recommends his colleagues in hospitals to follow his example, and urges the necessity of changing the mode of manufacture.

## Viper Poison.

An interesting observation has been made by M. Lacerda with regard to the poison of serpents. It has been generally thought that the venomous matter some species secrete is merely a poisonous saliva, acting like soluble ferments. The facts M. Lacerda has observed seemed to prove, on the contrary, that this matter contains *figured ferments*, having remarkable similarities to *bacteria*. Filaments of protoplasmic matter were observed, of arborescent form, and composed of cells. Spores were set at liberty, which, under favourable conditions, enlarged and gave off a small growing tube; this separated and formed another spore which was reproduced in the same fashion, &c.

## The End of a Dublin Advertising "Doctor."

"Dr." Mulvany, whose advertisements have been for many years before the Dublin public, not only on the walls of the city but also in some of our daily contemporaries, whose columns are often garnished with quack announcements, has terminated his existence by his own hand—having, in a quarrel with his wife, seized a double barrelled fowling-piece, and after dangerously wounding her, discharged the second shot into his own mouth, which

proved fatal after a day's suffering. It appears that the deceased was a man of a most excitable temper, and it may be in the recollection of our readers was not very long since prosecuted for an assault committed by him on Dr. Johnston, the then Master of the Rotundo Hospital, at a time when Mulvany's wife was an inmate of that institution.

## Appropriation of Oxygen by Animals and Plants.

VARIOUS researches on the process of respiration in animals have proved that the oxygen of the air, on its entrance into the blood, is first loosely bound by the hæmoglobin of the blood corpuscles and conveyed to the tissues, where the process of oxidation occurs in a more active, ozone-like condition. It now appears probable, from observations of Mr. Jamieson, of the Royal Society of Victoria, that in plants also, the absorbed oxygen is transformed into ozone or a more active form. Sections of ripe fruits not having reached the stage of decomposition, showed the ozone reaction both with tincture of guaiacum and with iodide of starch. In this form the active oxygen is apparently conducted to the tissues to be oxidised, as in animals. To what substance the oxygen is temporarily united, or what plays the *rôle* of the hæmoglobin in animals, does not appear, but it can be shown that it is not chlorophyll.

## Burning an Hospital Ambulance.

A CASE has recently been reported to the Irish Local Government Board of an outrage perpetrated at the Small-pox Hospital, Loughrea. The Board of Guardians, to be prepared for any emergency, had an ambulance ready in which was a bed to convey cases that might be reported anywhere in the union to the fever hospital. At 2 o'clock in the morning, when the two nurses attending the patients in the hospital looked out they discovered the ambulance in a blaze, some miscreant having set it on fire. With great presence of mind the nurses pushed the ambulance away from the hospital shed. Had they not done this, or not discovered the fire, the probability is the shed would have taken fire, and the patients, of whom there are four or five, would have been burned to death.

## A Sham Army Doctor.

A SURGEON in the Army Medical Service, having observed a newspaper paragraph stating that Henry Dudley, "army doctor," was recently sentenced to eighteen months' imprisonment for stealing £27 from the Adelphi Hotel, Liverpool, writes that there is no medical officer of the above name in the British Army.

A SUCCESSFUL attempt has just been made, says the *Student's Journal*, to transfuse milk into the circulation of a dying patient. The marvellous result that has followed this effort in a new direction will encourage the hopes of those who refuse to endorse the pessimism of certain leaders in medicine, and who decline to see any prosperous future for the introduction of novelties in this line. Although we have only meagre details as yet, it is not too much to anticipate that great triumphs may be achieved.

## Therapeutics of the Vienna School.

A VIENNA correspondent of the *Chicago Medical Journal* says that after listening to the lectures of Professor Bamberger, and hearing but little said of therapeutica measures, he asked a German physician why Prof. Bamberger did not say something about treatment? The reply was that physical diagnosis was his only *forte;* and that in all cases where there was any doubt he was most anxious not to lose sight of his patient, so that, in the event of death, he might be able to clear up the mystery by a *post-mortem* examination. On the other hand, Prof. Duchek is a more practical teacher of therapeutics, but he is careful not to give any medicine "that will materially disturb the functions of life," and restricts his list of remedies to about a dozen drugs. Of these the principal are quinine, digitalis, iodide and bromide of potassium, opiates, the salicylates, the acetate of ammonia, mineral acids, ipecacuanha, castor oil, the saline cathartics, and occasionally calomel. With regard to the above statement we may remark that the advancement of therapeutics will not be retarded by physicians making, like Prof. Bamberger, diagnosis their *forte*, provided there are others who are equally zealous in their almost exclusive attention to the subject of treatment. Prof. Duchek's plan of using very few drugs is a good one. It would be well if most medical men were to follow his example, and if the editors of the next edition of our Pharmacopœia were to weed that work of the many superfluous medicines and preparations which it contains.

## Albrecht von Græfe's Opinion of the Paris Clinics.

ALBERT VON GRÆFE (*Sein Leben und Sein Werken*) was not very flattering in his opinion of the Paris clinics. In those for internal medicine, he says, one spends his time without profit. The diagnosis is not so exact as in Prague. therapeutics not so rational as in Berlin, lectures verbose and uninstructive, students in excess, the examination of patients often impossible. The clinics of Bouillaud, Chomel, and Rostan are very little instructive, while Piorry is perfectly crazy. "I take most pleasure in following Louis, though he is always hoarse and does not speak a word. The chief thing in Paris is the devotion to specialties. I visit the clinics of Sichel and Desmarres regularly. At Sichel's the material is enormous, but his lectures are wordy, tedious, and more like the chatter of an old woman than of a man of science. At Desmarres' patients are less numerous, but his lectures are more interesting and his ideas and method of treatment more novel and instructive. In the Hospital of St. Louis there are from 400 to 600 skin patients; the treatment pursued is that of Biett, which is the most unscientific thing in medicine. Among all the French, Ricord is the most genial and original. At Trousseau's children's clinic you see a great variety of cases, and listen to rhetorical lectures filled with paradoxes. Trousseau, however, is the foremost physician for children living."

THE rates of mortality last week in the twenty-three principal cities and large towns of the United Kingdom were—Nottingham 20, Plymouth 20, Bristol 21, Ports-

mouth 21, Oldham 23, Bradford 23, Leeds 23, Birmingham 24, Norwich 24, Edinburgh 21, Brighton 25, Leicester 25, Wolverhampton 25, Newcastle-upon-Tyne 25, London 26, Sheffield 27, Glasgow 29, Hull 29, Liverpool 31, Sunderland 31, Salford 32, Manchester 34, the highest rate 43 per 1,000 in Dublin.

## Liebig's Extract of Meat.

When Baron Liebig stated that his discovery of extract of meat would prove one of the most beneficial to mankind of his various discoveries, he had no conception of the enormous extent of consumption which the future would develop. From a few hundred Bavarian oxen, which were originally sufficient to supply the continued demand, the total number of cattle since used by the Liebig Company, exceed 1,500,000 head.

In the principal foreign cities the rates of mortality, according to the most recent weekly official returns were in Calcutta 54, Madras 35; Paris 28; Geneva 26; Brussels 33; Amsterdam 24, Rotterdam, 30, The Hague 33; Copenhagen 24; Stockholm 22; Christiania 21; St. Petersburgh 47; Berlin 28, Hamburg 26, Dresden 23, Breslau 31, Munich 34; Vienna 28, Buda-Pesth 36; Turin 35; Alexandria 48; New York 23, Philadelphia 19 per 1,000 of the various populations.

The late Dr. Frederick Foster Quin, whose collection of works of art, &c., was sold the other day at Messrs. Christie, Manson, and Wood's, has left the bulk of his fortune, amounting to about £17,000, to the London Homœopathic Hospital, Great Ormond Street, of which he was the founder. Dr. Quin also bequeaths a legacy of £200, and his valuable medical library, to the Homœopathic Society.

Last week scarlet fever, measles, and whooping-cough showed fatal prevalence in Salford; and scarlet fever, whooping-cough, and enteric fever in Oldham. Scarlet fever also caused excessive mortality in Bradford, Sunderland, and Newcastle-upon-Tyne. In London 24 more fatal cases of small-pox were registered, and 19 in Dublin. A death from hydrophobia is also reported in London.

A complimentary dinner was given a few days since in London, by the committee and medical officers of the Volunteer Ambulance Department, to Surgeon-Major M'Nalty, who has volunteered for active service in Afghanistan. The chair was taken by Surgeon-General Munro, the president of the department.

A Bill bearing the names of Mr. Rodwell, Sir Baldwyn Leighton, and Mr. Bristowe, to provide for the establishment of county infirmaries for the reception and relief of the infirm poor chargeable to unions and parishes in England and Wales other than in the metropolis, and for other purposes relating thereto, has been printed.

Mrs. Fowler, wife of Dr. (?) Fowler, well known throughout the country as a phrenologist, and lecturer "On the Laws of Life and Health," died in London last week. She is said to have been the first lady professor of obstetrics in America.

A small, but not the less acceptable, testimonial was presented a few days since to Dr. Rees Hopkins, medical officer of the Pontypridd Union Infirmary, in the shape of a silver drinking cup, in token of the gratitude and esteem of his patients.

# Scotland.

Glasgow Medico-Chirurgical Society.—At the meeting of this Society held in the Faculty Hall, on Friday the 24th ult., Dr. A. D. Stewart read a paper "on the Percentage Representation of the Function of the Conductive Apparatus of the Ear." Dr. Stewart began by showing that the point to be decided in any examination of the conductive apparatus is the *minimum intensity* of sound required to excite vibrations at a fixed distance. If the intensity of sound were readily represented by figures, no better process than this could be desired, but as the intensity of sound is not readily expressed in figures, the distance, at which a sound such as that of a watch, possesses the minimum intensity required by the normal conductive apparatus, is taken as the representative of the intensity, and is regarded as the standard with which variations of distance—representing variations in the intensity of sound—may be compared, as watches are not uniform in intensity of the sound which they emit, and as uniformity in the results is desirable, Dr. Stewart proposes to assume a standard distance, 100 inches, to represent the minimum intensity necessary to excite vibrations in normal ears, and to correct watches by the method applied to scientific instruments when inaccurate. Thus, supposing a watch to have a normal distance of 56 inches, and that a patient hears it at 24 inches, the following proportional statement at once gives the percentage equivalent for the patient's distance—$56 : 24 :: 100 : x$; where $x = 42{\cdot}85$ per cent., which is the percentage equivalent for the conductive capability in his case.

Birth in the Street.—On the 24th ult., a young woman, named Jessie Miller, 24 years of age, residing in Richard Street, Glasgow, made application at the Maternity Hospital for admission, as she was about to be confined, but was told that the place being full she could not be admitted. That the place was full is, however, denied. She left to go home again, being accompanied by her step-father, and while passing up West Nile Street, she became ill, and gave birth to a female child on the street. Her step-father carried the infant home, where the poor woman was also assisted, and shortly after getting there she gave birth to a second child, a boy. Dr. Johnson, of the police, subsequently attended. It appears that there was neither food nor clothing in the house. The case has been reported to the parochial authorities; and the investigation will doubtless attract further attention to the alleged mismanagement of this institution.

The Maternity Hospital Scandal again.—At a meeting of the Barony Parochial Board held on the 28th ult., the case of Margaret McKendrick, who seems on the way to fame, once more turned up. Mr. F. G. Dougall asked if there was anything further in regard to the case, as it seemed to him "to be hanging up too long." The inspector said the Maternity Hospital had given him much trouble lately. In consequence of the action of the officials of that institution

(sic), he had nearly had two births in the board premises. One woman was refused admission into the hospital, who was in such a state that it took the parochial board officials all their time to get her into a bed in Barnhill. The institution required looking up. Mr. B. Martin said the Maternity Hospital seemed to be one of the blots of the city, and instanced a case that had come under his notice that morning of a girl residing in the East end, who in applying at the hospital at a quarter past eleven o'clock one evening, was refused admission. She managed to get back to the house which she left, and in which there was no bed, and within an hour she was delivered of a child. Was such a thing to be tolerated in a civilised country? Here is surely material for Mr. Donald Munro; and we are certain to hear something more of these matters in due course.

Royal Maternity Hospital, Edinburgh.—Dr. Angus McDonald has been appointed one of the ordinary physicians to this institution, in room of Dr. Zeigler, who, after ten years of service, has resigned.

Medical Education of Women.—At a meeting of the Committee for Securing the Medical Education of Women in Edinburgh, held at St. Andrew's Square, Edinburgh, on the 28th ult., it was unanimously resolved, on the motion of Professor Masson, to form a national association for promoting this object. The statement of accounts as submitted by Miss Louisa Stevenson, the Honorary Secretary, showed that during the past year the receipts had been £2,265, and the expenditure £2,110, leaving £155 in the hands of the treasurer.

Suing for Professional Attendance.—At a Small Debt Court, before Sheriff Balfour, held on the 29th ult., Dr. Alexander F. McKay, of Glasgow, sued John Raeside, 387 Duke Street, for the sum of £8 7s. 9d. for professional attendance and medicine, as per account commencing 15th Sept., 1877, and ending 3rd Jan., 1878. The patient was one of defender's work-women. He admitted liability for the first fortnight's attendance. Owing to contradictory evidence the Sheriff decided for £4 without expenses.

Glasgow Royal Infirmary.—The Annual General Meeting of the qualified contributors to the Glasgow Royal Infirmary was held on the 27th ult., in the Merchant's Hall. The Hon. the Lord Provost presided, and was supported by Mr. Wm. McEwen, Mr. John Burns, Rev. Mr. Matheson, Mr. Charles Nugent, Dean of Guild Playfair, &c. The report by Dr. Thomas showed the institution to be in a flourishing condition. The expenditure had been as follows:—House, viz., salaries and servants' wages, provisions, medicines, liquors, &c., £19,762 6s. 2d.; salaries (medical, secretary, cashier, and clerk, &c.) £2,652 4s. 11d.; repairs on house, &c., £439 11s. 5d.; total £22,854 2s. 6d.; extraordinary expenditure £704 13s. 2d., making the total expenditure of the house £23,558 15s. 8d., and leaving a balance of income over expenditure of £24,466 16s. 4d., which falls to be carried to the credit of the capital account.

Dr. McCall Anderson on Addison's Disease.—Dr. Anderson's paper, which was read before the Glasgow Medico-Chirurgical Society, entitled "A Case of Addison's Disease improving under Treatment, and on the Relationship between Addison's Disease, Vitiligo, and Alopecia Areata," has attracted some attention. This paper we propose giving to our readers in our next. It is very significant of the author's enviable facility for arriving at conclusions; and is perfectly on the same lines as his paper "On the Curability of Attacks of Puerperal Peritonitis and Acute Phthisis (Galloping Consumption)." We, in the North, are thus disposed to dispute with the metropolis the *cure* of consumption in its gravest forms. A very ingenious suggestion was made by Dr. Rinton as to the cure of Addison's disease. When he first saw the case, it occurred to him that the post-mortem would be interesting, and by way, evidently, of anticipating that pleasure, he saw Professor Cleland on the subject, and the question was discussed—"Why not remove the capsules?" (!) Dr. Brown-Sequard had removed both capsules from a rabbit, with a *result quickly fatal;* but in another case the animal *survived three days,* only *one capsule being removed.* (!) Dr. Anderson thought that Dr. Rinton's suggestion "in regard to operative interference, would be likely to be of service if the opinion is correct that the semi-lunar ganglia and solar plexus are involved in Addison's disease." Why not on limited grounds excise the semi-lunar ganglia and the solar plexus? Seriously, is such as this to be dignified by the term, "scientific discussion?"

# Correspondence.

## A MODIFICATION OF THE DUCKBILL SPECULUM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I wish to bring before the notice of the profession a modification of the usual form of Sim's Duckbill Speculum, as sold by the instrument makers. The blade is made much flatter and somewhat broader, and the part connecting the blade with the handle has a bevelled ring to admit the finger, which takes off some of the strain from the wrist, and gives greater facility for manipulation.

The advantage of the blade not being so deeply hollowed is, that when used while plugging the vagina, there is much less liability to catch in the plug and pull it out altogether, as frequently happens with the ordinary form of blade.

Anyone who has been obliged to hold one of the ordinary duckbill speculæ, or one with the straight handle (Simon's) during a sustained operation (sometimes lasting more than an hour) as in vesico-vaginal fistulæ, &c., will, I am sure, appreciate the cross handle, which is movable, being only fixed by a screw, can be carried separately, and when required, adapted to any sized blade, and which by bringing the "flexors" instead of the extensors of the arm into play, gives immense power of traction, and is not nearly so fatiguing as when the straight-handled modification, or the older-shaped duck-bill is used.

Messrs. Arnold & Co., Smithfield, are the makers in London, and John Whyte, Dublin.

Alexander Duke,
Assistant Physician, Rotundo Hospital.

## THE DUBLIN PUBLIC HEALTH JOB.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Some one having drawn my attention to a reference to me in your issue of the 29th ult., I beg to say the writer of the article has undertaken to supply some very inelegant parenthesis to my remarks in the Dublin Corporation, and at the same time, with much unfairness he omits what I really did say, and which justified me in using the severe words which conclude his quotation.

*The Medical Press* accused the Corporation of taking no

steps to close uninhabitable dwellings. I proved from documentary evidence that 700 dwellings had been closed, and about 800 withdrawn from habitation until certified fit for same. This was done in a period of ten years, and before we can put the Artizan's Dwellings Act into operation. *The Medical Press* again accused the Corporation for not stimulating vaccination.

In my remarks I said such was not within the powers of the Corporation. That there had been neglect, but that it lay with the Government and not with us, and I quoted the following extract from the last report of the Irish Medical Association :—"Your Council deeply regret that the vaccination laws at present in force in Ireland, which are admitted to be very imperfect, have not ere this been modified, and feel justified in expressing their opinion that the Government has been left without excuse for its inaction with regard to this important matter, and they feel bound to state further, that had either of the Bills suggested by the Association been made law much of the loss of life and other evils which are being daily caused by the present epidemic of small-pox would have been averted." Do I transcend the limits of politeness when I say the suppression of these points of my views becomes rather a "reptile press" than the columns of a fair English journal? As to myself, in my private capacity the improvement of the dwellings of the people has been my chief study. When High Sheriff of Limerick, I read a paper at the Royal Dublin Society. The immediate result was the formation of a company aided by Sir A. Guinness. Sir, the animus that inspires some people is apparent; they care more, I fear, for the death of popular institutions in Ireland than for the life of the people, but, thank God, they will have to destroy them first in your free country—a work beyond their power.

Uninfluenced by such very vulgar attacks we will pursue our course, and depend on the support of the disinterested and fair-minded men both in England and at home.

Trusting you will do me the favour of publishing this letter in you next issue, I have the honour, Sir, to be

Your obedient servant,

St. Michael's, Dalkey, Feb. 1st., 1879. CHARLES DAWSON.

## MILK TRANSFUSION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the *Irish Times* and *Freeman* of Thursday last, I noticed a statement, in a prominent position in both journals, that transfusion of milk had been performed the previous day by Drs. McDonnell and Meldon, for the first time in the United Kingdom. I am not aware by whose authority these paragraphs were inserted, but it appears very doubtful whether such announcements should be conveyed to the public or the profession through the medium of lay journals. My object in writing to you is to state that milk transfusion was performed in the County Louth Infirmary, on the 21st of April, 1878, on John Coleman, who was suffering from severe hæmorrhage (fatal), consequent on compound fractures of leg and thigh, involving the main vessels, by

Your obedient servant,

Dundalk, Jan. 26, 1879. HERCULES MACDONNELL.

# Obituary.

## THE LATE SURGEON-MAJOR E. J. GAYER,

Of the Indian Medical Service.

WE insert, with a regretful feeling of satisfaction that we are thus enabled to do justice to the memory of a distinguished officer, the following record of the career of the late Surgeon-Major E. Gayer, which we take from the *Indian Medical Gazette*. The editor of our contemporary, in his concluding remarks, says that he places this record in the hands of Dr. Gayer's boys, "that it may stimulate them to emulate the honourable and useful career of their father." We willingly comply with the request of Mr. Joliffe Tufnell, whose pupil Mr. Gayer was, to place the notice in our columns, in order that it may stimulate numbers of young men now studying for service in the army to emulate the honourable and useful career of Dr. Gayer, and, like him, at life's end to earn a similarly honourable notice :—

THE services of Surgeon-Major E. J. Gayer date from the 2nd of January, 1856. He had, therefore, on the 23rd of August, 1878, the date of his lamented death, completed a period of service of 22 years and nearly 8 months, in the employ, first, of the Honourable East India Company, and since 1858 of her Majesty the Queen. He obtained his commission as Assistant-Surgeon at the age of 22, the earliest age at which a medical officer could then be entertained, and died at the age of 44. The best years of a short life prematurely closed were thus spent in India; and it is the purpose of the following brief record to detail concisely in what manner they were spent. Soon after arrival in India, he was selected as physician to the Lieutenant-Governor, Sir F. Halliday, while on tour. His next appointment was to the civil station of Salone, in Oudh. He was serving at this station when the mutiny broke out. He found his way to Allahabad, which is 72 miles distant from Salone, but we have been unable to ascertain how he made his way to Allahabad. He left Allahabad and served with Colonel Barrow's Irregular Cavalry, composed of civilians and others whose occupation was gone in consequence of their districts being in a state of rebellion. He accompanied Havelock's force, and shared with it all the vicissitudes and dangers which culminated in the first relief of Lucknow on the 25th of September, 1857. He was present at no less than eleven actions during the mutiny, and was one of that glorious force which so intrepidly fought its way through the streets of Lucknow on the 25th of September. The brilliant deeds of Havelock and his followers have recently been recorded in glowing words, and it is not our intention to recount, in this biographical notice, events which have gained a conspicuous place in history. To have contributed as a unit to the magnificent exploit which Havelock finally accomplished after a series of fierce struggles, and the failure of a first attempt, is, however, a circumstance which invests with significance and glory the record of a single life.

Assistant-Surgeon Gayer was necessarily one of the garrison of the Lucknow Residency until the second relief by Sir Colin Campbell, which took place on the 16th of November, 1857. Subsequent to the relief of Lucknow he accompanied the relieving force on its return to Cawnpore, and was present at the defeat of the Gwalior rebels on the 7th of December, 1857. This event terminates the record of his war services, for which he obtained a medal and Lucknow clasp. He served for some time at Allahabad in the General Hospital, and obtained medical charge of the Allahabad Levy. While holding this charge, he was appointed to the civil station of Backergunge in Bengal, and was transferred thence to Tirhoot. Tirhoot used to constitute one of the most important and desirable civil medical appointments in Bengal. It was an immense district, containing a population of four millions. The climate is favourable to health, and indigo enterprise has attracted to the district a large European population. The head-quarters' station, Mozufferpore, is an important and populous one, and contains a good hospital-dispensary, which collects cases from a wide and populous area. Gayer laboured with great acceptation and success in this charge till February, 1871, when he took a well-earned furlough to Europe. He acquired a high reputation as a conscientious, industrious, and intelligent public servant, an excellent medical practitioner, and a first-rate surgeon. His services were eagerly sought by residents in the district, official and non-official, and greatly appreciated. To become a patient of Gayer's was to become a fast and lasting friend. He devoted special attention to surgery, and the Mozufferpore Dispensary presented annually a long list of important operations, and a good tale of success. He was particularly interested in diseases of the eye, and had a large practice in cases of cataract, for the removal of which he devised a special operation. He kept himself fully acquainted with surgical progress in Europe, and supplied himself with instruments and appliances which gave promise of improving surgical

practice. He was not fond of his pen, and beyond his official reports, which were always carefully drawn up, he placed no accounts of his observations, practice, and results on record. His leisure hours were employed in the study of chemistry, to which he was very partial; and in working with the microscope, to which as a student he had paid great attention. He was an enthusiastic and skilled microscopist, and was thoroughly familiar with the instrument theoretically and practically. He was equally successful in photography; and the attention which he devoted to astronomy is shown by the astronomical maps which he has left behind him.

During his furlough he was not idle. He attended the London and Paris hospitals, and laboured to master the improvements, more particularly in surgical instruments and practice, which had taken place since his student days. Two communications read before the Royal Microscopical Society on "A New Form of Micro-Spectroscope," show that his mind was occupied with the problem of increasing the usefulness and mechanical convenience of the microscope as a means of scientific investigation. A subsequent paper, entitled "Notes on Micro-Photography," gives evidence in the same direction. These communications indicate thorough familiarity with the mechanical and optical principles involved in the construction and use of the microscope, and ingenuity in devising means of improving it as an instrument of research. On his return from furlough, Gayer resumed his old appointment. Shortly after this, apprehensions of famine arose, and extensive relief measures were organised in Behar under the personal direction of Sir Richard Temple. The services of civil surgeons were put in requisition for this duty, and Surgeon-Major Gayer earned the Lieutenant-Governor's public acknowledgments for the assistance rendered on this occasion. Partly as a reward for these services, and partly in recognition of his merit as a man and surgeon, he obtained successively the Civil Surgeoncy of Dacca and of the 24-Pergunnahs, and was appointed to act as Professor of Surgery in the Medical College and First Surgeon in the hospital during the absence on leave of Professor Partridge. This was the summit of Gayer's ambition. During his incumbency in the College, Gayer threw his whole heart and energies into the work. He drew up a careful course of lectures on surgery, in which he dwelt with special minuteness on operations, instruments, and appliances. His clinical prelections were painstaking and laborious. He spared no trouble to give his students a good practical knowledge of surgery, and became very popular among them on account of his kind manner and constant efforts to instruct them. He personally superintended the execution of a series of diagrams to illustrate the teaching of surgery. These are admirably done, and supply a great want in the school. They will long remain a monument of Gayer's zeal and industry. During this time he became much appreciated and sought after in private practice, and commanded the confidence, respect—nay, affection—of a large and growing constituency. His success as a practical surgeon is indicated in the series of papers which we published in our issues for March, April, and May last, which give earnest of sound work and earnest endeavour to attain the great ends of a surgeon's thought and effort—the saving of life, limb, and function.

Gayer was a gentleman in every sense of the term, of a manly, honourable nature, with a high estimate of duty, and great energy and self-reliance in acting up to it. He was a man of kindly disposition, hospitable, of pleasant address and manner, warm-hearted and constant. He made many staunch friends, and those who became his friends remained so. He was free from tinsel and display, and, though by no means self-depreciative, disdained to use artifices to advance his interests. He was rather late of attaining the object of his ambition—a chair of surgery—but there is very little doubt that, had he lived to fill it long, he would have proved a worthy successor of the able men who had preceded him. The end of his life is a very sad one, for the sadness of it consists in its abrupt and untimely extinction, when he was in the fulness of mental vigour, and prepared, with everything in his favour, to embrace opportunities of usefulness and success in life and practice. With this exception, the tale is a bright one—a tale of good service, a record of a cheery, earnest, practical nature, actively engaged in the god-like task of relieving suffering and prolonging life.

He has left behind him seven sons. We place this record, brief and imperfect though it is, in the hands of his boys. It may, perhaps, stimulate them to emulate the honourable and useful career of their father—a career characterised throughout by a sound and manly devotion to duty, and spent from beginning to end in the service of his country, and in actively promoting the welfare of his fellow-men. An example of this sort is a heritage of high value, far surpassing, if rightly appreciated and used, the most splendid material fortune.

# Medical News.

**Royal College of Physicians of London.**—The following gentlemen having passed the required examination, were admitted Members on January 30:—

Blake, Henry, M.B. Lond., St. George's Hospital, S.W.
Carrington, R. E., M.B. Lond., 13 Loughborough Road.
Hood, Donald W. C., M.B. Camb., 43 Green Street, W.
Khory, Rustomjee Naserwanjee, M.D. Brussels, 47 Minford Gardens, West Kensington Park, W.
Kidd, Percy, M.B. Oxford, St. Bartholomew's Hospital.

**Royal College of Surgeons of England.**—The following gentlemen, having passed the required examination for the diploma, were admitted Members of the College at a meeting of the Court of Examiners on the Jan. 23rd:—

| | |
|---|---|
| Davies, E. E. C. C. | Payne, C. Alexander |
| Elliot, Henry C. | Smith, H. A., L.R.C.P. Ed. |
| Forsbrook, W. H. R. | Waldo, F. Joseph |
| Lory, W. John | Weston, S. T. Darby |
| Mason, W. Harrup | Wharry, A. James |
| Nicod, L. C. Napoleon | Young, C. Louis |

The following gentlemen passed on Jan. 24th:—

| | |
|---|---|
| Collier, M. P. Mayo, L.S.A. | Morrison, J. T. Jackman |
| Freeman, W. Thomas | Preston, A. Chevallier |
| Griffiths, H. Tyrrell | Vores, Arthur |
| Hall, J. Lees, L.S.A. | White, R. Watts |
| Layton, H. Albert | |

The following gentlemen passed on Jan. 27th:—

| | |
|---|---|
| Congreve, G. Thos., L.S.A. | Leatham, H. B., L.S.A. |
| Fuller, T. Warberton | Miller, H. Percy |
| Giles, F. William | Ogle, C. John, L.S.A. |
| Greathead, J. B. S. | Price, E. Morris |
| Jenkins, J. H., L.R.C.P. Ed | |

**Liverpool Medical Institution.**—The following gentlemen have been elected office-bearers for the ensuing year:—President: Dr. Waters. Vice-presidents: Mr. Manifold, Dr. Oxley, Mr. Puzey, and Mr. Newton. Treasurer: Dr. Dickinson. Hon. Secs.: Dr. Caton and Mr. Edgar Browne. Council: Drs. Davidson, D. Williams, W. Williams, Howie, and Graham; Messrs. Warburton and Bernard.

# Novelties.

## ROBSON'S INHALER.

The profession and the public have reason to thank Messrs. Allen & Son, for the various useful and cheap contrivances they have introduced from time to time. Their Turkish Bath for home use is a model in these respects. Now we have before us a very handy Inhaler, the effectiveness of which is insured by a simple inner contrivance, which causes the air or medicated vapour to be inhaled to pass through the water before it can possibly reach the mouth; thorough medication being thus obtained without trouble or annoyance to the patient. The accom-

panying illustration represents the inhaler with the inner diffusing apparatus lifted out.

## AN IMPROVED BRONCHITIS KETTLE.

We have also received two specimens of Bronchitis Kettles, to which we have much pleasure in calling the attention of our readers. Their uses we need scarcely mention. Each has a receptacle under the elbow for the purposes of medication if required. The water is put in at a screw plug on one side. The boilers are seamless as regards tops and bottoms, being stamped in one piece, which is then seamed. The lamp is also in one piece. Messrs. Allen & Sons are also now manufacturing a Food Warmer, the saucepan and kettle and lamp of which are made seamless in one piece. Seamless tinware has been made by many large firms in Birmingham, Wolverhampton, &c., for upwards of 25 years. It has not, however, gained the markets for *home* uses to the same extent as in the colonies, notwithstanding the fact that such ware is much more durable and much less likely to get out of order.

## THE INVALID'S KETTLE.

The same firm also introduce to the notice of the medical profession, a new article, called "The Invalid's Kettle," which should speedily recommend itself for general usefulness. It is not intended to supersede the regular bronchitis and croup kettles before referred to.

This novelty, divested of its tube, is to all intents and purposes, and can be used as—a strong and well made ordinary kettle.

By a simple construction of the spout, a long tube, of about twenty-four inches is provided, which can be slipped into the spout, and the article is at once converted into a vapourising or bronchitis kettle, ready for any emergency.

We believe this is the first attempt at the conversion of an ordinary kettle into an effective vapouriser, and the manufacturer has succeeded in producing a strong, cheap, and effective article.

## SUDDEN DEATH OF DR. JOHN BARKER, CURATOR OF THE MUSEUM OF THE IRISH COLLEGE OF SURGEONS.

We regret to record the death of John Barker, M.D., T.C.D., Curator of the Museum and Examiner in Materia Medica in the Royal College of Surgeons in Ireland. Dr. Barker retired to rest on Saturday night to all appearance perfectly well, and was found dead in bed on Sunday morning. It is supposed that the cause of death was heart disease, but the question will be the subject of a coroner's inquest. Dr. Barker was a sound anatomist, and had considerable mechanical talent in the preparation and exhibition of the specimens used in a museum. Under the Committee of Privy Council, Dr. Barker was a frequent lecturer in provincial towns, while that method of instruction was patronised by Government, and his lectures were in much demand by local bodies and used to be well attended. The deceased obtained a gold medal in mathematics in T.C.D. in 1840. The Curatorship of the College of Surgeons, now vacant, is worth £150 a year (Dr. Barker's salary was latterly £200), and no doubt there will be many applicants for the post. An Examinership in the professional court is also vacated by Dr. Barker's death.

## THE DUBLIN BRANCH OF THE BRITISH MEDICAL ASSOCIATION

Held its second annual meeting last week, with a success which must have been gratifying to its President, Mr. Porter, and its Hon. Secretary, Dr. Duffey. The Association assembled for business in the Hall at the College of Physicians of Ireland, and was there addressed by Mr. Porter in an intelligent and interesting discourse. Dr. Gordon was selected for the Presidency of the year 1879, and arrangements for the coming meeting of the Association at Cork were brought under discussion by Dr. H. MacNaughton Jones.

The banquet of the branch which followed upon the meeting was successful in all respects. The Legislature was represented by the Attorney-General for Ireland and Dr. Cameron, M.P., the Bar by Mr. Purcell, Q.C., the University by Dr. Haughton, and the Profession by the President of the College of Surgeons and Vice-President of the College of Physicians.

The Dublin branch undoubtedly owes the greater part of its success to the energy and popularity of Dr. Duffey, and the proceedings last week must have been gratifying to him for the trouble he has taken in the matter.

## NOTICES TO CORRESPONDENTS.

### NEW SUBSCRIBERS FOR 1879.

Our best thanks are due to the following gentlemen who have kindly tendered us their support as "New Subscribers" in addition to the 150 names published by us a fortnight since :—

Dr. Bates, Cowbridge, Glamorgan.
Dr. Borck, St. Louis, America.
Dr. Cashin, Jervis Street Hospital, Dublin.
Dr. Christal, Collon.
Dr. Dalgleish, Aberdeen.
Dr. Edmonds, Croydon, Surrey.
Dr. Fixott, St. Heliers, Jersey.
Dr. Hughes, Kilcock.
Dr. Kisch, Liverpool.
Dr. Mather, Haddington, N.B.
Dr. O'Connell, Plumstead, Kent.
Dr. O'Grady, Stockport, Cheshire.
Dr. Percival, Boston.
Dr. Pietri, Comptroller of the Marine Hospital, Toulon, France.
Dr. Prichard, Abington Abbey, Northampton.
Dr. Ritchie, Gateside, Forfar, N.B.
Dr. Saintfield, Philadelphia.
Dr. Shanahan, Adare.
Dr. Vallin, Hôpital St. Michel, Paris.
Dr. Wheeler, New York.
Dr. Williams, London.

Dr. L. S. Forbes Winslow.—"The Psychology of Hamlet" essay received, but, unfortunately, too long for our present crowded columns. If you will reduce its length it shall appear under our "Department of Lunacy" next week.

Harveian Society of London.—On Thursday, Feb. 6, at 8.30 p.m., Mr. Teevan, "On Incontinence and Retention of Urine in Children."—Dr. Norman Kerr, "The Mortality from Intemperate Drinking, and how best to arrive at the truth."

Mr. Walter Rivington, F.R.C.S., will deliver the Hunterian Oration in the Theatre of the Hunterian Institution on Wednesday next at 8 p.m.

Prof. Humphry, F.R.S., of Cambridge, will deliver the Annual Hunterian Oration at the Royal College of Surgeons, England, on Friday, the 14th inst., at 3 o'clock.

Dr. Patterson Cassells.—We shall be glad to receive your translation of the thesis "On Exostosis," though in the present crowded state of our columns, we fear we shall be unable to give space to it before March.

## MRS. WELDON.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—I have received so many letters inquiring the name of the weekly journal you mentioned in your issue of Jan. 29, as printing my history, I shall be obliged to you to inform my inquirers in your columns that the *London Figaro* publishes the same in its Wednesday number. Your obedient servant,

Tavistock House, Tavistock Square, GEORGINA WELDON.
February 3, 1879.

DR. ——, Glasgow.—The omitted notes will appear next week in the column devoted to "Literary Notes and Gossip."

DR. TAYLOR.—The remaining "Clinical Lectures on Diseases of the Lungs," by Prof. Charcot, are in type awaiting illustrations from the engraver, which we hope to receive in time for our next. Many thanks for your complimentary note.

PROF. PARKER will commence a Course of Nine Lectures "On the Evolution of the Vertebra" at the London College of Surgeons on Monday next, at 4 p.m.

OBSTETRICAL SOCIETY OF LONDON.—This (Wednesday) evening, at 8 o'clock, Specimens will be exhibited by Dr. Hicks Botham, Dr. Galabin, and Dr. John Williams.—The President's Address.—Paper: Dr. Jas. Braithwaite, "On Digital Dilatation of the Os Uteri in Labour."

EPIDEMIOLOGICAL SOCIETY.—This (Wednesday) evening, at 8.30, Sir Joseph Fayrer, "On the Relation of Filaria Sanguinis Hominis to Endemic Disease in India."

THE meeting of the Pharmaceutical Society of Great Britain will be held this (Wednesday) evening at 8 o'clock, when the following paper will be read:—"On Myrtus Cheken," by Mr. E. M. Holmes.

ODONTOLOGICAL SOCIETY.—First meeting of the Session, 1879, on Monday, Feb. 10, at 8 p.m. Inaugural Address by the President, Mr. Edwin Saunders, F.R.C.S.—Casual Communications, the President, Mr. H. Moon, and Mr. S. I. Hutchinson.

THE Medical Society of the King and Queen's College of Physicians of Ireland will meet on Wednesday next, at 8 p.m., at the College Hall, when the following communications are set down for reading: Dr. Walter Smith, "Illustrations of the Use of Chrysophanic Acid in Diseases of the Skin."—Dr. W. J. Smyly, "On Hystero-Epilepsy."

## A CASE FOR SYMPATHY.

THE following subscriptions have been received in response to the appeals in the MEDICAL PRESS AND CIRCULAR and the *Lancet*:—

| | £ | s. | d. | | £ | s. | d. |
|---|---|---|---|---|---|---|---|
| C. Aspray, Esq. .. .. | 25 | 0 | 0 | Miss Aspray .. .. | 5 | 0 | 0 |
| Mrs. Spicer .. .. | 21 | 0 | 0 | Sir J. Paget, Bart. .. | 3 | 3 | 0 |
| Sir Wm. Jenner, Bart. .. | 5 | 5 | 0 | Dr. Wakley .. .. | 2 | 2 | 0 |
| G. W. Hind, Esq. .. | 5 | 5 | 0 | Dr. Watson .. .. | 2 | 2 | 0 |
| W. H. George, Esq. .. | 5 | 5 | 0 | H. Barton, Esq. .. .. | 1 | 1 | 0 |
| F. B. Courtenay, Esq. .. | 5 | 5 | 0 | W. Burton, Esq. .. .. | 1 | 1 | 0 |
| Dr. Quain.. .. .. | 5 | 0 | 0 | Dr. Duncan .. .. | 0 | 10 | 0 |

Any further Donations will be thankfully received by—
Messrs. Coutts & Co., Bankers, Strand, London.
W. Haward, M.R.C.S., &c., 33 Marina.
F. B. Courtenay, M.R.C.S., 2 Chandos St., Cavendish Sq., London.
G. W. Hind, F.R.C.S., 22 Gower Street, Bedford Square, London.

MR. A. C.—In our next.

MR. G. W. W.—Received, and shall be examined.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Quain, London. Dr. Pietri, Comptroller of Marine Hospital, Toulon. Mr. Cotterell, University College. Dr. Johnson, Dublin. Mr. Marlett Boddy, Dartford. Mr. Teevan, London. Dr. Russell, London. Dr. Thorowgood, London. Mr. Rathbone, M.P., Liverpool. Dr. Lombe Atthill, Dublin. Dr. Charteris, Glasgow. Dr. Johnson, London. Mr. J. Rooke Ley, Manchester. Mr. Reginald Harrison, Liverpool. Dr. Brinton, Philadelphia. Mr. Douglas Hemming, Bournemouth, Dr. Bourneville, Paris. Dr. Saunders, London. Dr. Black, Glasgow. Mr. Hall, Wragley. Mr. Edmonds, Croydon. Mr. Hyslop, Stretton. Dr. Mather, Haddington. Dr. Herbert Major, Wakefield. Dr. Percival, London. Dr. Kelly, Rotherhithe. Mr. Squire, London. Mr. Dalgleish, Aberdeen. Mr. Atkinson, Kendal. Dr. Dutant, Paris. Surgeon-Major Duncan, Woolwich. Dr. Fixott, St. Helier's, Jersey. Dr. Edgar Sheppard, Colney Hatch. Dr. Hardy, Paris. Dr. Birch, London. Mr. Hilton, Edinburgh Mr. Whistler, Glasgow. Mr. Hoblyn, Bath. Dr. Winslow, London. Dr. Borck, St. Louis, America. Dr. Williams, Colchester. Mr. Klugh. National Dental Hospital. Dr. Bates, Cowbridge, Glamorgan. Dr. Mullaby, Templemore. Dr. Phillips, Novan. Dr. McDonnell, Dublin. Dr. Purdon, Kinnetord. Dr. Hempbill, Clonmel. Dr. Walker, Ronmahon. Dr. Burnside, Clondalkin. Dr. Wall, Carrick-on-Suir. Dr. Walsh, Dublin. Dr. Brown, Waterford. Dr. Callan, Castlebellingham. Dr. Brown, Belfast. Dr. Douglas, Warrenpoint. Dr. McIlroy, Ballymoney. Dr. Clarendon, Newcastle. Dr. Ringland, Lisbane. Dr. Andrew, Chapelizod. Dr. Baker, Dublin. Dr. Cronin, Drogheda. Dr. Newill, Dungannon. Dr. Davison, Dromara. Dr. Smith, Clogher. Dr. Heyns, Ballyvaughan. Dr. Martin, Newry. The Registrar-General for England. The Registrar-General for Ireland. The Registrar, Royal College of Physicians of London. Mr. Dawson, Dalke. Dr. Prichard, Northampton. Dr. Ritchie, Gateside, Forfar. Dr. Headlam Greenhow, London. Dr. E. Ward, New York. Dr. O'Grady, Stockport. Mr. Hay, Hull. Mr. Schacht, Clifton. Mr. Jesse, Macclesfied. The Registrar of the Medical Council. Dr. Althaus, London. Mr. Haynes Walton, London. Mrs. Baines, London. Mr. Rackham, Norwich. Dr. Leared, London. Dr. O'Flannagan, Houghton-le-Spring. Dr. John Williams, London. Dr. Black, Cockburnspath. Mr. Francis Vacher, Birkenhead. Mr. Lawson Tait, Birmingham. Dr. O'Connell, Plumstead. Dr. Patterson Cassells, Glasgow.

## VACANCIES.

Armagh Union, Richhill Dispensary.—Medical Officer. Salary, £120, with fees, and £20 as Sanitary Officer. Election, Feb. 10.

Cork Street Fever Hospital, Dublin.—Temporary Physician. Election, Feb. 6.

Dental Hospital of London.—Lectureship on Dental Surgery. Applications to the Hon. Sec. at the Hospital, Leicester Square, before Feb. 12.

Inverness District Asylum.—Assistant Medical Officer. Salary, £80, with board. Applications to Dr. Aitken before Feb. 8.

Manchester, Hulme Dispensary.—House Surgeon. Salary, £130. Applications to the Hon. Sec. before Feb. 10.

Richmond (Surrey) Infirmary.—House Surgeon Salary commencing at £80, with board. Applications to the Secretary before the 15th prox.

Roscommon County Infirmary.—Apothecary and Registrar. Salary, £60, with apartments and allowances. Election, Feb. 17.

St. Pancras, Middlesex.—District Medical Officer. Salary, £110, with the usual extra fees. Applications to the Clerk at the Union Offices before Feb. 10.

Stourbridge Dispensary.—House Surgeon. Salary, £130, with £25 allowance for horse hire. Applications to the Hon. Sec. before Feb. 8.

West Bromwich Hospital.—House Surgeon. Salary, £30, with board. Immediate application to the Hon. Sec., 13 Church Road, Edgbaston, Birmingham.

## APPOINTMENTS.

CARDEW, G. A., M.R.C.S.E., Resident Medical Officer to the Cheltenham General Hospital.

CHRISTAL, J., L.K.Q.C.P.I., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Collon, co. Louth.

CONNOLLY, William, L.R.C.S.I., &c., Medical Officer, Waterford Union Workhouse.

CONRY, John, L.R.C.S.I, &c., Medical Officer Kilkelly Dispensary, Swinford Union.

DOYLE, C. W., M.B., C.M., Assistant-Surgeon Accoucheur to the Norwich Lying-in Charity.

FITZGERALD, E. L.R.C.P. Ed, L.R.C.S.I., Medical Officer to the Mallow Union Workhouse, co. Cork.

GUNN, J., M.B., C.M., Medical Officer for the West Dispensary District of the Royal Infirmary, Dundee.

HARDING, R., L.R.C.P. Ed., Medical Officer for the New Radnor District of the Kington Union, Herefordshire.

HUGHES, R. L., L.K.Q.C.P.I., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Kilcock, co. Kildare.

HUTCHINSON, T. S., L.R.C.P. Ed., M.R.C.S.E., an Honorary Surgeon to St. Bartholomew's Hospital, Chatham.

MACDONALD, A., M.D., F.R.C.P. Ed., a Physician to the Royal Maternity Hospital, Edinburgh.

MACDONNELL, M. A., M.D., C.M., Medical Officer and Public Vaccinator for the No. 1 District of the Toxteth Park Township.

ROBERTS, G. W., L.R.C.P. Ed., Medical Officer of Health for the Denbigh Urban Sanitary District.

RODGER, W., L.F.P.S.G., Medical Officer and Public Vaccinator for the Parish of Galston, Ayrshire.

SANCTUARY, T., M.B., L.R.C.P.Ed., Medical Officer for the Western District of the Redruth Union, Cornwall.

SHANAHAN, J. F., L.K.Q.C.P.I., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Adare and Kilfinny, co. Limerick.

THOROLD, E. F., M.L., Physician to the Plymouth Dispensary.

WALKER, J. F., L.K.Q.C.P.I., Medical Officer for the No. 6 District of the Basingstoke Union, and Medical Officer of Health for the No. 6 Sub-district of the Basingstoke Rural Sanitary District.

WALSH, J. J., L.R.C.P.Ed. & L.M., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Ardfinane Dispensary District of the Clogheen Union.

WARREN, S., M.B., C.M., Medical Officer for the Upton District of the Wirrall Union, Cheshire.

## Births.

BURKE.—Jan. 15, at Kaltimagh, co. Mayo, the wife of Michael J. Burke, M.D., of a daughter.

CORDNER.—Jan. 25, at Aughnacloy, co. Tyrone, the wife of Louis Maxwell Cordner, L.K.Q.C.P.I., of a daughter.

M'CAY.—Jan. 19, at Clough, co. Antrim, the wife of John M'Cay, L.R.C.P., &c., of a daughter.

MILLER.—Jan. 20, at Derry, the wife of Sir William Miller, Knt., M.B., T.C.D., of a son.

WALKER.—Jan. 25, at Putney, the wife of Alexander Walker, M.D., of a son.

## Deaths.

DUKE.—Jan. 30, at the Glen, Lewisham, Fannie Louisa, wife of J. C Duke, M.R.C.S.

HADLEY.—Jan. 24, at Colmore House, Handsworth, John Joseph Hadley, M.R.C.S.E., aged 71.

LANGLEY.—Jan 24, at Park Street, Worksop, William David Langley, M.D., aged 76.

MILLER.—Jan. 27, at Elm Grove, Ealing, London, W., Surgeon-Major John Miller, M.D., late Staff Surgeon to H.E. the Governor of Madras, aged 51 years.

MALAN.—Jan. 23, at Montreux, Switzerland, Henry Victor Malan, M.D., aged 62.

RITCHIE.—Found dead on the 15th ult., on a public road at Billinglay (apparently from exposure), George Ritchie, M.D., aged 72.

SHUTE.—Jan. 27, at Lutton Place, Edinburgh, Robert Shute, Esq., M.R.C.S., aged 85.

THOMPSON.—Jan. 12, at Hull, John Thompson, M.D., aged 42.

WHITAKER.—Jan. 14, at Springwell House, Blackburn, Edmund F. Whitaker, L.R.C.P. Ed., aged 45.

WILKIN.—Jan. 26, at San Remo, Italy, Isabella, wife of H. C. Wilkin, M.D., of Kensington.

# IRISH POOR-LAW INTELLIGENCE.

## ALLEGED FRAUD ON AN INSURANCE COMPANY.

IMPORTANT TO REGISTRARS.

At the Clonlara (Limerick) Petty Sessions on Friday, before Messrs. Robert Hunt, J. L. Brown, Wm. Steel Studdert, and Patrick Frost, Michael Shanahan and Michael Keogh were prosecuted for—"That you did wilfully make statements to the District Registrar at Clonlara, respecting one John Lynch, deceased, and thereby did knowingly cause a false entry to be inserted in the register of deaths, and did wilfully obtain a certified copy of such false entry from the District Registrar, and did, afterwards offer the same to the Prudential Assurance Company, knowing the same entry to be false, with intent, thereby, feloniously to defraud."

Dr. William M'Donnell, District Registrar, deposed that Shanahan, Keogh, and a man named Quilligan, came to him to register the death of one John Lynch, and also to procure a certified copy of the registry, in order to obtain the amount of a policy of insurance on the life of the deceased, which had been secured in the interest of Quilligan. In reply to questions put to them by witness on that occasion, Keogh and Shanahan distinctly stated that the age of John Lynch, the deceased, was 56 years. Witness made the entry accordingly and granted the certificate.

Patrick Lynch, son of the deceased, said, that to the best of his belief, his father was 80 years of age. Witness was aware that his father's life was insured. Keogh did not ask him to come to Dr. M'Donnell to have the death registered. Witness was himself 52 years of age.

Alfred Marshall, one of the company's officers, deposed that when a certified copy of the death of John Lynch had been presented, the company sent their agent, Shanahan, one of the accused, the amount of the policy, £12, and requested him to have it given to the widow of Lynch. If the true age of deceased, 80 years, had been registered, it would be to the disadvantage of the parties concerned.

A farmer, named Patrick Keane, deposed that the signature of Patrick Keane in the document referred to was not in his handwriting. He did not authorise his name to be attached to the paper.

Charles Flynn, district superintendent of the company's agents, deposed that he was acquainted with the handwriting of Shanahan, and he believed on his oath that the two signatures were both in the same handwriting—that of Shanahan himself.

The magistrates, after some deliberation, unanimously granted the informations.

## ATHY UNION.

AN EXPENSIVE PATIENT.

An application was before the Board from a woman lately an inmate in the small-pox hospital, for the price of a gold ring alleged to have been destroyed during the process of disinfection.

Mr. Dunne—Is this the woman who sent in the bill for £12 for clothes destroyed?

Clerk—Yes, the same.

Mr. Dunne—Is she a married woman?

Master—She is not.

Mr. Dunne—I do not know what an unmarried servant woman wants with gold rings; neither can I understand how it could be destroyed during the process of disinfection.

Dr. O'Neill—That woman must have cost the union at least £40.

Mr. O'Beirne—How on earth was that, doctor?

Dr. O'Neill—From the nature of the dietary she was on.

The Master—She must have consumed several gallons of whisky.

Dr. O'Neill—I had one patient who was consuming eighteen eggs and a quart of whisky every day for several days.

The further consideration of the subject was deferred.

THE PETTY SESSIONS—FEES ON VACCINATION AND SANITARY PROSECUTIONS.

On last board day a bill for stamps used on summonses in cases of defaulters under the Vaccination Act, and also for sanitary summonses, was before the meeting. In the case of the latter, the sub-sanitary officer informed the guardians the clerk of court was not entitled to the fees, as the summonses were of no use, as they were illegally filled.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

41 & 42 Vic., Cap. 52.

(8th August, 1878.)

An Act to consolidate and amend the Acts relating to Public Health in Ireland.

Be it enacted, &c.

PRELIMINARY.

1. *Short Title.*
2. *Interpretation of Terms.*

PART I.

SANITARY AUTHORITIES.

3. (*Verb.*) *Urban and Rural Sanitary Districts.*—For the purposes of this Act Ireland shall be divided into sanitary districts to be called respectively—

(1) Urban sanitary districts; and

(2) Rural sanitary districts;

And every such urban and rural sanitary district shall respectively be subject to the jurisdiction of a sanitary authority, in this Act called an urban sanitary authority or urban authority and a rural sanitary authority or rural authority invested with the powers in this Act mentioned.

4. (*Verb.*) *Description of Urban Sanitary Districts and*

*Urban Sanitary Authorities.*—Urban sanitary districts (or urban districts) shall consist of the places in that behalf mentioned in the first column of the table in this section contained, and urban sanitary authorities (or urban authorities) shall be the several bodies of persons specified in the second column of the said table in relation to the said places respectively.

TABLE above referred to.

| Urban Sanitary District. | Urban Sanitary Authority. |
|---|---|
| The City of Dublin - - - | The Right Honourable the Lord Mayor, Aldermen, and Burgesses acting by the Town Council. |
| Towns corporate (except Dublin) - | The Mayor, Aldermen, and Burgesses acting by the Town Council. |
| Towns, the population of which according to the last Parliamentary census exceeds six thousand, having Commissioners appointed by virtue of an Act made in the ninth year of the reign of George the Fourth, intituled, "An Act "to make provision for the lighting, cleansing, and watching of "cities and towns corporate and "market towns in Ireland in "certain cases." | The Commissioners. |
| Towns, the population of which according to the last Parliamentary census exceeds six thousand, having Municipal Commissioners under 3 & 4 Vict., c. 108. | The Municipal Commissioners. |
| Towns, the population of which according to the last Parliamentary census exceeds six thousand, having Town Commissioners under the Towns Improvement (Ireland) Act, 1854 (17 & 18 Vict., c. 103). | The Town Commissioners. |
| Towns or townships having Commissioners under Local Acts. | The Town or Township Commissioners. |

5. (*Verb.*) *Power to Appoint Committee.*—Every urban authority may from time to time appoint out of their own number so many persons as they may think fit for any purposes of this Act which, in the opinion of such authority, would be better regulated and managed by means of a committee or committees: Provided that a committee so appointed shall in no case be authorised to borrow any money, to make any rate, or to enter into any contract, and shall be subject to any regulations and restrictions which may be imposed by the authority that formed it.

6. *Rural Sanitary Districts.*—The area of every poor-law union, with the exception of those portions (if any) of the area which are included in urban sanitary districts, shall form a rural sanitary district, and the guardians of the union shall, as such, be the rural sanitary authority of such district, subject to the following conditions:—

(1) No elective guardian of any electoral division belonging to such union and forming or being wholly included within an urban sanitary district shall act or vote in any case in which guardians of such union act or vote in their capacity of members of the rural sanitary authority.

(2) (*Abs.*) Where part of an electoral division belonging to a union is situated in an urban sanitary district, the Local Government Board may divide such electoral division into separate wards and determine the number of guardians to be elected by such wards.

(3) (*Verb.*) An ex-officio guardian resident in any electoral division belonging to such union which is situated in an urban sanitary district shall not act or vote in any case in which guardians of such union act or vote in their capacity of members of the rural sanitary authority unless he is the owner or occupier of property situated in the rural sanitary district of a value sufficient to qualify him as an elective guardian for the union.

7. (*Abs.*) *Power to Alter Sanitary Districts.*—The Local Government Board shall have power, by provisional order, to separate from a rural sanitary district any town or district wholly situate therein, in which there shall be town or township commissioners under any Act of Parliament, whether the number of the inhabitants of such town or district shall be more or less than six thousand, and to constitute it an urban sanitary district; and the said board shall likewise have power, by provisional order, to add any town or township under this Act constituted an urban sanitary authority to the rural sanitary district in which it is situate, to be subject thereafter to all provisions of this Act affecting rural sanitary districts. No such provisional order shall be made except on petition from one or other of the towns, townships, or districts affected by such order, nor in the event of any objection being taken by any person affected thereby until after due local inquiry.

8 (*Abs.*) *Powers and Duties of Urban Authorities.*—Every urban authority shall within their district (to the exclusion of any other authority) have, exercise, and be subject to all the powers, rights, duties, capacities, liabilities, and obligations exerciseable by or attaching to an urban authority all the powers, &c., exerciseable or attaching by and to the local authority under the Bakehouse Regulation Act and the Artizans and Labaurers Dwelling Act, or any Acts amending the same.

Also the Baths and Washhouses Acts and the Labouring Classes Lodging Houses Acts.

9. *Similar Powers and Duties of Rural Authorities.*

10. *Vesting of Property in Sanitary Authorities.*

11. (*Verb.*) *Sanitary Officers and Superintendent Officers of Health.*—Every medical officer of a dispensary district shall be a sanitary officer for such district, or for such part thereof as he shall personally be in charge of, under the title of medical officer of health, with such additional salary as the sanitary authority thereof may determine, with the approval of the Local Government Board; and every sanitary authority, whether urban or rural, shall appoint such other sanitary officers, including a medical superintendent officer of health when deemed necessary, as the Local Government Board shall in each case direct, with such salaries or additional salaries as the said sanitary authority shall determine, with the approval of the Local Government Board; and the said board shall assign to the medical officers of health, and to the other sanitary officers, if any, and to the medical superintendent officer of health, if such an officer be appointed for the sanitary district, their respective duties and functions in the discovery, or inspection, or removal of nuisances, in the supply of pure water, in the making or repairing of sewers and drains, or in generally aiding the administration of the sanitary laws within the district.

Provided that, with regard to salaries or additional salaries, whereof any portion is to be recouped to any local fund from moneys voted by Parliament, the amount of any new salary and the proportion between any existing salary, and the addition thereto, shall be approved by the Commissioners of Her Majesty's Treasury.

Every such salary or additional salary so determined or approved shall be payable from such local fund as the Local Government Board shall indicate as properly chargeable therewith, and such part thereof as Parliament shall from time to time determine shall be recouped to such local fund out of the moneys to be voted by Parliament; and the Local Government Board shall have the same powers with regard to the qualification, appointment, duties, regulation of salary, and tenure of office of every sanitary officer as they have in the case of the medical officer of a dispensary district.

12. (*Verb.*) *Formation of United District.*—Where it appears to the Local Government Board, on the application of the sanitary authorities of any sanitary districts, or of any of such authorities, and after due inquiry, that it would be for the advantage of such sanitary districts, or of any of them, or of any parts thereof, or of any contributory places in any rural sanitary district or districts, that they should be formed into a united district for all or any of the purposes following, that is to say—

(1) The procuring a common supply of water; or

(2) The making a main sewer, or carrying into effect a system of sewerage for the use of all such districts or contributory places; or

(3) For any purposes of this Act,

the Local Government Board may, by provisional order, form such districts or contributory places into a united district.

13. (*Abs.*) *Governing Body of United District.* — The governing body of a united district shall be a joint board consisting of such ex-officio members and of such number of elective members, not being less than the ex-officio members, as the Local Government Board may, by the provisional order forming the district, determine.

A joint body shall be a body corporate, &c.

14. *Regulation as to Constitution of Joint Board.*

## PART II.

### Sanitary Provisions.

*Sewerage and Drainage—Regulations as to Sewers and Drains.*

15. (*Abs.*) *Sewers vested in Sanitary Authority.*—All existing and future sewers within the district of a sanitary authority, except—

(1) Sewers made by any person for his own profit, or by any company for the profit of the shareholders; and

(2) Sewers made under any local or private Act of Parliament, or for the purpose of irrigating land,

shall vest in and be under the control of such sanitary authority.

16. *Power to purchase Sewers.*

17. (*Verb.*) *Maintenance of Sewers.* — Every sanitary authority shall keep in repair all sewers belonging to them, and shall cause to be made such sewers as may be necessary for effectually draining their district for the purposes of this Act.

19. (*Verb.*) *Powers for making Sewers.*—Any sanitary authority may carry any sewer through, across, or under any road, or any street or place laid out as or intended for a street, or under any cellar or vault which may be under the pavement or carriageway of any street, and after giving reasonable notice in writing to the owner or occupier, into, through, or under any lands whatsoever within their district.

They may also (subject to the provisions of this Act relating to sewage works without the district of the sanitary authority) exercise all or any of the powers given by this section without their district for the purpose of outfall or distribution of sewage.

19. (*Verb.*) *Sewage to be Purified before being Discharged into Streams.*—Nothing in this Act shall authorise any sanitary authority to make or use any sewer, drain, or outfall for the purpose of conveying sewage or filthy water into any natural stream or watercourse, or into any canal, pond, or lake, until such sewage or filthy water is freed from all excrementtitious or other foul or noxious matter such as would affect or deteriorate the purity and quality of the water in such stream or watercourse, or in such canal, pond, or lake.

20. *Alteration and Discontinuance of Sewers.*

21. (*Verb.*) *Cleansing Sewers.* — Every urban sanitary authority shall cause the sewers belonging to them to be constructed, covered, ventilated, and kept so as not to be a nuisance or injurious to health, and to be properly cleansed and emptied.

22. (*Abs.*) *Map of System of Sewerage.*—Every urban sanitary authority shall, and any rural sanitary authority may, if they think fit, provide a map exhibiting the system of sewerage which shall at all reasonable times be open to the inspection of the ratepayers of their district.

23. *Power of Owners and Occupiers within District to drain into Sewers of Sanitary Authority.*

24. (*Abs.*) *Use of Sewers by Owners and Occupiers without District.*—The owner or occupier of any premises without the district of a sanitary authority may cause any sewer or drain from such premises to communicate with any sewer of the sanitary authority on such terms and conditions as may be agreed on between such owner or occupier and such sanitary authority.

25. (*Verb.*) *Power of Sanitary Authority to Enforce Drainage of Undrained Houses.*—Where any house within the district of a sanitary authority is without a drain sufficient for effectual drainage, the sanitary authority may by written notice require the owner or occupier of such house, within a reasonable time therein specified, to make a covered drain or drains emptying into any sewer which the sanitary authority are entitled to use, and which is not more than one hundred feet from the site of such house; but if no such means of drainage are within that distance, then emptying into such covered cesspool or other place not being under any house as the sanitary authority direct; and the sanitary authority may require any such drain or drains, cesspool or cesspools, to be of such materials and size, and to be so ventilated, and to be laid at such level, and with such fall as may appear to them to be necessary: Provided that where, in the opinion of the sanitary authority, greater expense would be incurred in the construction of such cesspool or cesspools than in the making of a drain emptying into a sewer which they are entitled to use, the sanitary authority may require the owner or occupier to make such drain, notwithstanding that the sewer into which it is to empty is not within one hundred feet of the site of the house.

If such notice is not complied with, the sanitary authority may, after the expiration of the time specified in the notice, do the work required, and may recover in a summary manner the expenses incurred by them in so doing from the owner, or may by order declare the same to be private improvement expenses.

Provided that where, in the opinion of the sanitary authority, greater expense would be incurred in causing the drains of two or more houses to empty into an existing sewer pursuant to this section, than in constructing a new sewer and causing such drains to empty therein, the sanitary authority may construct such new sewer, and require the owners or occupiers of such houses to cause their drains to empty therein, and may apportion as they deem just, the expenses of the construction of such sewer among the owners of the several houses, and recover in a summary manner the sums apportioned from such owners, or may by order declare the same to be private improvement expenses.

(*To be continued.*)

## CARLOW UNION.

### FEVER ACCOMMODATION.

At a late meeting of the Carlow Board of Guardians a letter was read from the Local Government Board, expressing surprise that the Guardians had as yet taken no action on the recommendation contained in the last report of the inspector, Mr. O'Brien, that sheds for the reception of patients suffering from small-pox or other infectious disease should be erected in the enclosure of the fever hospital, and that the present sheds in Graigue, which had completely gone out of repair, should be taken down and utilised as far as possible.

## CAVAN UNION.

### THE STRADONE DISPENSARY.

The Chairman read the following letter from Dr. Lyndon, Ballinagh :—

"Ballinagh, 20th January. 1879.

"As the subject relative to the remuneration which I am to receive as 'Dispensary substitute' for performing the duties of the Stradone Dispensary district is to be under your consideration on Tuesday, I respectfully beg to state for the information of members of the Board not conversant with the facts of the case, that my appointment was made at a time in the year whence sickness is most prevalent—that I have attended the dispensary twice a week, never getting home till a late hour in the evening—and that I have been obliged as well to attend on a large number of visiting tickets—in most instances having to go upwards of thirteen or fourteen miles from my own residence. Under the above circumstances I think I am justified in asking the Board to look upon the case as a very exceptional one, and trust you may see youe way to give me the reasonable sum of three guineas per week.

"I remain, your obedient servant,

"George Lyndon."

The Chairman—I suppose the Board will not alter its decision come to of not paying more than £2 a week.

Mr. Smith—I read the letter of Dr. Lyndon's in the *Celt*, and I quite concur with his statement that posting costs him nearly £2 a week. You will have to pay a doctor £5 a week if you bring him from Dublin.

Mr. Martin—I would be for allowing the doctor the £3 3s. a week owing to the inclemency of the weather and the hardship of travelling at present.

Mr. M'Givney—The proper thing to do is to pay Dr. Lyndon what Dr. Mathews is getting, and anything over that let Dr. Mathews pay him.

Mr. B. Gaffney—You sanctioned the payment of £3 3s. to Dr. Mathews when he was acting in Ballinagh, and if you give it in one case why not give it in this.

Mr. M'Givney—This is not a time for increasing heavy taxation on people. I think all officials should be reduced in their salaries, because the produce of the land was now at half the price it was five years ago.

Mr. Moore—How did the accident occur to Dr. Mathews?

Mr. Thompson—The accident occurred in the discharge of his private practice, but not in discharging the dispensary duties.

Mr. Moore—If that be so he ought to pay his substitute.

The Chairman—The question is whether you will give Dr. Lyndon £3 3s. a week or not.

Mr. H. Faris said the Board never decided that the substitute was to be paid. He did not object to pay Dr. Lyndon £20, but let Dr. Mathews pay him. It had been decided there over and over again that if a doctor took sick or happened with an accident in the hunting field, if he wanted a substitute to discharge his duties he should pay him. That order was never overruled yet, and he therefore moved that Dr. Mathews pay his substitute.

Mr. H. Nesbitt—What rule did the dispensary committee of Stradone make? We should not become dictatorial to the committee.

The Chairman said the committee agreed to pay the substitute for a month, and supposing that Dr. Mathews declined to pay his substitute, and the substitute declined to act, were the people to be left without a doctor? The Board could not permit that, neither would the Local Government Board sanction it.

Mr. Thompson said if the medical officer of that institution met with an accident in the discharge of his duties, it would be only fair to pay his substitute, and it was the rule of the Board to do so; but if a medical officer contracts an illness in his private practice, it would be most unjust that the ratepayers should pay double, that is, for two doctors—the officer and the substitute.

The Chairman—I will now read for you Dr. Mathews' letter:—

"January 19, 1879.

"Gentlemen,—I beg to enclose a certificate from Dr. Mease, who has attended me since my accident. I am more anxious than the members of your Board to resume my duties as medical officer of my dispensary. As I gave the proper notice at the time to the secretary of my dispensary committee according to the L. G. B. (22) article of rules and regulations of dispensaries, I am of opinion I have done my duty in the matter, and it rests with you to have the sick poor of the district looked after during my incapacity from illness or other cause.—I am respectfully,

"James Mathews, M.D."

Mr. Knipe—Is it known where Dr. Mathews was coming from when he received this accident?

Mr. M'Cann—He was coming from Belturbet after attending a sick call.

Mr. Knipe—That was private practice.

Mr. M'Cann said he looked on the accident as a natural illness. The substitute of the latter was paid by the Board for three months. Dr. O'Reilly was also a long time sick, and his substitute was paid by the guardians. Under the circumstances they would not be doing wrong in paying Dr. Mathews's substitute until he resumed his duties.

Mr. James Duignan sain at the time the substitutes were paid by the Board the doctors were receiving £75 a year salary; afterwards the Local Government Board added £25 a year more to their income. At that time everything was high, and it was very difficult to get either male or female servants. However, the Board came to the conclusion that as they were paying £25 additional to the doctors that each one of them should pay his own substitute in the event of his not being able to discharge his duties. A great change has taken place since that time, because now they could get servants if they only gave them proper food and shelter.

The Chairman said he would put the motion that Dr. Mathews pay his substitute.

Mr. M'Cann moved an amendment to the effect that Dr. Lyndon be paid by the Board up to the present date at the same rate as that paid to Dr. Mathews.

The Chairman declared the amendment carried by a majority of one.

The result is that Dr. Mathews' substitute will be paid by the Board for his services for six weeks.

It may be as well—again—to remind Poor Law Medical Officers that for a substitute to act for the medical officer is irregular until he has had a definite appointment from the responsible officer of the Dispensary Committee, and that he has no claim whatever for remuneration except on definite arrangement on the subject with that officer. He should distinctly understand that by so doing he acquires no claim—moral or legal—upon the medical officer. He should remember also that if he omits to obtain, at the hands of the Committee, or its responsible officer, a definite appointment and a definite understanding as to payment, he in undertaking the duties does so at his own risk, inasmuch as it is the regulation that the guardians "shall, subject to the approval of the Local Government Board, determine the amount of remuneration (*if any*) to be paid" to the temporary substitutes, and it is therefore quite open to the guardians to refuse to pay anything for such services.

As regards the continuance of the salary of the Dispensary medical officer during his illness, the Council desire to point out that the dispensary medical officer who complies strictly with the terms of the regulations as above referred to, is entitled, *as a matter of right*, to receive his salary during the continuance of his illness, and it is not within the power of the guardians to refuse payment, or to make any deduction from the amount, either for remuneration of the *locum tenens*, or for any other purpose.

It is not within the authority of a Board of Guardians, by any resolution made at the time or previously, to alter the provisions of the regulations, or to create a rule having such effect; and in case of their refusal to pay the *locum tenens*, the dispensary medical officer is not bound in honour or in law to make good such payment, unless he has previously entered into an implied or expressed understanding with the *locum tenens* to that effect, which he is in no way called upon to do.

ON

## CHEMICAL INJURY TO THE SURFACE OF THE EYE WITH QUICKLIME—DESTRUCTION OF THE EYE.

By Mr. HAYNES WALTON, F.R.C.S.,

Surgeon to St. Mary's Hospital, and Surgeon in Charge of the Ophthalmic Department of the same.

Gentlemen,—The effect of lime on the eye depends on the caustic property of the lime, whether it be quick lime, or reduced by any of the combinations with which it is made into mortar. I have often drawn your attention to the action of mortar, which varies much in its composition as used by different builders. Weak mortar, although freely applied to the surface of the eye, may produce no more effect than slightly whitening the conjunctiva, and giving cloudiness to the cornea, from which there may be complete recovery. A stronger compound will have a greater effect with a more or less permanent result on the cornea. When very strong mortar, lime, or, worst of all, unslaked lime, enters the eye, the conjunctiva, in its whole thickness is entirely and rapidly acted on, and so is the epithelium on the cornea, and the true cornea, and the worst effects ensue.

There is an insidiousness about the course of these cases that deceives. An inexperienced observer cannot be aware that the slighter damages, which would merely indicate that the cornea has not escaped scatheless, may seriously impair its transparency, or even affect its vitality. Nor can he have any idea of the distressing results that are to ensue when the conjunctiva has been severely acted on. The whitening and the swelling which occur, with absence of pain, are not threatening symptoms, and even the separation of the decomposed part gives little or no indication of the bad effects that must follow. It is only when cicatrisation is rather far advanced that the inevitable contraction becomes apparent. Inevitable, I say; for wherever there is destruction of the conjunctiva from this cause, or indeed from any escharotic, there must follow a corresponding amount of contraction and of adhesion of the eyelids to each other, or of one or both, to the eyeball.

This boy, æt. 13, whom you have seen many times, was admitted under these circumstances: A workman spitefully threw a handful of quicklime at his face, some of which entered his left eye. Two hours afterwards he was brought to the hospital. Already his eyelids were swollen and spasmodically closed, and tears were flowing freely. The surface of the eye was exposed, by retracting the eyelids with instruments, and well washed, whereby the lime was removed. The next day I saw this unfortunate patient. Already the cornea had perished, for it was shrivelled and opaque. The conjunctiva was much chemosed. There was severe pain in the ocular region, with headache and feverishness. Here was evidently a severe case before me, for the eye was destroyed. I ordered frequent fomentations, combined with opiates, and rest in bed. Relief ensued: a muco-purulent discharge issued; the inflammatory symptoms lessened, and in a fortnight the remains of the eyeball could be well examined. The *débris* of the cornea had separated, and the iris was covered with red granulations.

Some of you asked me whether I should not extirpate the eyeball. I said no; but instead I would endeavour to save a large stump, or as much of the eyeball as I could, because of the advantages to the patient as contrasted with an empty orbit. Let me explain a little. If an eyeball be extirpated before the adult period, the orbit never attains its full development, nor, therefore, the face its symmetry. An artificial eye is a more perfect appliance in proportion to the size of the reduced eye on which it rests; and it never sits well where there is no stump. Even when an artificial eye is not worn there is less inconvenience and less deformity with a

stump than without one, for there is less collection of extraneous matters, the eyelids do not turn in, and the tears are better carried away into the nasal chamber. In the course which I have adopted, there is an essential detail to be mentioned. I have extracted the crystalline lens through an incision across the iris. A lens in a disorganised eye is apt to get cretaceous, or osseous, and all the more likely the older the patient, and so act as a foreign body, especially if it should become loose. Quick healing has followed. I have only to consider the immediate treatment of lime in the eye. Washing with water should be resorted to as quickly as possible. When a syringe is not at hand, the patient should be laid on his back, the eyelids held well open, and water poured into the eye from a tea-kettle, or anything which has a spout or nozzle. Should nothing of this kind be available, water should be taken into the mouth and spirted by a fine jet into the eye. After diligent washing, the entire conjunctiva should be searched to discover any adherent bits, and any such should be picked off. The sinuses of the eyelids should be well inspected. Water being a very poor solvent for lime, it has been imagined that here there is a great scope for practical chemistry; but in reality nothing will serve our purpose so quickly and so efficiently as water; and it is an agent which inflicts no damage to the eye. But if you wish to know what has been said about chemical agents, and how far they have been employed as scientific playthings, as well as to amuse or humbug patients, I beg to refer you to page 463 of my practical work on "Diseases of the Eye." The contractions which result from destruction of the conjunctiva I will consider in my next clinical remarks.

## CASES OF OVARIOTOMY; WITH REMARKS. (a)

By LOMBE ATTHILL, M.D.,
Master of the Rotunda Hospitals, Dublin.

HAVING made it a rule, ever since I commenced to operate, to publish the particulars of every case of ovariotomy which occurred in my practice, whether successful or unsuccessful, I now lay before this Society the details of the following four; they comprise one unsuccessful and three successful cases.

CASE I.—J. C., æt. 28, unmarried, was admitted into the Rotunda Auxiliary Hospital on 1st August, 1878. She was anæmic, pale, thin, and walked with difficulty in consequence of an enormous tumour which filled the whole of the abdomen.

She stated that a tumour, the size of an orange, was first detected when she was only ten years old, and that it had since then gradually increased till it had attained its present size; the growth, however, had been much more rapid during the last year.

She also stated that she had never menstruated, nor had she experienced much pain, of late however, in consequence apparently of the great size and weight of the tumour, she suffered considerable distress, and had become incapable of supporting herself, as she had hitherto done, by teaching.

On examining the abdomen, it was found that the tumour reached from the ensiform cartilage to the pubes, and dipped into the pelvis; it was very solid, but fluctuation apparently existed over a considerable portion of it. The uterus, which was of normal size, was quite free. After a careful examination, I arrived at the conclusion that the tumour was an ovarian multilocular cyst, a large portion of it being solid.

The great size of the tumour, its solidity, and the weakly state of the patient, made me most unwilling to operate; on the other hand, she had the prospect of being reduced to actual want from her inability any longer to fulfill the duties of a governess; her health had, moreover, of late failed so rapidly, that it was most improbable she could long survive in her present condition. I told herself and her friends that I was adverse to the operation, but that if she urged it I considered it my duty to give her the chance it afforded. My friend, Dr. Kidd, who saw the case with me, coincided in this view.

The patient herself wished for the operation; her friends opposed it, but she firmly refused to be guided by their wishes, and begged of me to operate, saying that life in her present state was unbearable. So I consented.

On the 1st August, the patient having been etherised, I proceeded to expose the tumour; this was effected without difficulty, and Well's trocar plunged into it, but not one drop of fluid escaping, it was withdrawn, when it was discovered that the trocar was plugged with a quantity of soft putty-like matter, with which the cyst was filled. As it was evident its contents could not be evacuated in the ordinary manner, I enlarged the opening into the tumour, when a quantity of semi-fluid matter, of the consistence and colour of cream, slowly flowed out; but this soon ceased, and I had to dig out the contents of the cyst, plunging my hand into the putty-like mass, and scooping it out. In doing this, I found that the tumour was divided by a firm septum into two divisions. This septum was only broken down with difficulty, being very firm, and in some parts consisted, of bony material so hard and sharp as to tear my hand. In addition to the putty-like substance, the cyst also contained a quantity of hair, and deep down my hand came in contact with hard irregular masses, firmly adherent to the walls of the cyst, and apparently smaller cysts, the walls of which were partially ossified.

The tumour being now considerably lessened in size, I determined to endeavour to turn it out of the abdomen without completely emptying it, which indeed appeared almost impossible to effect. The incision in the integument was accordingly enlarged upwards, and I commenced to break down the adhesions, which were universal and very vascular. This was effected partly with the hand, partly with the handle of the knife, it occupied a long time, and there was a good deal of hæmorrhage; but at last it was completed, though more than once I thought the patient would have died before it could be done, so great was the collapse. No pedicle could be discovered, or any trace of ovary.

The hæmorrhage having ceased, and the abdomen thoroughly cleansed, the wound, which reached from an inch below the ensiform cartilage to the pubes, was closed, and the patient removed to bed in a state of extreme collapse, being very cold and pulseless. Warm jars were placed at each side of the body and at the feet. Ether was injected hypodermically with benefit, and brandy and beef tea thrown up the rectum. The operation lasted an hour and forty minutes. An hour after, that is at 1 p.m., the pulse had returned to the wrist, but was very feeble, and the body had become warm.

At 2 p.m. she was bathed in perspiration. Pulse, 140; Temp. 101 deg. She spoke feebly and complained of pain in the abdomen. She was very restless, throwing her arms about and moving her legs much. Small quantities of beef-tea and brandy had been given at intervals, one-third of a grain of morphia was now injected under the skin, and she fell into a restless sleep, during which the pulse varied much every few minutes, both in strength and frequency. At 3.30, the pulse being very feeble, some brandy was administered, and as she complained of distress in the region of the bladder, the catheter was passed, but only a few drops of urine escaped. Within ten minutes after this she turned deadly pale, broke out into a cold clammy sweat, the pulse became imperceptible, and in a moment or two she was dead.

The immediate cause of death appears to have been collapse, due probably to the trifling shock caused by passing the catheter, for I remarked at the time that though it

(a) Read before the Surgical Society of Ireland. The discussion will be found on page 00.

slipped in with the greatest ease, a tremor ran through her frame as it entered the bladder.

I have given the details of this case *in extenso*, because, so far as I am aware, no similar one has been recorded. Not only was it difficult in the extreme, but anything so irksome as the endeavouring to empty this enormous cyst by digging out with the hand sits soft putty-like contents, has seldom been experienced in any surgical operation.

Annexed is a report of the appearance, structure, and contents of the tumour, made by one of the resident pupils.

*Examination of Ovarian Cyst removed from the Abdomen. By Dr. Atthill*

*Examination, August, 8th.*

*Exterior.*—The tumour, which weighed 38 lbs., consisted of a large round multilocular cyst; its covering had the appearance of fibrous tissue, here and there cartilaginous, and almost bony. The remnants of vascular fibrous adhesions were found attached principally to its posterior part. No appearance of a pedicle could be found.

*Interior.*—On section, the mother cyst contained within it two daughter cysts, separated from the former by a wall of fibro-cartilaginous and bony tissues, so dense as to require the use of the saw. The mother cyst contained a purulent substance, very like cream in appearance and consistence, without any odour; also a thick cheesy material at its base, intermingled with tufts of hair. In the daughter cysts were found a number of small grape-like cysts, containing a gelatinous and calcareous material. The inner surface of the wall of the tumour is partly smooth and pale, and partly cretaceous. Here are found small fine hairs springing from the surface.

*Chemical.*—The contents are almost entirely dissolved by ether and chloroform, separately, especially by the former. A very small quantity of albumen and epithelial cells were found.

*Microscope.*—The smooth inner lining of tumour consisted of layers of pavement epithelium; the wall was composed of white fibrous tissue intermingled with yellow elastic tissue; cartilage cells were found in other parts of the wall of the cyst. When the addition of chloroform and ether had dissolved the fatty matter under the microscope, a small number of round granular epithelial cells were left behind.

Case II.—H. S. W., æt. 22, unmarried, admitted into the Rotunda Auxiliary Hospital, 26th August, 1877, being the subject of a large ovarian tumour, the existence of which had been previously diagnosed. It evidently consisted mainly of one large cyst, fluctuation in which was very distinct, but in the left inguinal region a solid portion about the size of a small cocoa-nut could also be detected. This young lady, though never robust, had enjoyed good health till six months previously, when her strength began to fail, and menstruation became irregular. Soon after she perceived that her clothes had become too tight, but till she consulted me neithershe nor her friends had any idea that she was the subject of a serious disease. As the tumour was rapidly increasing in size and health failing, I advised an immediate operation. This was performed on the 27th August, 1878.

Ether, as in all my recent operations, was the anæsthetic employed, administered by means of Ormsby's inhaler; the tumour was easily exposed, and the contents of the larger cyst easily evacuated, without the escape of any of its contents into the abdomen. There were not any adhesions, and the tumour was turned out with facility; it proved to be attached to the left ovary. The pedicle, about 2 inches in length, was first secured with a clamp, then ligatured with two hemp ligatures, both of which were passed through its substance and tied so as to form a figure of 8. The pedicle was then divided behind the clamp and thrown into the pelvis, and the incision in the abdominal wall closed with five carbolised catgut ligatures. The abdomen was covered with a layer of salicylic cotton, support being given in the usual way by straps of adhesive plaster and a flannel roller. The cyst was bi-locular; the larger one contained twelve pints of fluid. The smaller was dermoid; it contained a thick caseous matter and a large quantity of fine light-coloured hair, but no fluid.

I shall not weary the Society with the details of this patient's case subsequent to the operation, but shall merely mention a few particulars. Twenty-four hours after the operation the temperature was 102°, but ran up during the day to 103·8°. There was a troublesome cough which caused much distress, but this was allayed by an opiate. She slept well, and the temperature fell to 100°. There was some sickness off and on, and as there was much tympany, I directed on the morning of the third day a turpentine enema to be administered, but as she objected to this, a purgative pill containing calomel and aloes was in my absence very injudiciously substituted. This purged her violently and griped much. The vomiting also returned; the temperature, however, did not rise, it remained at about 100°.

For several days subsequently her condition remained most unsatisfactory, the vomiting and diarrhœa could not be checked, and her state became very critical.

Turpentine stupes, blisters, poultices externally, morphia hypodermically, opium by the mouth, and various other means were tried without effect; finally, on the recommendation of my friend, Dr. James Little, she was restricted to a teaspoonful of extract of chicken, (*a*) given every half hour, nothing else except a little ice being allowed. The extract was prepared by digesting the flesh of a chicken, carefully freed from all bone, skin, or fat, in a covered vessel, about a wineglassful of cold water only being added. This when strained produced about two wineglassfuls of fluid. A teaspoonful of this every half hour was the sole nourishment allowed for nearly 24 hours. It was always retained, and at the expiration of that time the troublesome symptoms had disappeared, and from that date she made a rapid recovery.

Case III.—M. L., æt. 30, a servant, the subject of a multilocular ovarian cyst, was admitted into the Rotunda Auxiliary Hospital in May, 1878. The tumour caused her but little discomfort, except that arising from its size, which at this time was not large. Her general health, too, was good, except in this one respect, that she had not menstruated from more than a year.

She was unable to give any information as to the early stages of the growth of the tumour, it having attained its present size when first observed by her some eight months previously. The tumour then being of comparatively small size, its growth apparently slow, and the patient's health good, I advised that the operation be deferred. She accordingly returned home to the country, but in three months time sought to be readmitted, stating that she now suffered much pain, and had become much larger. This, on examination, being found to be the case I proceeded on the 17th September, 1878, to operate.

The tumour was exposed without difficulty, and tapped with Spencer Wells' trocar, but only a small quantity of fluid escaped, this evidently being due to the fact that the tumour was multilocular I endeavoured to tap the adjacent cysts through the one first punctured without withdrawing the trocar, but this method not succeeding, I had the tumour steadily drawn forward while I introduced the fingers of my left hand into the cyst, and guiding the knife in them, laid open in succession eight or ten cysts of various sizes, none of them containing more than a pint of fluid. The tumour being thus much reduced in size, was without difficulty turned out of the abdomen. There were no adhesions.

The pedicle was about two inches long. It was first clamped, then ligatured, as in the previous case, divided, seared with the actual cautery, and returned into the abdomen. This patient recovered without a bad symptom.

On examining the tumour subsequently, it was found to consist of a mass of cysts, 15 or 16 being of considerable size, and a very large number of small ones, obviously their contents could not have been evacuated by means of a

(*a*) Dr. Little informs me that this method of preparing and administering essence of chicken was suggested to him by Dr. Haddon, of Rathmines.

trocar. The method I adopted was the only one possible under the circumstances. Doubtless it was impossible to prevent the escape of a considerable quantity of fluid into the abdomen, but this was subsequently carefully removed by sponging, and, as the result proved, was in no way injurious.

Case IV.—Miss ——, æt. 30, consulted my friend, Dr. Little, early in September last. She complained of debility, and stated that she suffered from indigestion; and as in Case II., neither she or her friends were aware of the existence of any serious ailment. Dr. Little observing the size of the abdomen, examined her with care, and detecting the existence of a large ovarian tumour, recommended her to place herself under my care.

There being no doubt as to the nature of the case, and of its being one eminently fit for operation, I advised ovariotomy being performed; to this the patient at once consented, only stipulating that there should not be any delay. Accordingly, assisted by Mr. Porter and Mr. Croly, I performed ovariotomy on the 18th September; ether being administered by Dr. Wm. Smyly. The operation occupied but twenty-five minutes. No difficulty whatever was experienced; the patient made a rapid recovery, and was able to drive out in three weeks. The tumour consisted of one large and a small secondary cyst. In this case, also, the pedicle was ligatured, as in the former cases, and "pocketted." With respect to the first of these cases, I had grave doubts as to the advisability of performing the operation; doubts which the unfortunate results fully justified; and I only undertook it reluctantly at the earnest wish of the patient. As to the other three, no second opinion could exist as to the necessity of operating.

In all my cases some slight preparatory treatment was practised. One or two doses of some aperient, castor oil being the best, was administered previously; one dose is not sufficient. I had much trouble in a former case from the non-observance of this rule; fæcal accumulation setting up much irritation seven or eight days after the operation. Next, no solid food was given for 24 hours previously, but beef-tea, milk, egg, and light farinacious food were allowed. After the operation, ice alone was at first given; subsequently, beef-tea, and milk, and soda water. Mr. Keith writes to me that he finds patients "do better without food till flatus passes freely." He generally "begins with tea or thin gruel and milk, or milk and water." As to stimulants, I am of opinion that as a rule, the less given the better. Of course, if collapse occurs, or the patient be very feeble, they must be given with a free hand.

Vomiting is, as all are aware, probably the most troublesome symptom we have to deal with; in many cases ice fails to check it; morphia hypodermically injected, sometimes stops it temporarily—altogether, occasionally. I have resolved, on the next occasion to try the effect of hot water, swallowed at as high a temperature as it is possible to get the patient to take it. This has proved very successful in vomiting occurring in other cases. Next, as to the treatment of the pedicle: in the first case here recorded, there was no pedicle to ligature; in the other three I ligatured it, and returned it into abdomen. In each case the pedicle was transfixed with two needles, armed with hemp ligatures, inserted so that when the ligatures were tied they overlapped each other, and formed a figure of ∞. The pedicle was then severed, and its end seared with the thermo-cautery. Formerly, I used the clamp, which method doubtless affords the most perfect security against hæmorrhage; but it has many drawbacks; the chief ones being the fœtid discharge which so commonly occurs, and the length of time which elapses before the wound in the abdomen heals. But what chiefly induced me to abandon the use of the clamp was this—that in one of my operations, on the removal of the clamp after the lapse of the usual time, I found the end to be in a very unhealthy condition; quite decomposed, and giving origin to a very fœtid discharge. I pared away with a scissors all the unhealthy tissue I could reach, and washed the part carefully with carbolic lotion; but on dressing the wound the following day, I found that the stump had sunk quite out of sight. It appeared to me that the adhesions which I had supposed united it to the abdominal wall had given way, and I felt some alarm lest septicæmia should supervene. The patient did well; but since then I have ligatured and pocketted the pedicle, and I certainly prefer this method.

In none of these four cases was the carbolic spray used, but that this was so was due to accident. I think the operation should, if possible, be done under the spray; but though the spray was not used, I took every other antiseptic precaution in my power; not only washing my own hands in carbolic solution, and seeing that my assistants did the same, but also washing every article used—sponges, knives, and especially forceps—in it also; and I believe these precautions to be of the utmost importance.

I think the result of the cases I have here detailed are very encouraging. Ovariotomy in Dublin has not as yet attained that success which it has in London and Edinburgh, but I firmly believe we shall soon attain as good results. Mr. Keith tells me that they had fifteen deaths in Edinburgh when it was first practised there, and points out that ovariotomy seems to have an unfortunate beginning in almost every place.

I believe our stage of misfortune is nearly ended; still I doubt if Irish women of the lower ranks will ever be as favourable cases for this operation as are English and Scotch women. They bear the operation well enough, but their temperament is too excitable. They are, too, very difficult to manage subsequently, and I find it very hard to induce them to maintain that absolute quietude which is so essential to success in this operation. I certainly lost two patients from this cause: one was doing very well till the third day, when some discomfort being caused by tympany, she made the most violent and continuous efforts to "belch up wind" as she said, but the result was she swallowed large quantities of air, and thus increased her discomfort. She turned, too, from side to side, and even sat up in bed. She would not take ice, tore off the ice cap which was applied to her head when the temperature rose; then she screamed and threw herself about when we wished to give a hypodermic injection, and finally forced her fingers down her throat to induce vomiting. Could such a patient possibly recover?

Of the four patients whose cases I have now related, one was a private patient, two were governesses, the fourth, though a servant, was a very quiet, intelligent woman; and I believe the fact of their being of this superior class materially influenced the favourable results which I have had on the present occasion to record.

## NOTES ON OVARIOTOMY. (a)

By WILLIAM STOKES, F.R.C.S.,

Professor of Surgery in the Royal College of Surgeons, and Surgeon to the Richmond Hospital, Dublin.

In the following remarks I shall studiously avoid entering into any minute details connected with the last four ovariotomies I have performed, as my object on the present occasion is mainly to elicit the opinions of those who have had experience of the operation, as to a few salient points connected with the procedure, about which the opinions of surgeons are still somewhat unsettled.

Case I.—A married woman, who never had children, æt. 62, and who had never previously been tapped, was admitted into the Richmond Surgical Hospital under my care in June, 1874, suffering from a large multilocular ovarian cyst. Eighteen months previously she noticed the growth first. It had increased very rapidly of late. At the umbilicus the measurement was forty-two inches, and from sternum to pubis, twenty-two and-a-half inches. The catamenia for some time had been scanty and

(a) Read before the Surgical Society of Ireland.

irregular. Notwithstanding the existence of some ascitic fluid, the diagnosis of a multilocular ovarian cyst could be made without much difficulty, and this was verified at the time of the operation. The patient was cheerful, her appetite good, her pulse steady and regular, and although she suffered much from the size and weight of the tumour, she was otherwise in fairly good health. On June 27, I performed ovariotomy, and removed a large multilocular cyst. There was much difference in the size of these cysts, some being extremely small, the size of small grapes, while others were as large, and larger, than a cocoa-nut. The contents, too, varied much in appearance and consistence. There were some adhesions at the upper and back part of the tumour, which, however, were easily broken down. The pedicle, a fairly long one, was secured by Spencer Wells' clamp. The wound having been closed and dressed in the usual way, the patient was removed to bed. She rallied well after the operation, but next day there was a morbid increase in the rapidity and feebleness of the pulse, the temperature also low, and these unfavourable symptoms did not subside, but continued to increase. On the evening of the second day the patient sank apparently from exhaustion, for there were no post-mortem evidences found to account satisfactorily for the unfavourable result.

Case II.—An unmarried woman, æt. 25, never previously tapped, was admitted into the Richmond Hospital under my care in May, 1875. She was somewhat anæmic in appearance, and her catamenia had always been more or less irregular. The tumour she suffered from she first observed twelve months previous to her admission. The tumour was not so large as in the preceding case, measuring only forty and-a-half inches at the umbilicus. On May 12th, there being no contra-indication to the operation, I exposed the cyst in the usual manner and removed the tumour. There were no adhesions, and as far as the operation was concerned, everything went on as smoothly and satisfactorily as any operator could possibly desire. The pedicle, a long and thin one, was secured by a small clamp. No vessels had to be secured, no ascitic fluid was in the peritoneal cavity, nor any escape of ovarian fluid into it. The edges of the wound were carefully brought together by carbolised silk sutures, and the wound dressed in the ordinary manner. Everything went on in the most favourable way for the first twenty-three hours, and when I saw her then, the pulse and temperature were both normal, the expression of her face was cheerful, placid, and free from all anxiety, and, in truth, as she lay in the bed no one from her appearance would have ever supposed that she had so recently undergone a formidable operative procedure. She expressed herself as being quite free from all pain or uneasiness, and was most hopeful of her ultimate recovery.

She had had several hours sleep during the night, the only thing administered to induce it being a quarter-grain morphia suppository. An hour after I saw the patient in this apparently satisfactory condition I was hastily summoned to see her, and was not a little shocked and distressed to see the sudden and alarming change that had occurred. The rate of the pulse from being 84, equable and steady, had risen to 120, and was thready and weak. The face became of an ashy white colour, the lips livid, the voice weak, and the face and hands bathed in a cold perspiration. There was some sickness of the stomach, but the tongue was clean and moist. The patient now expressed herself as being convinced that her end was approaching, which event took place just an hour after the first alarming symptoms of collapse set in. I made a careful autopsy, but failed to discover any cause for the patient suddenly sinking in the manner I have mentioned. There was no distension of the abdomen, no evidence of hæmorrhage, no fibrinous clots in the heart, no peritonitis; in fact, the result of the post-mortem was essentially negative, and the cause of death in this case is, and will probably remain for ever, to me an enigma.

Case III.—An unmarried woman, æt. 30, was admitted into the Richmond Surgical Hospital under my care on June 7, 1877, recommended to me by Dr. M'Dowel, of Sligo. Previous to the spring of 1876 she had always enjoyed excellent health, when about the end of February she first noticed her strength beginning to fail. She soon after this noticed that an enlargement could be felt in the lower part of the abdomen. She stated that at first the enlargement was chiefly confined to the right side. For a period of twelve months there was very little apparent increase in the size of the tumour, and her general health during this time did not deteriorate much except that the languor and the gastric irritability perhaps slightly increased. The catamenia also became scanty, though still continuing perfectly regular in its recurrence. The tumour now commenced to grow more rapidly, her respiration became difficult, and she was greatly annoyed by palpitation on making any sudden exertion. Her stomach began to get irritable and sometimes rejected food. The patient then went to the Sligo Infirmary, where she was admitted under the care of Dr. M'Dowel, and after a sojourn of six weeks came up to town on his recommendation to place herself under my care. Dr. Kidd and his surgical colleagues unhesitatingly came to the conclusion that the tumour was ovarian. Its circumferential measurement at the umbilicus was 41½ inches. On June 27 I performed ovariotomy, the difficulties I experienced being greater than on any previous similar occasion. These were owing to the large number of firm and extensive adhesions which existed for the most part at the upper and posterior part of the tumour. These difficulties were, however, satisfactorily overcome and the tumour removed. There was a good deal of oozing hæmorrhage, but only three small vessels had to be ligatured. Great care was taken not to leave any blood clots or "red serum" in the peritoneal cavity, which was done by the free use of carbolised sponges. The pedicle, fortunately a long one, was clamped, and the edges of the wound brought together by numerous points of interrupted carbolised catgut suture. Very full and accurate notes describing the progress of the case, in its minutest details, to complete recovery have been taken by Mr. J. Knott, now Demonstrator of Anatomy in the school of this College, and the successful result I obtained is, I feel assured, to a large extent due to the unceasing care and attention he bestowed on the patient both previous and subsequent to the performance of the operation. It is unnecessary on the present occasion to say more than that the progress to recovery progressed uninterruptedly, and on July 17 she returned home perfectly well.

Case IV.—An unmarried, fresh-complexioned, blue-eyed, well-nourished girl, æt. 17, was admitted into the Richmond Hospital, under my care, on August 27, 1877. About four months previous to her admission she first observed an enlargement in her abdomen, and the tumour steadily increased in size until it reached the large proportions it had when she came to hospital. Menstruation had for the past two years been very irregular, and a profuse leucorrhœal discharge was observed when she was first examined. One very distressing condition present was extreme gastric irritability. She frequently suffered from retching and vomiting, which nothing appeared to have any effect in checking. The patient occasionally complained of great pain in the tumour, which she referred mostly to the right side. From August 20 to August 28 nothing specially noteworthy occurred. The tumour, however, steadily increased in size, and all her vital functions suffered accordingly. At this time the circumferential measurement at the umbilicus was 35 inches. After consultation with my colleagues I determined to defer any operative measures until the tumour had reached larger dimensions. It now (Nov. 9) measured forty inches round at umbilicus. The patient was much debilitated, from want, I believe, of proper nutriment, for owing to the gastric irritability very little food could be given. On November 10th, assisted by Dr. Kidd and my surgical colleagues, I performed ovariotomy, and experienced, as in the last case, considerable difficulty in severing the cyst owing to the existence of many firm adhesions. These were situated mainly at the upper portion of the tumour. The contents, too, of several

of the cysts were for the most part solid or semi-solid, and could not consequently be removed through the wound until the latter was considerably enlarged. Eventually, however, the tumour was successfully removed, and the pedicle, found to be a long one, secured by a clamp. Great care was taken to remove all clots and red serum from the peritoneal cavity by antisepticised sponges. The edges of the wound were then brought together by numerous points of interrupted carbolised catgut sutures. The progress to recovery of this patient continued uninterruptedly, and on December 20th she returned home perfectly well.

I have purposely avoided giving any minute details of these cases, either previous or subsequent to operative interference. I may possibly publish them with other cases on some future occasion; my main object now being, as I stated at the commencement of this communication, to elicit the opinions from those here this evening who have had experience of ovariotomy, on—first, the value of antisepticism rigidly carried out in all its details in this operation; secondly, on the best method of dealing with the pedicle; and lastly, as to the desirability or otherwise of attending carefully to what Nussbaum calls the "toilet of the peritoneum." On these important points surgical opinion is, I think, still greatly divided as regards one of them. It is, I think, much to be regretted that it should be so, for there can be little doubt (and I say this not only from any experience of the operation I have had, but from what has been recorded by Mr. Spencer Wells, Mr. Keith, and others who have happened to have larger opportunities of acquiring experience of ovariotomy than surgeons in this country), that the mortality of the operation has largely diminished since the principles and practice of antisepticism have become more thoroughly understood and recognised. I entirely dissent from the opinion expressed by Von Nussbaum, that what he calls a "reign of terror" has to be gone through before one can become a successful ovariotomist; in other words, that a surgeon must make up his mind to have a long series of unsuccessful cases before he has successful ones. Formerly there may have been some grounds for holding this opinion, but since the introduction of antiseptics ovariotomy, as Mr. Keith says, "is not the operation it was fifteen or sixteen years ago, or even two years ago." Now, I believe a careful surgeon to have as good a chance of success in his first as in his fiftieth operation.

The best method of dealing with the pedicle is another all important topic, but one on which, like the last, the opinion of surgeons is greatly divided. In my cases I have always hitherto used Mr. Spencer Wells' clamp, and have never found any of the alleged inconveniences of that method of dealing with the pedicle. Mr. Keith, however, observes in reference to this point that "with antiseptics some form of intra-peritoneal treatment of the pedicle will be found to answer best. The clamp has done good service, but it must give way to something better. The mortality attending its use is larger, and the convalescence slower, as a rule, than with the best of the intra-peritoneal methods (*a*.) Von Nussbaum, too, observes that the worst of the use of the clamp is that "we can never know how deep the gangrene of the pedicle may extend, for the pedicle becomes sloughy and offensive, not only above the clamp, but unfortunately often also for some distance behind it." When this occurs, it brings, in his experience, "certain death." Without denying the possibility of this occurring, it is perhaps sufficient to state that it is not apparently the experience of Mr. Spencer Wells, who clearly decides in favour of the clamp over the ligature. He states: "I have gone into the result of the treatment by the clamp and by the complete intra-peritoneal ligature, or what we call the ligature returned. I find there were 627 cases treated with the clamp, of which 130 died, that is a mortality of 20·73. With the ligature 157 cases were treated, with 60 deaths, or a mortality of 38·2. Speaking simply, the mortality is nearly doubled. The mortality of the same operation in the hands of the same operator is 18 per cent. more with the ligature than with the clamp (*a*). Nothing could be stronger than this opinion, and it should, I think, decide us in favour of the clamp in every case where it is applicable. But as all here know, occasionally pedicles are found that are either too short, too thick, or too wide, to admit of the clamp being used, and we must then adopt the ligature either *en masse*, or in several small portions, with strong catgut, as practised by Von Nussbaum, or by Keburlé's method by the wire *écraseur*, or by the cautery.

With reference to the third point I mentioned, viz., what Von Nussbaum calls the "toilet of the peritoneum," or the thorough cleansing from the intestines, omentum, abdominal walls, and the so-called "valleys of the pelvis," of all blood-clots and serum, &c., all ovariotomists appear to be unanimous in considering of the last importance. Yet this importance has only recently been recognised. Some surgeons have even gone so far as to wash out the peritoneal cavity with a 2½ per cent. solution of carbolic acid, and then wipe it out with carbolised sponges. This latter course I would consider unnecessary and unjustifiable.

Much has been said of the mortality after ovariotomy in Ireland, but Mr. O'Grady has shown in his able paper, published in the *Dublin Medical Journal* for Aug. 1874, that the rate of mortality has not been greater here, or as great, as in some of the largest and best known of the London hospitals. Still, the mortality in Dublin admitted by Mr. O'Grady was, at the time he wrote, startlingly great. In a table of twenty-eight operations there were only seven recoveries. Were a statistical table now made of the cases operated on in Dublin since 1874, the percentage of recoveries would, I feel convinced, be far greater. I cannot at present give the exact number of cases operated on in Dublin since Jan., 1864, but I may mention that through the kindness of my surgical friends I have witnessed and assisted at very many of the ovariotomies done in Dublin during that time, and the successful were largely in excess of the unsuccessful results. In the Richmond Hospital I may mention that, latterly especially, the results obtained by my colleagues and myself have been most encouraging. Of the last five operations performed respectively by Drs. Thomson, Stoker, Corley, and myself, there have been four recoveries. One of these cases I should not, perhaps, in strictness include, as it was not exactly an ovariotomy, but even a more formidable procedure. I allude to a case operated on by Dr. Thornley Stoker, where a uterine tumour of enormous dimensions was successfully removed. These eminently satisfactory results I believe to be largely due to an adherence to antiseptic practice, even though, on my part at all events, it may not, perhaps, have been carried out as rigidly as it might have been.

# Clinical Records.

## NOTES ON A FEW CASES OF PHAGEDÆNA IN THE FEMALE LOCK HOSPITAL, LONDON.

(Remarks by Mr. G. Hamilton Bishop, M.R.C.S.)

Under the care of Mr. Buxton Shillitoe.

Case I.—A. G., æt. 19, admitted with several sores on left nymphæ which had taken on phagedænic action. The ulcerations were dressed with a lotion containing cupri sulph., gr. x.; tinct. opii ʒij.; lotio nigra, ʒix.; and she took a mixture containing 15 grs. of bromide of potassium, as she had been drinking heavily and was shaky. The sores soon cleaned under this treatment; in twelve days they were dressed with iodoform, and in twenty-six days were quite healed.

Case II.—N. M., æt. 24, admitted with sloughing phagedæna of both labia and nymphæ, with great destruction of parts. She was treated locally with tinct. ben-

zoin co., and internally, sulphate of iron and magnesia. This was a tedious case, owing to the extensive destructive ulceration, but finally healed under iodoform or black-wash.

Case III.—N. R., æt. 24, admitted with large phagedænic ulceration extending over the inside of both nymphæ and across the inferior commissure. Treated throughout with iodoform ointment, 15 grs. to ℥j. of vaseline.

Case IV.—H. F., æt. 18, admitted with suppurating sores at inferior commissure and around vaginal orifice, and a phagedænic ulceration over lower part of sacrum. This was dressed with tartrate of iron, ℥j. ad ℥j., and soon healed.

Case V.—M. A. L., æt. 24, admitted with severe deep sloughing phagedæna on inside of left thigh. Treated locally with Little's soluble phenyl, and internally cod-liver oil and citrate of iron and quinine—being very thin and anæmic. The ulceration cleaned and progressed favourably, though slowly, being very deep. An eruption of roseola made its appearance ten days after her admission, but soon faded.

Case VI.—E. B., æt. 24, admitted with severe sloughing phagedæna of both labia and nymphæ, with great destruction of parts; she was in a very anæmic and low condition. Treated locally with a lotion of tartrate of iron, ℥j. ad ℥j., and sloughing arrested, though both nymphæ were lost. Fourteen days after admission a tubercular syphilide made its appearance. The ulceration very quickly healed considering its extent.

Case VII.—E. B., æt. 21, admitted with phagedænic ulceration at inferior commissure, and a few mucous tubercles around anus. Treated locally for a week with Little's soluble phenyl, which arrested the phagedænic action, and subsequently with tartrate of iron.

Case VIII.—F. B., æt. 17, admitted with extensive phagedænic ulceration around vaginal orifice, and on inside of left labium. Treated locally with a lotion of tartrate of iron, ℥j. ad ℥j., and the ulceration healed.

*Remarks.*—These patients were (with the exception of Case VI.) prostitutes of a destitute class, living in low parts of London, and addicted to habits of intemperance (Case I., presenting symptoms of incipient delirium tremens), and were all miserably clad, ill-fed, and very dirty, showing that (as I believe) phagedæna arises from their remaining in this state of dirt, neglect, and intemperance, rather than the result of syphilis. Three of these cases were followed by slight constitutional syphilis, one having roseola, another, slight mucous tubercles, and a third, a tubercular eruption.

Mr. Babbington says: "The secondary symptoms which follow the phagedænic sore are peculiarly severe and intractable."

Those cases which have not been succeeded by secondary symptoms have been under observation (with the exception of Case I.) for several months, and have not yet shown any sign of being constitutionally affected.

*Treatment.*—The treatment adopted varied, as will be seen by reference to the cases—tartrate of iron being used most frequently. We adopted formerly the prolonged use of the warm bath, also the heroic treatment of thoroughly mopping the sores with pure nitric acid, pure carbolic acid, or using Dr. Paquelin's thermo-cautère, but we very seldom use them now, finding the cases yield to cleanliness, nourishing diet, and careful dressing with any of the preparations used in the above-mentioned cases.

---

We regret to hear that Dr. Millerchip, one of the medical officers of the Coventry Union, was committed for trial at an inquest last week, on a charge of manslaughter for alleged neglect of duty in not attending an infant child, named George Bastock, who died without medical assistance, although Dr. Millerchip had been repeatedly requested to attend.

# Transactions of Societies.

## SURGICAL SOCIETY OF IRELAND.

SESSION 1878-79.

FRIDAY, JANUARY 17TH.

The Fourth Meeting of the Session was held at the Royal College of Surgeons,

Mr. P. C. Smyly, President of the College, in the Chair.

Mr. Tufnell (hon. sec.), read the minutes of the previous meeting, which were signed.

Mr. Wheeler submitted a

SPECIMEN OF CANCER OF THE BREAST,

taken from a lady, æt. 31, who had been married three years, and had borne one child. As far as he could ascertain, the disease commenced eleven months ago. The disease appears to have commenced at the internal side, and to have attacked one lobe of the gland and not to have proceeded to the other lobe until a recent date. It appeared that the disease did not exhaust itself in the gland, but attacked one lobe, leaving the other free. A great many of the authorities set down from 30 to 50 as the period of age when the disease was most common, while Burkett stated the climacteric period to be from 45 to 50.

SPECIMEN OF STRUMOUS DISEASE OF THE WRIST-JOINT.

Mr. Ormsby submitted a hand and portion of the forearm which he removed from a girl in the Meath Hospital for strumous disease of the wrist-joint. The disease had existed for the last fourteen months. Every possible remedy was tried in the shape of medicated applications; and on one occasion, an incision was made over the part so as to remove the diseased bone. However, her symptoms became gradually worse. He had lately adopted a solution of chloride of zinc—40 grs. to the ounce—for swabbing out wounds; and he found that very little, if any, pus was formed after it.

Mr. Kelly presented a

SPECIMEN OF FRACTURE OF THE LARYNX AND HYOID BONE,

which he had removed from a patient who died last Tuesday in Jervis Street Hospital. The circumstances of the case were peculiar. The subject had been suffering from epilepsy 13 or 15 years. Some eight years ago he had had seizures three or four times a month; and subsequently they increased until within the last few weeks, when they occurred sometimes to the number of thirteen a night. He was admitted at half-past 7 on Tuesday morning. When Mr. Kelly saw him he was violent and delirious, and required to be held in bed by three or four attendants. He complained of some sharp bone cutting into his throat. Mr. Kelly passed a probang into his stomach without difficulty. The patient then changed his exclamations, and said a worm was coming up his throat. Every time he perceived a sensation or aura he seized himself forcibly by the throat, and it required a considerable amount of strength to remove his hands. He was put under treatment, and after being in the hospital three or four hours he suddenly expired, after getting a drink of water. Having made a post-mortem examination, Mr. Kelly found the heart perfectly sound and also the brain; but the lungs were in a peculiarly-marked condition of congestion. The blood gushed through the incision as if from a mass of wounded veins. The brain was remarkably anæmic, and the entire body, as far as he observed, seemed to be in a healthy condition. He then examined his throat, and found (as would be perceived on the specimen), the hyoid bone fractured at the junction of the right cornua with the body. The thyroid cartilage, also, was fractured to the right of the mesial line. Several extravasations occurred in the deeper tissues along the right side of the neck. His method of strangulation was by pressing his thumb forcibly backwards and slightly towards the left. It required all their exertion to take his hand away from his throat. An inquest was held, and the evidence went to show that the injuries were self-inflicted.

Dr. Lombe Atthill read a paper on

OVARIOTOMY—SPECIMENS OF TUMOUR,

which will be found on page 118.

Mr. Stokes also read a communication on the same subject, which will be found on page 120.

Dr. ATTHILL—I might remark that that woman who had not menstruated for a year began to menstruate in six or eight hours afterwards, and has menstruated regularly since.

Dr. KIDD—I have used both the clamp and the ligature; and I confess I do not attach very great importance as to which of those methods is used. Dr. Marion Sims recently read a paper, and the opinion he arrived at is, and my own experience coincides with it—that it is not very material which of those methods you adopt. I believe some of the greatest successes in the operation have been achieved by the old method of using the ligature, and allowing the ends of the ligature to hang out. That was the method used by Dr. Charles Clay in his operations, and his success was certainly very large. There is an advantage attendant on the ligature hanging out—namely, that it serves the purpose of drainage in allowing fluids to escape. With this advantage it must, of course, be at the same time remembered that the ligature constitutes a foreign body in the peritoneum, and being necessarily in contact with air and unhealthy discharges is favourably circumstanced for putrefaction to take place, but it very soon becomes enclosed by a deposit of fibrinous adhesions, so that the peritoneum is cut off from it. In this way only I can understand it was not followed by fatal results in almost all the cases in which it is used. In my later operations I have adopted the plan of cutting the ligature and dropping the pedicle into the abdomen. If you have a short pedicle to draw it out of the abdomen and fix it with the clamp, you necessarily draw the uterus forward, and cause great tension. So it is a much better practice to ligature the pedicle and drop it into the abdomen. If, however, you have a long pedicle that you can draw freely forwards, without disturbing the position of the uterus, my inclination would be to use the clamp. That is the principle that has, at all events, guided me. In my latter operations, it so happened that my pedicles were short, and therefore, I ligatured them, and dropped them in. Ligatures left in the abdomen that way, after all do very little injury. I think I have at present four patients in perfect health, and they have each of them from six to seven pieces of hemp in the abdomen, and never exhibited the least inconvenience. I believe I saw most of the cases that Mr. Stokes and Dr. Atthill have related. In the first case, that of the tumour, was about the largest ovarian tumour I ever saw. It puts me in mind of a case of Dr. Clay's. The patient was brought to him in an omnibus: she sat on one side of the omnibus, and her ovarian tumour was supported on the opposite side, it was so large. Dr. Atthill's was not quite so large, but very nearly approached it. Dr. Clay's case shows that the enormous size of the tumour does not prohibit the operation—for his patient recovered without a bad symptom. The question of adhesion has attracted a good deal of attention. I have had a run of cases where there were very great adhesions, they were almost universal. Certainly, I think in the last four cases I operated upon there was not a particle of tumour that was not adhering, and yet in every one the patient recovered without a single bad symptom. I believe in the last case I operated upon I had every moveable organ in the abdomen out lying on the table; and that woman recovered. Her pulse never exceeded 100; her temperature never raised; she never vomited; and never had a bad symptom. As to the toilet of the peritoneum, I look upon that as one of the most important points in the practice of ovariotomy. I think it is a far more important point than the method of treating the pedicle. If you leave clots of blood or red serum it will most probably become putrid, and you will have a low form of peritonitis set up—a circumstance that most materiall y contributes to fatal results. In several instances, where there was a great deal of serum, I have adopted Gabriel's plan of introducing a glass drainage tube alongside the pedicle with very good results; and one of the advantages of the clamp is that you can use the drainage-tube along with it. Dr. Peaslee records a very remarkable case illustrating the importance of attending to the matter, where, for forty days, he had to wash out the peritoneum to remove the products of putrefaction. A portion of the incision remaining open, he introduced a tube and washed it out with a weak solution of salt (commen chloride of soda). His patient recovered perfectly. An objection has been made to the use of the clamp that afterwards, when the patient menstruates, the menstrual fluid will escape at the cicatrice. I am quite sure that that is an objection; it has occurred with two or three of my patients. For months after the operation every time they menstruated the bloody fluid escaped at the seat of the wound, though apparently quite healed. On the other hand, those who prefer the clamp make this an objection to the use of the ligature and dropping it in—that if the menstrual fluid is to escape, it is much safer that it should do so from the skin than the cavity of the peritoneum. That is the theoretical objection made to the ligature. But so far as my own experience goes, I never heard of any consequence arise from the fluid escaping from the ligature and stump. Probably, it becomes completely encysted, and in that way so sealed up that very little could escape through it. In one of my cases I had a good deal of uneasiness, where a considerable time after the operation there was an escape of serous fluid from the seat of the wound. In fact, it was a case where the adhesions were so extensive that I cut off a portion of the cyst attached to the intestine and left it in the abdomen. For nearly a year afterwards that woman had a small fistula open at the seat of the wound, through which serous fluid escaped. It was a case in which the adhesions were so close I had to ligature seven of them, and I left the ligatures in the abdomen. At first, when I found the serous fluid escaping, I was very apprehensive that I had divided the ureter, or included it in one of the ligatures. However, the fistula has quite closed, and the fluid proved to be nothing but serum. It is now four or five years since, and the patient is in perfect health.

Mr. THORNLEY STOKER bore testimony to the value of the drainage tube. In a case of large fibrous tumour, which he operated on—referred to by Mr. Stokes—he introduced a glass drainage tube at the side of the pedicle, the latter being the cervix of the uterus. He felt sure the recovery of the patient was due in great degree to the presence of the drainage tube. The adhesions were very extensive; and he was obliged to draw the omentum off, like an apron, from the surface of the tumour, in great sheets, and apply three ligatures. In consequence there was a good deal of suffering, and an escape through the drainage tube afterwards of a very large quantity of extremely offensive purulent fluid; so offensive in character that he could scarcely conceive its being absorbed, and the patient making a recovery were the drainage tube not present. The same case also bore out what Dr. Kidd had said in reference to the little harm those foreign bodies created from being left in the peritoneum cavity. His own patient, who had three ligatures at all events in some part of her abdomen, was in vigorous health, and suffered no inconvenience. The ligatures encircling the cervix uteri came away afterwards; those affixed to the omentum remained behind.

Mr. WHEELER did not agree with Mr. Stokes that the cause of death in the second case was at all enigmatical. In a case in which he himself operated at one p.m. the patient was exceedingly well up to next morning, when she showed signs of collapse, a small pulse, and she died about two o'clock in the day. So small did the pulse become, he thought there was internal hæmorrhage. He believed she died from cumulative, or what the old writers called secondary, shock, which was, he believed, the cause of a great many deaths in ovariotomy. As to the washing of the peritoneal cavity, it depended greatly on what occurred during the operation. If they could remove the cyst without breaking it, or letting any fluid get into the cavity of the peritoneum, or the operator put his hand in, it would not be advisable to wash it out; but if any fluid got in, it would be better to wash it out with carbolic acid than run the risk of allowing it to remain. In one of the medical journals he read of a case in which, some days after the operation febrile symptoms became aggravated, and there was an accumulation of fluid, which the operator let out by making an opening into the vagina; and it was followed by excellent results. He thought that tying the pedicle, and passing in the drainage tube would be preferable to having the ligatures come out through the wound. It would be far more preferable to cut the ligatures short than to leave them hanging out, and carry out the principle in its entirety than partially.

Mr. ORMSBY asked the authors of the communications to state what anæsthetics they considered best.

Mr. THOMSON considered the comparison made by Mr. Wells of the two processes of treating the pedicle, by the clamp and by the ligature, as scarcely fair. Mr. Wells had compared the results in 600 or 700 cases of treatment by the clamp with the results of 160 by ligature; and had probably been carried away by too great a conservative affection for his own method, and inclined to cast discredit on what was really the older plan that was now coming into more general use; namely, ligature of the pedicle, and which was the plan adopted by Mr. Thornton, one of the most rising operators

in ovarian cases in London. As to the use of antiseptics, if there was any operation in which antiseptic precautions ought to be of any use, it was in that of ovariotomy, where such a delicate membrane as the peritoneum was exposed, together with the whole cavity and organs, to whatever contagion might be in the air. In a case he operated on himself, he used thymol spray as a more powerful germicide, and less irritating in its action on the peritoneum than carbolised spray; and on the fifth day after the operation the parts were entirely healed. As to the toilet of the peritoneum, much depended upon it. It was suggested to him by Dr. Kidd to carry out Wells' plan of using round needles, instead of the usual triangular surgical needle, which was very apt to be followed in some cases by considerable oosing into the peritoneum; oozing from which he believed, in not a few instances, death had ensued.

Prof. BENNETT concurred in the error of comparison pointed out by Mr. Thomson. Admitting the necessity of antiseptics, the clamp or ligature might be used as either suited.

Dr. KIDD thought some confusion existed. The ligature had been mentioned as an old method and a new, and the clamp as Mr. Wells' invention. He believed the first method of treating the stump was the ligature, leaving the ends hanging out. The next step was Hutchinson's invention of the clamp, consisting of two parellel bars. Then Wells invented his clamp, which was more like a carpenter's compass. The bars did not act parellel, but on a pivot at one end, and were secured by a screw at the other. Next, Smith invented the method of using the wire ligature, and dropping it into the peritoneum. Then, Dr. John Clay, of Birmingham, suggested the plan of dividing the stump with actual cautery, and dropping it into the peritoneum. Lastly, came the method of using the ordinary hemp ligature, cutting it short, and dropping it into the peritoneum. These were the successive steps, except one suggested by Sir James Simpson, which, however, was not so far as he was aware, put into practical use; the method of treating it with a moveable wire ligature, something in the way he suggested for the treatment of arterial hæmorrhage generally.

Dr. ATTHILL, in reply to Mr. Ormsby said, the anæsthetic he used in the last ten or twelve operations was ether, believing it to be much safer than any other for a long operation. In one under chloroform for vesico-vaginal fistula the woman nearly lost her life; but twice afterwards, under ether, she bore it beautifully. He administered the ether with "Mr. Ormsby's inhaler," which answered very well. In the treatment of the pedicle he used the clamp as often as the ligature, but he found the latter much more satisfactory, and though not wedded to it he gave it the preference. Dr. Kidd used them according as they suited—if a long pedicle, the clamp; if a short, the ligature. The figures given by Mr. Wells as to the comparative results of ligature and clamp were certainly fallacious, as having been drawn from operations under the same hands, and the ligature therefore used in the unfavourable cases.

Mr. STOKES said ether was the anæsthetic they always employed in the Richmond Hospital, whether in long or short operations, and it would be satisfactory to Mr. Ormsby to know that his inhaler was the one which he (Mr. Stokes) always used. In one case Mr. Ormsby himself administered it with his inhaler, which answered extremely well. He regretted to say that, so far as he was concerned the explanation of the cause of death given by Mr. Wheeler, in the case he had mentioned, was not satisfactory, and still remained to him an enigma. Mr. Wheeler had explained it by supposing it to be the result of "secondary shock," a term which he mentioned was used by the older writers. To his mind, "secondary shock" was nothing more or less than giving expression to a condition of a nature which they did not at all comprehend. Therefore, having regard to the negative character of the autopsy, he thought he must still remain in ignorance of the death of the patient. He had to express his satisfaction that what he had stated in reference to dealing with the pedicle had been so fully endorsed by such an experienced and distinguished ovariotomist as Dr. Kidd. He had stated that pedicles were frequently met in which the clamp could not be used, and in such case the ligature or some other method should be employed. His own partiality for the clamp had arisen from its being first introduced, from not having any foreign body left in the peritoneal cavity, and from the results of the vast experience of the most celebrated ovariotomist living—Spencer Wells, who had declared his preference for it. He should be sorry it was thought he was of opini 'hat the clamp and no other instrument should be used in dealing with the pedicle.

The Society then adjourned.

# Department of Lunacy.

## THE MURDERER PEACE.

FROM a psychological point of view the character of this man presents rather a curious study. He seems to be one of those exceptional beings in whom there is an almost innate criminal propensity, and whose infamous practices are in themselves as great a source of pleasure and satisfaction as the booty derived from them. Not long ago a distinguished German psychologist asserted that his studies led him to regard the impulse of criminal nature in the light of natural laws. He said that an "anthropological change," or, in other words, a defective organisation of the brain lies at the foundation of the criminal propensity of habitual thieves, murderers, &c.—that the cerebral changes were of so gross and palpable a nature as to admit of easy demonstration in the *post-mortem* room—and that they might even be recognised during life by a careful examination of the criminal's head. Whether the conformation of Peace's cranium or brain is different from that of most people, we will not venture to say, but judging from his photographs, a man like Professor Benedikt of Vienna might certainly find some further data for his doctrines in an examiuation of the prisoner. Be this as it may, we have no doubt that the cerebral organisation of a hardened and determined fellow like Peace must be very different from that of ordinary individuals, although we do not for a moment believe that the difference is of so gross and palpable a nature as to be detectable after death, much less before it. None the less true, howevever, is this materialistic view of the criminal propensity—a view which, unfortunately, precludes all hope of our ever permanently ridding society of such characters. As long as human nature is as it is, we shall have amongst us thieves, murderers forgers, *et id genus omne*. No amount of education, no penal codes, no force of example, no religious or moral suasion, will deter such men from their evil courses, or induce them to lead an honest life. Indeed, the very propensity which seems to be "born and bred" in their flesh is fanned and encouraged by the morbid interest and sympathy of society which considers itself outraged by their acts. When well-dressed ladies contend for the opportunity of looking at these villains through their opera-glasses, and special correspondents are told off to watch and record every change in the features of the criminal, and every word or whisper that escapes his lips, can we wonder that such men may even feel as much pleasure and pride in being infamous as their more discreet neighbours do in being honest or famous?

## ARE INEBRIATES AUTOMATONS?

SUCH is the question which Dr. Beard, of New York, puts to the American Association for the Cure of Inebriates at Boston, and which he has no hesitation in answering in the affirmative. "So long as a man is merely a drunkard he has it in his power to reform if he have a good endow-

ment of will and can keep out of temptation. But in the disease of inebriety the sufferer has little or no more volitional control over his drinking symptoms than has a sufferer from neuralgia, or from sick headache, or from hay-fever." We admit there are a few exceptional cases in which uncontrollable drunkenness may be viewed in the light of a disease, or as a species of insanity, but these cases must be very few. At all events, the principle of looking upon "dipsomaniacs" as bereft of all voluntary control over themselves is a very doubtful one; inasmuch as the more this class of people are brought under the subjection of others, the less likely they are to exercise what little will they have of their own. We are all, to a certain degree, more or less automatons, but it would be very unsafe practice to carry out this doctrine to its logical conclusions. The thief, the burglar, the murderer may be regarded as automatons, and as having impulses over which they have no control. But the principle on which we deal with such criminals should, with certain reservations guide our treatment of the habitual drunkard. Admit that he knows what he is about, that he has more command over himself than his friends suppose and by all possible means, deter him from continuing the course he is taking.

---

## PSYCHOLOGY OF HAMLET.

"Quem deus vult perdere, prius dementat."

By L. S. FORBES WINSLOW, D.C.L. Oxon., M.B. Camb., M.R.C.P. Lond.,
Lecturer on Mental Disorders, Charing Cross Hospital.

The mental condition of Hamlet has frequently been discussed, and various interpretations have been given in connection with the subject. Shakespeare intended Hamlet to be a man of passionate disposition, of noble and gentle temperament, most affectionate, devoted to the memory of his father, and indignant with the absence of shame in his mother.

"Frailty, thy name is woman;
A little month or ere these shoes were old
With which she followed my poor father's body,
Like Niobe in tears; why she, even she—
O God; a beast, that wants discourse of reason,
Would have mourned longer—married with my uncle."

The play thus commences with a delicate youth, with feelings of grief mingled with disgust, who had doubtless reflected for some time upon a theme which was both repugnant and harrowing to his sensitive nature, and which rendered his mind liable to be unhinged by the slightest provocation. The primary cause for the sudden outbreak of Hamlet's madness may be traced to the appearance of his father's Ghost, causing a state of excitement, but calming down by degrees as the vision disappears. The first evidence of his mental aberration occurs in the scene when the apparition has left him and he is asked by Horatio what secret has been divulged—

"There's not a villain in all Denmark,
But he's an arrant knave."

To which Horatio replies,

"These are but wild and whirling words my lord."

This is the first allusion to the wildness and unnaturalness of Hamlet's disposition. Another early indication of his condition occurs in the interview between Ophelia and her father—

"My lord, as I was sewing in my closet,
Lord Hamlet with his doublet all unbraced;
No hat upon his head; his stockings fouled,
Ungartered and down-gyved to his ankle;
Pale as his shirt; his knees knocking each other;
And with a look so piteous in purpose
As if he had been loosed out of hell,
To speak of horrors,—he comes before me."

In this scene Polonius alludes to the return of the gifts made by Hamlet to Ophelia as the cause of his madness—

"That has made him mad."

In the following scene we find Rosencrantz and Guildenstern, both intimate friends of Hamlet, sent by the King to act as attendants and watch over his personal liberty. From a previous acquaintance with him it was not to be expected that a suspicion would be cast on the motive of their visit to Denmark and intrusion on his presence. The Queen instructs them thus—

"Good gentlemen, he has much talked of you;
And sure I am two men there are not living
To whom he more adheres,
And I beseech you instantly to visit
My too much changèd son."

There can be no doubt but at this period of the play Shakespeare regarded Hamlet as a madman, driven to desperation by all that he had gone through. A mind embracing both gentleness and firmness, naturally of a strong melancholic temperament, of a highly reflective character, stung to remorse and terror by the villany of his uncle—the murder of his father, and the incestuous behaviour of his mother, all acting as excitants in one already predisposed to melancholy, and prostrating by their baneful influence his mind and producing the condition as described and depicted by the dramatist. Polonius, who was of a crafty and knowing disposition, and ever eager to express his opinion to the King, considered that he had found out the cause for this strange change in Hamlet's mind,

"I have found the very cause of Hamlet's lunacy."

Of course he here alludes to the supposed affection for Ophelia, about which however there is a diversity of opinion as to whether Hamlet really loved Ophelia or not. He is evidently conscious of his condition, for he perceives that he is being watched by Rosencrantz and Guildenstern and under their supervision, Hamlet asks them a direct question—

"Were you not sent for? Is it your own inclining? Is it a free visitation? Come, deal justly with me; come, come; nay, speak."

This remark is made to them in reference to their sudden visit to Denmark. Again,

"What have you, my good good friends, deserved at the hands of Fortune, that she sends you to a prison hither."

It has often been argued from Hamlet's conversation here that he was feigning madness. This, to my mind, is however contradicted in the beautiful speech describing his melancholic brooding, which frequently has been brought forward as a typical illustration of a melancholic temperament. Burton, in his "Anatomy of Melancholy," who was a contemporary of Shakespeare's, has also depicted this condition; he writes—

"They are soon tired with all things; they will now tarry, now begone; now in bed, they will rise; now up, then they go bed; now pleased, then displeased; now they like, then dislike all." "*Sequitur nunc vivendi nunc moriendi, cupido,*"

As Aurielianus says.

Hamlet thus describes his melancholic disposition—

"I have of late—but wherefore know not—lost all my mirth, foregone all custom of exercise; and indeed it goes so heavily with my disposition that this goodly frame, the earth, seems to me a sterile promontory; this most excellent canopy, the air, look you, this brave o'erhanging firmament, this majestical roof fretted with golden fire,—why it appears no other thing to me than a foul and pestilent congregation of vapours."

Suicidal tendencies are always present in connection with melancholia. Shakespeare, mindful of this, introduces in the following scene a speech as illustrative—

"To be or not to be, that is the question."

From the context this evidently refers to the contemplation of self-destruction. The interview between Hamlet and Ophelia, in which she is informed that he never loved her, is characteristic of a mind unhinged—

"O, what a noble mind is here o'erthrown."

His melancholic state gradually subsides into one of subacute mania, reaching its culminating point in the scene with the players, where he finds the account given by the Ghost of the murder of his father corroborated—

"Now could I drink hot blood, and do such bitter business as the day would quake to look on."

After the interview with his mother and the murder of Polonius, Hamlet is sent to England under the charge of Rosencrantz and Guildenstern, to whose protection he has been entrusted by his uncle—

"And he to England shall along with you."

On his return home Hamlet meets the *cortège* bearing

the "Fair Ophelia." After this there is no history of any lunacy, and he continues in a sound state of mind until the termination of the play. As a substantial proof of this I must refer to the speech made by him to Laertes previous to their duel. It is, however, to be regretted that this is omitted in the present version of the play. Upon this the whole question hinges as to whether he was feigning madness.

"Give me your pardon, sir, I have done you wrong;
But pardon't as you are a gentleman.
This presence knows, and you must needs have heard,
How I am punished with a sore distraction.
What I have done,
That might your nature, honour, and exception,
Roughly awake, I here proclaim was madness."

He declares further on in the same dialogue that he destroyed Polonius and drove Ophelia to distraction under the influence of insanity. He says that "his madness is poor Hamlet's enemy."

The inference to be gathered from this is either that Hamlet was sane and excused himself on a self-imposed plea of madness, or that he was conscious of his previous irresponsibility, and was eager to explain the reason for his misdeeds.

There is sufficient evidence from a careful examination of the traits in his character to ignore the first plea. Hamlet was not a coward. He would not have made use of deception to escape calumny and disgrace. On the contrary he was brave, truthful, honourable, and resolute, and I cannot admit that he was a man likely to purposely deceive Laertes. It was contrary to his nature and to the history of his case.

The general conclusion I have arrived at is that there is no evidence to prove that Hamlet feigned madness, and that tracing the delineations of his disposition carefully, there are conclusive facts of the existence of mental aberration, followed, as I have shown, by complete restoration to health previous to the termination of the play.

I am desirous of saying a few words on the performance of Hamlet at the Lyceum Theatre. With regard to the portrayal of Ophelia by Miss Ellen Terry, a character so redolent of feminine gentleness, beauty, and grace: It has been argued by some critics that there is not sufficient acting in the part. It appears to me a most perfect representation of what Shakespeare intended, the personification of a love-sick girl, whose mind is wrecked, giving vent, during her insane warblings to ideas which could never have suggested themselves to any one but the possessor of a "mind diseased," a mind prostrated and perverted, and to one who had lost control over her better reason, reduced to a state of disordered instinct and imagination. All this is displayed by Miss Ellen Terry. The great error to guard against in a true representation of Ophelia is over action and exaggeration. This is carefully avoided. It is a most difficult thing to feign madness, from the tendency to overdo the part and exaggerate the symptoms. Exception has again been taken to the tears shed in the mad scene as being contrary to what is found in insanity. The now popular notion that persons who are of unsound mind do not shed tears is a fallacy. It is erroneous and contrary to all experience.

The Ophelia of Miss Ellen Terry is true to nature, and may be pronounced a most brilliant representation. The masterly performance of Hamlet as rendered by Mr. Irving is so well known as not to require any further comments from me. The character is depicted with the skill of a consummate artist. I have heard that to produce Hamlet as it is now acted at the Lyceum Theatre, has been the study of a lifetime, and Mr. Irving must be congratulated upon the great success of his undertaking.

---

PECULIAR IDEAS OF PERSONS ALLEGED TO BE INSANE.—In a pamphlet which came under my observation lately, the thoughts and doings of an eccentric individual were described. He fancied he attracted the notice of strangers in the streets, and he asked himself the following questions: "Are the passers-by afraid of me?" "*Do I stink like a beast?*" I shall be glad to know whether there is any truth in the notion that the skin of mad people exudes unpleasant odours, and if so, how can the condition be accounted for?—PSYCHOLOGICAL ENQUIRER.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, FEBRUARY 12, 1879.

## THE PLAGUE.—I.

THE PLAGUE—a pestilence more dreadful and more fatal than all the pestilences which have from time to time attacked the human race—has, after a long absence, made its appearance in Europe. Nations which were but recently armed against each other, or actually engaged in mortal conflict, are now considering how they can best defend themselves against a common enemy, one more formidable than any they have been preparing to encounter; and Russia, which has so long disturbed the peace of Europe, now threatens that continent with a scourge that may rival her armies in the havoc with which its progress may be marked. Germany, and Austria, and Turkey, are endeavouring to erect an impassable barrier to the transit of this dreaded pestilence into their respective territories. Imperial ordinances from Berlin, from Vienna, and from Constantinople, have been issued, prohibiting the importation of a large number of articles from Russia. The Chamber of Deputies at Bucharest, have noted a credit of 500,000 francs for defraying the expense of establishing a military cordon and quarantine upon the Russian frontier, in common with the measures adopted by the Vienna International Commission. Medical men have been dispatched to Russia from all quarters, in order to ascertain the character and extent of the epidemic. Special Governor-Generals have been told off to take charge of infected districts; and, with the view of stamping out the plague in certain places where it has broken out, whole villages have been burnt down, and their inhabitants removed to other quarters.

Nor can we wonder at this wide-spread panic, or at the extraordinary precautions that have been taken, when

we consider what the Plague is, and the mischief it has done. Perhaps, too, on the principle of *omne ignotum pro magnifico*, the little personal knowledge or experience which most people, not excepting the medical profession, have of this pestilence, has somewhat heightened the terror with which it is regarded, as we are naturally less fearful of those evils which are constantly in our midst, than of those which merely threaten us at a distance, and the gravity of which is magnified either by our own imagination, or by the reports that have reached us respecting them.

It is, however, doubtful whether either imagination or report has much exaggerated the formidable character of the true plague. Rigors, or a feeling of general debility and languor; nausea or vomiting; extreme anxiety, terror, restlessness, and fear of approaching death; a heavy, stupid, or anxious expression of the countenance; a weak, frequent, or irregular pulse, and a tendency to syncope; great fetor of the breath, great thirst, and a furred, or dry, brown, and even black tongue; in some continual watchfulness, in others an overwhelming somnolency; diarrhœa with offensive stools, fetid perspirations, hurried respiration; hæmorrhage from the nose, from the lungs, or some other part of the body; scanty, high-coloured, or bloody urine; purple, or black spots, or even livid patches, and ecchymoses in various parts of the skin; tumours, buboes, or carbuncles in the groins, armpits, neck, &c., which may form abscesses that discharge, heal slowly, and leave permanent scars; and withal great prostration of strength, delirium, coma, and sometimes convulsions—these are some of the more prominent symptoms that characterise an attack of true plague. And yet there is nothing in these symptoms to make this pestilence more dreadful than several which occasionally occur, or which are actually endemic, in this country. Even those who are attacked with the worst and most fatal form of the disease, do not present such a horrid aspect as they do who are carried off by malignant cholera; nor do those who are attacked with the petechial or bubonic form of the plague, appear half so loathsome, horrible, and disfigured, as those who have but recently, fallen victims to the worst forms of confluent or hæmorrhagic small-pox. It is the virulent and highly contagious nature of the plague, the extraordinary mortality that it has occasioned in different countries, and above all, the rapidity with which it smites down the old and the young, the feeble and the strong, that have invested it with a horror which belongs to no other disease. The number of people that have fallen victims to this pestilence, testify equally to its contagiousness and its great fatality. Hecker calculates that in the 14th century, Europe lost by the black death, as the plague was then called, no less than 25,000,000 of its inhabitants. This may have been an exaggerated estimate, but judging from the more reliable records of recent times, he was probably not far wrong. During that same period the mortality in Florence was 60,000, and in Venice, 100,000; while Marseilles lost in one month, 16,000 of her inhabitants. During the great plague of London in 1664, 68,596 of the population were carried off, as many as 8,000 dying in one September week. The rapidity with which some were struck down with the disease was one of its most appalling features. Some were attacked with the pestilence as though they had been struck by lightning. Some of the infected ran about staggering like drunken men, and fell down dead in the steeet. Some lay vomiting, as if they had taken poison. Some fell dead in the market in the act of buying provisions. One man falls suddenly down in the street, and is carried home. Carbuncles and buboes break out in different parts of his body on the same day, and he dies three hours afterwards. Another is smitten suddenly, and feels as if two musket balls had passed through his groins. He becomes giddy and delirious, has green vomiting, and falls senseless to the ground. A gentleman's servant, within half an hour after appearing in good health and spirits, rushes into a room, with his eyes "starting from his head," and exclaiming, "open the gate for me, for I am smitten;" the next day he expires; and within thirty hours after the seizure, his body is in such a deplorable state that his feet are quite putrefied. Not less alarming is the contagious properties of the disease, and the celerity with which it has attacked one victim after another. In one large foundling hospital, containing between 300 and 400 foundlings, besides officers and attendants, a female patient was incautiously admitted suffering from the premonitory symptom of the disease. The next day, the two servants who had conducted her to her bed, fell ill and died in a few hours. The following day the matron fell ill, and died almost as suddenly. The pestilence then spread "with amazing rapidity, and destroyed all the children, with every person belonging to the house, excepting about thirty, and these took the infection, but recovered." Indeed, when one person in a family was attacked and died, the rest soon followed. In every outbreak of the disease, whole families were entirely destroyed in this manner. So quickly did the people die in many instances, that the removal and interment of the dead was a great source of embarrassment to the authorities. In one place, beggars and vagabonds were employed in casting away the dead bodies; but these were soon seized with the distemper, and those who followed them in their offices soon followed them in their fate. Convicts were then taken from the galleys, and promised their liberty if they survived. The first supply amounted to 133, every-one of whom perished within a week. A hundred more were then granted, and in six days they were reduced to twelve.

No wonder that in an age remarkable for its ignorance and superstition, people were panic-stricken beyond all bounds; that not only the clothes, and everything belonging to the infected, were regarded with the greatest aversion, but every spot which the sick had touched; that even the eyes of the patient were considered as sources of infection; that the Flagellants marched through the streets of Europe, lashing themselves until the blood flowed from their naked backs; that parents abandoned their infected children, and children their infected parents; that all the ties of kindred were dissolved, that, in the words of Hecker, Charity was dead, and Hope laid prostrate. Judging from the records of actual cases of the disease, from the accounts of eye-witnesses, and from the reports that have recently reached us from the East, it is doubtful whether the imagination of De Foe has too highly-coloured his descrip-

tion of the Great Plague of London, considering the circumstances under which that plague occurred, and the insanitary condition of the metropolis at that time. In some houses, says De Foe, carcases lay waiting for burial; and in others, persons were seen doubled up in their last agonies. In one room were heard dying groans; and in the next the ravings of delirium. . . . Infants passed at once from the womb to the grave. The yet healthy child hung upon the putrid breast of a dead mother; and the nuptial bed was changed into a sepulchre. . . . The hearses were but dead carts which continually traversed the streets, while the appalling cry 'bring out your dead' thrilled through every soul. Then it was that parents husbands, wives, and children, saw all that was dear to them thrown into a cart to be buried in one promiscuous heap." . . . The living were often seen hugging the bodies of their kindred that had not quite perished. Many laid violent hands upon themselves or upon each of them. Miscreant nurses and servants were attacked and carried off by the disease in the very act of their robbing or hastening the death of those who were committed to their care. Houses and streets were rendered tenfold more pestilential by the presence of the unburied dead.

Such is but a faint and imperfect description of the pestilence which now threatens Western Europe; the plague, of which Sir Thomas Watson says in one of his lectures, "I have never seen it, and hope I shall never see it." We hope so too, but if we take, as we purpose doing, a glance at the past history of this pestilence, we shall have reason to fear that it may yet re-visit these shores, robbed, though, it may be, of half the terror with which it was formerly regarded.

## THE HOSPITAL SUNDAY FUND IN DUBLIN.

The Report of the Committee of the Fund was issued last week, and we are gratified to find that the prosperity of the organisation is unimpaired. The progressive increase of the fund since its formation in 1874 is shown by the following figures:—

| | £ | s. | d. |
|---|---|---|---|
| 1874 . . | 3,306 | 3 | 2 |
| 1875 . . | 3,619 | 12 | 4 |
| 1876 . . | 3,873 | 9 | 3 |
| 1877 . . | 4,106 | 14 | 6 |
| 1878 . . | 4,300 | 18 | 11 |
| Total . | 19,206 | 18 | 2 |

Thus the Hospital Sunday movement in Dublin has been the means of obtaining a sum of upwards of £19,000 for the use of the sick poor, very little of which, the Council believe, would have reached the hospitals through any other channel.

The average amount received from the congregations which have been in connection with the movement from its commencement is as follows:—

| | £ | s. | d. |
|---|---|---|---|
| 1874 . . . | 19 | 6 | 1 |
| 1875 . . . | 19 | 15 | 7½ |
| 1876 . . . | 20 | 13 | 8 |
| 1877 . . . | 21 | 1 | 5½ |
| 1878 . . . | 22 | 17 | 11 |

The above proofs of increased support from both old and new friends is most gratifying to the Council, and must be equally so to those who supported the movement at its commencement.

The popularity of the Fund is, moreover, likely to increase, in consequence of a wise resolution arrived at by the Council to readjust the method of distribution, so that a fair share of the money may go to the hospitals which do the chief work of the city, and which are administered to the best advantage, which was not the case under the system hitherto existing. The Committee express the opinion that more value should be allowed for the work done by the hospitals, and they recommend that a committee be appointed to consider whether any and what change in the rules is desirable, by which the distribution should be made to depend to a greater extent than at present on the work done by the participating hospitals, as regards its extent, nature, and quality. The committee have considered a carefully prepared statement of the expenditure per bed, under each principal head, in each of the hospitals receiving aid from the fund. A study of this statement convinces the Committee that due care is not always exercised in the apportioning of the expenses between the different departments of the hospitals. In some cases the amount spent on the patients' provisions seem singularly small, while in others the cost of management if manifestly excessive.

In order that the incoming Council may have power to deal with this question, it has been necessary to modify Rule 9 by the omission of the words "for such contributions," so that the manner of estimating "work done" may be an open question to be decided by the Council for 1879.

The proposed reforms in the method of distribution are those which the *Medical Press* has advocated for several years past. They are those which are adopted in other cities, and which commend themselves to everyone's common sense, and we doubt not, if enacted, will inspire the public with confidence that the charity they contribute will be well applied. No doubt the managers of the rich, fashionable-influential hospitals will make an united effort to prevent the proposed reform being accomplished, but we should hope that the justice of the change will secure for it sufficient support to carry it through.

In the last report the Council had to regret a falling off in the subscriptions received by the participting hospitals. They are glad to be able to state that the subscriptions for 1877 exceed by upward of £1,000 those received in 1876, and by more than £500 those received in 1875.

While we thus commend in the strongest terms, both the work done and the suggestions made by the Committee of the Fund, we are obliged to take equally emphatic objection to the substance of their Report in relation to other matters. Pointing out, with great propriety, that no hospital should be entitled to a grant which had not lodged a statement of account of receipts and disbursements for three years—the Committee proceeds to say that in their opinion the existence of a second Orthopædic Hospital in Dublin is unnecessary, and believe that one of the two such institutions, which has now been established for three years, would, if gradually extended, meet all the requirements of the particular class of cases for which such institutions are intended. The Council be-

lieve the multiplication of hospitals, particularly "special" hospitals, is a great evil, calculated to waste resources and present efficiency, and therefore recommend that the the other Orthopædic Hospital should seek amalgamation with the more prosperous sister institution. It will be a matter for the consideration of the Council for 1879 whether it is justifiable for them to encourage the foundation of duplicate institutions by granting new establishments share of the funds at their disposal. The Council, while referring to this question, wish to point out that there are two ophthalmic hospitals doing exactly the same class of work receiving grants from the Fund. Although these hospitals have been a long time in existence, yet the Council think that for the reasons above stated they might be amalgamated, with benefit to the institutions, and certainly with advantage to the public.

It is quite open to us to question the accuracy of the statements herein made in depreciation of the special hospitals which the Committee advises shall be amalgamated out of existence. It is not, however, for us to draw such comparisons, and we are strongly of opinion that it is not for the Committee to do so either, for, we are convinced, it would greatly prejudice the success of the movement, if the Committee were to acquire a habit of belauding one institution at the expense of another, especially when the justice of the comparison is, by no means, obvious to the general public.

Moreover, we join issue with the Committee upon their proposition that one large special hospital is better than two smaller ones. It seems to us, on the contrary, the sick poor would suffer a serious loss if deprived of the advantages arising from the competition of institutions, and from a choice of surgical advisers, and we fail to see that any very important saving in hospital expenditure would arise from these amalgamations, for we know that the nurses, food, and medicine, which are necessary for a dozen patients in a small hospital will be just as necessary to them when transferred to a large one, and as there is, in such institutions, no paid staff of secretaries, registrars, and matrons, the only item of outlay which would be saved by amalgamation would be the actual house rent of the institutions.

We fully recognise the right of the Hospital Sunday Council to inquire into, and form opinions upon, all matters which have to do with the appropriation of the charity grant made by them from the Fund. Their special function is to distribute that money to the best advantage for the sick poor, and they are fully entitled to make every inquiry bearing on this duty, but the general administration of Dublin hospitals is not within their scope, and they would not, in our opinion, be justified in refusing aid to any hospital upon their idea that such hospital could be better worked in conjunction with some other institution, or in some other way, so long as that hospital does its duty *bonâ fide* towards the sick poor and faithfully expends the grant for their benefit.

It would be as reasonable that the Council should refuse money to all special hospitals on the ground that their work could be better done in the special department of a general hospital, as to withhold the public charity from one such institution because it objects to be extinguished by amalgamation.

Finally, we have to repeat our opinion, already more than once expressed, that the Council has but one function to fulfil, *i.e.*, to act as almoner for the general public, to spend the money entrusted to it for charitable uses for "the greatest good of the greatest number of sick poor," and this duty there is only one way of discharging, *i.e.*, by giving the public charity to those hospitals which treat the greatest number of deserving patients at the least cost consistently with efficiency. All speculations in hospital management outside this are, we think, *ultra vires*.

# Notes on Current Topics.

## The Plague in Russia.

In some respects the later official reports of the progress of the plague in Russia are more favourable. An official telegram from Astrachan confirms the news that on the 30th ult. there was no case of illness from the plague in Wetlianka or the neighbourhood. It has also ceased in one or two villages on the left bank of the Volga, and where several cases, all of them fatal, had occurred. It is, however, reported that the disease has made its appearance at Saratoff, notwithstanding the authorities of that district had drawn a cordon of isolation against Astrachan. Moreover, from Trieste we learn that a disease which has been diagnosed as spotted typhus, and in one case as metastasis bubonica, has broken out in the village of Sanikowa, near Xanthi, in Thessaly. The sanitary authorities have declared this outbreak to be very probably identical with the Eastern plague. In the meantime, all kinds of precautions are being taken to prevent the spread of the disease. Instructions have been issued by the Russian Government for the burning of the village of Wetlianka and other infected villages. The Austrian and Hungarian Governments have agreed to adopt protective measures on a large scale on the Bessarabian and Transylvanian frontiers. It is announced that vessels arriving at Constantinople from Russian and Roumelian Black Sea ports, will be subject to twenty-four hours quarantine for inspection; while the Council of Public Health at Madrid have decided to adopt similar precautions with respect to vessels arriving in Spanish ports. Nor is France altogether indifferent with regard to the possible extension of the pestilence, and an official note has just been published to the effect that the French Government intends taking part in the investigations being made in the infected districts, and in the efforts now proceeding for combating the disease.

Here we may notice the report of the Imperial German Sanitary Department respecting the origin and spread of the plague in Astrachan. There is no doubt that this disease in question is the true Asiatic plague, and that the epidemic is probably identical with that which devastated Germany in the fourteenth century under the name of the "Black Death." Probably, says the report, the outbreak in the above district could be traced to what has always been the principal cradle of the epidemic, viz., in the north-western angle of the Persian Empire.

There, in the highlands of Aderbeidschan, which extend from Mount Ararat to a point south of Lake Schari, the plague, after having apparently disappeared from the region for a space of twenty-eight years, has, since 1863, shown itself in repeated outbreaks. These outbreaks occurred in the years 1863, 1864, 1870, 1871, 1873, 1874, 1876, and 1877, and were intimately connected with the similar outbreaks in the Lower Euphrates Valley, near Bagdad, in the years 1867, 1868, 1873, 1874, and in 1877. The traffic between the Shiites, who live in North-Western Persia and the localities of Kerbela, and Nedchef in the Euphrates Valley, which contain their "holy things," and in particular the custom of those Mahometan sects to carry the bodies of their deceased relatives from time to time by means of caravans from Persia to those holy places for the purpose of being buried, appear to stand in causal connection with the repeated succession of outbreaks of epidemic in those two regions. Travellers in those parts describe the meeting of such caravans of dead bodies as producing effects of the most revolting description that can be imagined; and this religious usage is regarded as one of the chief means of carrying the plague from one of those regions to another, unless, indeed, it be not itself the source and origin of the disease.

In 1877 the epidemic advancing eastwards, reached the province of Ghilan, on the Caspian Sea, the chief town of which, Rescht, suffered a severe visitation of the pestilence. From that place there is considerable traffic carried on with the Government of Astrachan, as well as with the inhabitants of the Eastern Caucasus. Hence it is not surprising that cases of the disease were observed as early as May, 1877, and repeatedly since then in various spots in the south of Astrachan, some of which closely resembled those which occurred in Wetlianka.

From the latest reports received since writing the above it appears that there has been no fresh case of plague in the government of Astrachan since the 8th inst. But in Selitreune, which is within the quarantine district, there have occurred several fresh cases of plague, which proved fatal. The Government of Athens has ordered twenty-one days of quarantine against all vessels arriving from the Sea of Azoff, the Black Sea, &c. On the 9th inst. quarantine was established at Malta on all arrivals from Turkish and Greek ports.

## The Registrar-General's Quarterly Return.

In this report it is stated that in England the marriages were below the average in the third quarter of 1878, and that they have gradually declined in number since 1872. In the quarter just specified they were fewer than in any quarter on record in the preceding ten years. This certainly does not say much for the increasing prosperity of the working classes. Probably, the great depression in trade, the numerous strikes, and the falling off in certain manufacturing industries, will account for this gradual decrease in the marriage rate.

During the last three months of 1878 the deaths were equal to an annual rate of 22·6 per 1,000 of the population, which is not very high, considering the severity of the weather. In fact, the cold was not so fatal last quarter as it was in the corresponding periods of 1871 and 1874, when the death rates were 23·4 and 23·8 respectively. The increase of mortality was greater in the country than in town, and among the female than among the male portion of the population. The cold, moreover, did not affect children and adults so much as elderly people. In the provinces the death-rate varied from 17·0 in Huntingdon and Dorset to 29·0 in Lancashire. The Registrar-General calls especial attention to the great infant mortality and the excessive prevalence of zymotic disease in Lancashire, as well as to the increased fatality of enteric fever in Portsmouth, Shrewsbury, and other places. He still has to record a large per centage (5·0) of uncertified causes of death; and says it is to be regretted that no means exist for ascertaining how far this is due to the deaths of persons without any medical attendance, to unqualified medical practice, and the employment of unqualified assistants.

## Syphilis and Marriage.

THERE are few medical practitioners who have not been more than once asked by a patient who has contracted syphilis whether he ought to marry. The question is such a difficult one to answer, and casts such grave responsibility upon the physician, that we are surprised that it has not received more consideration than it has from writers on this disease. In some works and treatises on syphilis, the circumstances under which a patient may or may not safely marry receive little or no notice, so that had the practitioner to rely upon the information to be gathered from lectures and from books, he would have little to guide him in answering such an important question. Fortunately, common sense and a general knowledge of the pathology and sequelæ of syphilis will generally prevent him committing any grave mistake. Nevertheless, we cannot too forcibly impress upon the profession the fact that the study of this disease in relation to marriage has been grievously neglected, and that our information on the subject is by no means so full and exact as it might be. It was, therefore, a happy thought of Dr. Alfred Fournier, of the Hôpital St. Louis, Paris, when he made this question the subject of a clinical lecture, a short abstract of which will be found in the *Philadelphia Medical Times* for Jan. 4, 1879.

What the result may be if an affirmative answer is given to this question we need scarcely remind the reader. But the result of the inquirer being told that he must not marry should also be borne in mind. For then he is constrained to lead a life of celibacy, with all the irregularities and temptations to which such a life is exposed, and to be deprived of all that is dear in the idea of a family. Syphilis is not always an insurmountable obstacle to marriage. "I have," says Dr. Fournier, "known fifty-one instances in which the disease has been communicated to neither wife nor children." To the question as to when and under what conditions is marriage morally permissible to one who has contracted syphilis, Dr. Fournier replies: 1. Absence of actual manifestation. 2. Advanced age of the disease. 3. A period of immunity since the last outbreak. 4. A non-menacing character of the disease. 5. Adequate specific treatment. With regard to the second condition, he remarks that the minimum time since infection should be three or four years. Before the lapse of

three years he would not permit it, as he has seen the saddest results follow such a course. Later the probabilities are better, and with the exercise of proper care the dangers are not great. The fourth condition is an important consideration. When syphilis yields rapidly to treatment it is a favourable sign; and conversely if the form is grave and less tractable, it is more dangerous, and much greater caution should be used. Finally, an indispensable condition is adequate specific treatment. Syphilis, properly treated, rarely progresses to the tertiary stage. Treatment diminishes its contagiousness and hereditary transmissibility. Many cases could be cited where proper treatment for husband has put a stop to his wife's aborting, and where abortions consequent upon syphilis of both husband and wife have ceased, and healthy children have been born. On the whole, we think the opinions which Dr. Fournier has expressed on this important question will meet with the general approval of the profession; but our information on the subject would be much more complete than it is were surgeons who have had large experience in this complaint, to publish their views respecting this important question.

We shall be glad if medical men will send us reports of cases which have been under treatment either in which the wife or children have been infected with the disease, or have altogether escaped.

## A Warning to Medical Students.

A FEW days ago an inquest was held in Battersea upon the body of a medical student, and assistant to Dr. Tandy, who committed suicide by taking prussic acid. He had the character of being a steady man, but previous to the commission of the rash act he had stopped out late at night in bad company. In a letter to Dr. Tandy, he said, "It is all through the London drink and women. . . . I enclose the address of a public-house in Leicester Square where I passed the night, and where I pawned my watch and gold studs. . . . My two rings were bagged by some women. . . . I have determined to end my days by taking a dose of prussic acid." It is an unfortunate coincidence that such a case should have occurred at a time when the attention of the public has been drawn to the conduct of medical students. In this instance, however, the deceased is far more to be pitied than blamed. The intensity of his remorse and his despair, although they may be regarded as some proof of his insanity, show at the same time that he was by no means hardened to a life of profligacy. Such a case is a warning to all students who may feel inclined to give way to the temptations of a London life, as no one knows to what extent of dissipation he may go without incurring consequences that may not only damage his present reputation and his health, but be fatal to his future prospects.

## Small-pox Inoculation.—Vaccination Law Administrators.

THE Keighley guardians, who distinguished themselves as champions of vaccino-mania in England, are not without their imitators in Ireland. The Mountmelick guardians have, indeed, outstripped those intelligent and learned bucolics, for they have expressed their anxiety not only to neglect enforcement of the law and to discourage vaccination, but actually to aid in a breach of the law and in the dissemination of small-pox by inculcating the inoculation of that disease. At the last meeting of this model sanitary authority the following letter was read:—

THE VACCINATION LAWS.

"Local Government Board, Dublin,
24th January, 1879.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of minutes of the board of guardians of Mountmelick Union on the 18th inst., containing a resolution in the following terms:—

"'That this board think it would be a much greater benefit to humanity if the legislature would require all children to be inoculated for small-pox as of old.'

"In reference thereto the Local Government Board have to call the attention of the board to section 4 of the Act 31 and 32 Vic., cap. 87, which declares that any person who shall produce or attempt to produce in any person by inoculation with any variolus matter, or to any matter, article, or thing impregnated with variolus matter, or wilfully by any other means whatsoever, produce the disease of small-pox in any person, shall be guilty of an offence, and shall be liable to be proceeded against summarily before two or more justices of the peace in petty sessions assembled, and upon conviction to be imprisoned for any term not exceeding six months. In this manner Parliament has pronounced inoculation to be a most injurious practice, and prohibited it accordingly.

"This provision is rigorously enforced against offenders in Ireland, and it is to be regretted that the guardians of Mountmelick Union should, by such a resolution as that above referred to, possibly lead ignorant persons to violate the law.—By order, &c.

"B. BANKS, Secretary."

In reply to this letter a resolution was passed—"That we consider the Local Government Board's remarks outside the resolution, and incautiously written, as the guardians had no intention of doing what the Local Government Roard points out, but only asked the interference of the Legislature to consider whether it would not be *more judicious to pass a law in harmony with Nature and the laws of Providence.*"

Mr. Cobbe, in speaking to the resolution, said the Local Government Board wandered from the subject like old women taking a nightmare. They generally frightened every board of guardians in Ireland, but they could not this (the Mountmelick) board, because the board possessed too much common sense.

From such an example of ignorance and stupid obstinacy we may learn something of the material of the sanitary authorities in whose hands the execution of the Public Health Act in Ireland has been placed. To be consistent, the Mountmelick guardians ought to dismiss all their doctors, and engage in their place all the "wise women" and "seventh sons" they can find, with a stock of charms and hairs from the black cat's tail in lieu of medicines. Truly it is local government gone mad to place the execution of sanitary law in the hands of such persons.

## Pathological and Physiological Preparations for the Microscope.

WE have lately examined some histological microscopical preparations of both the normal and morbid organs and fissures (in man and the lower animals) made by Messrs. A. C. Cole & Son, of Oxford Gardens, Notting

Hill, and have been equally surprised and pleased with the extreme thinness and delicacy of the sections, as well as their extraordinary size, whilst the injecting and staining are alike admirable. The preparations are evidently made with a thorough knowledge of the subject, and are in all respects reliable. The list which we have examined shows that Messrs. Cole & Son have diligently and carefully studied their work, and have collected a very valuable stock of material, being thus enabled to supply both the student and the professor with a most comprehensive assortment of rare and valuable preparations. Messrs. Cole & Son have also submitted to our inspection a series of preparations which they have just produced specially for, and at the request of, Mr. Browning, the eminent microscopist, for use with his new "Lantern Microscope," by means of which the objects are projected upon a screen with the oxyhydrogen or electric light for the purpose of illustrating lectures and instructing classes, the details of structure, &c., being exhibited with extraordinary delicacy and an entire absence of either exaggeration or distortion. These specimens fully confirm the opinions recently expressed at the Pathological Society, being more delicate and larger than the many foreign specimens with which the English market has lately been deluged.

## The Flour and Plaster Case.

We are glad to see that the case is still going on against the now notorious vendors of the so-called "wheat meal." As Mr. Tillyard, who prosecuted, said, the question at issue is, did or did not the defendants represent the mixture as meal, and was the money advanced in the belief that it was so. That these representations were made, the evidence was overwhelming, and it is to be regretted that the medical officer of health did not from the first receive that support to which the able and conscientious discharge of his duties entitled him. From some of the judgments that have been passed on the matter, it would seem that the more flagrant the imposition and adulteration, the less likely it is to come within reach of the law. However, it is satisfactory to know that it is the intention of the Lord Mayor to commit the defendants for trial. There can be no doubt the case is one of great public importance, and there is no telling what might have been the result had the stuff been sold to the public.

The rates of mortality in the principal foreign cities, according to the most recent weekly returns were in Calcutta 50, Bombay 39; Paris 29; Geneva 19; Brussels 31; Amsterdam 23, Rotterdam, 27, The Hague 31; Copenhagen 25; Stockholm 21; Christiania 17; St. Petersburgh 48; Hamburg 30, Dresden 30, Breslau 31, Munich 28; Vienna 30, Buda-Pesth 39; Turin 29, Venice 32; Alexandria 43; New York 24, Brooklyn 22, Philadelphia 21, and Baltimore 23, per 1,000 of the various populations. Small-pox caused 13 deaths in Vienna, and 18 in Buda-Pesth. Enteric and simple continued fever caused 142 deaths in Calcutta.

Scarlet fever is still very prevalent in Salford, Birmingham, and Newcastle-upon-Tyne. The deaths last week from whooping-cough were proportionally most numerous in Hull, Manchester, Sheffield, and Leeds; and enteric fever in Newcastle, Leicester, and Salford. Small-pox caused 28 more deaths in London, and 21 in Dublin, whereas no death was referred to this disease in any of the other large provincial towns. There were 541 deaths in London from diseases of the respiratory organs, which is 115 above the weekly average of the last ten years.

The mortality last week in the principal cities and large towns of the United Kingdom was—Plymouth 17, Portsmouth 19, Leicester 19, Bradford 20, Bristol 20, Brighton 21, Wolverhampton 22, Norwich 23, Sunderland 24, Leeds 25, Sheffield 25, Edinburgh 25, London 26, Oldham 27, Birmingham 27, Salford 28, Glasgow 29, Newcastle-on-Tyne 29, Nottingham 29, Hull 30, Manchester 35, Liverpool 36, and the highest rate Dublin, 49 per 1,000 of the population.

At the meeting of the Metropolitan Asylums Board on Saturday last the report of the Committee for Stockwell Hospitals was resumed, when the erection in the grounds of the Fever Hospital of an additional pavilion for the accommodation of typhus fever cases at an estimated cost of £6,000 was decided upon.

# Scotland.

Edinburgh University Court.—The Edinburgh University Court met on the 31st ult., the Marquis of Hartington, Rector, in the chair. There were present, Principal Sir Alexander Grant, Bart., Lord Curriehill, the Lord Provost, Mr. Clark, Lord Young, the Rev. Dr. Lindsay Alexander, and Professor Campbell Fraser. It was reported that there were no registration appeals in connection with the register of the General Council for 1879. Isaac Bailey Balfour, M.B., D.Sc., was appointed additional examiner in botany for the current year. The office may be held for five years by annual re-appointment. B. M. Braidwood, M.D., Birkenhead, was appointed additional examiner in medical jurisprudence for the current year. This office may also be held for five years by annual reappointment. The additional examiners in natural history, anatomy, physiology, surgery, pathology, materia medica, midwifery, practice of medicine, clinical surgery, and clinical medicine, were re-appointed for the current year. A letter from Professor Balfour was submitted requesting that Dr. Hugh Cleghorn should be allowed to act as his substitute as examiner in botany during the current year. The matter was remitted to the senators to be proceeded with as usual, under the regulations on the subject of the absence of examiners.

Glasgow Death Rate.—At the usual fortnightly meeting of the Glasgow Town Council, held on the 3rd inst., Dr. Russell, the medical officer of health, submitted his report, from which it would appear that during the fortnight ending 25th January, there were 602 deaths registered, as compared with 629 in the preceding fortnight, representing a death-rate of 28 (27·6) per 1,000 living in place of 29 (28·7). The number of deaths of persons below 1 year was 97 in place of 122; and of persons aged 60 years and upwards, 119 in place of 121, as compared with the preceding fortnight. The

number of deaths from pulmonary diseases was 224, as compared with 280, representing a death-rate of 11 in place of 12½ per 1,000 living, and constituting 40 per cent. in place of 44 per cent. of the total deaths. The number of deaths from fever was 7 in place of 8, viz., 5 from enteric fever, 1 from typhus, and 1 undefined. The deaths from infectious diseases of children were 44 in place of 52, viz., 21 from whooping-cough, 13 from measles, and 10 from scarlet fever. The number of cases of fever registered was 29 in place of 38, viz., 21 enteric fever, 5 typhus, and 3 undefined. In addition to these, 159 cases of measles, 62 scarlet fever, 56 whooping-cough, and 20 of diphth ria, were the occasion of sanitary supervision and assistance as to disinfection and other preventive measures. There had been an outbreak of scarlet fever at Mossbank Industrial School. Between 16th December and 18th January there were removed from it to Belvidere 16 cases. The medical officer learned that scarlet fever was present in a dairy farm within the jurisdiction of the Abbey Parish of Paisley, and from which milk was sent into Glasgow. On inspection the arrangements were such as to afford abundant risk of contamination. This supply was at once stopped. Scarlet fever had been present in the farmer's family since the 24th ult.

Perth Infirmary.—A meeting of the contributors to the Perth Infirmary was held on the 4th inst., when the report, which was adopted, showed that there had been 527 cases treated within the house, 754 in the dispensary department, and 396 in the district—total 1,677, being an increase of 263 as compared with last year. The ordinary income for the past year amounted to £1,087 16s. 11d., and the expenditure to £2,512 4s. 8d., showing a deficiency of £704 7s. 9d. The deficiency in 1877 was £394 0s. 10d.

Royal Society of Edinburgh.—At a meeting of the Royal Society of Edinburgh held on the 3rd inst., Professor Heddle, St. Andrews, was presented with the Keith Medal for the biennial period of 1875-77 for papers he had communicated. The prize consists of a gold medal and fifty sovereigns, and Professor Kelland in presenting it said that Professor Heddle had the reputation of upholding the mineralogical fame of his native country. Professor Heddle afterwards read a paper on a new mineral species he proposed naming "Haughtonite" found in Aberdeenshire.

Death of Dr. MacRobin, Aberdeen.—Dr. MacRobin, Emeritus Professor of Medicine, died at his residence, Aberdeen, on the 4th inst., at the advanced age of 74. He was born in Edinburgh in 1804, received his education at the High School and University there, and went to Aberdeen in 1830, having been appointed Resident Physician to the Royal Lunatic Asylum. In 1839 Dr. MacRobin was appointed to the Chair of Medicine at Aberdeen University, and for fifteen year held the post of Dean of Faculty. He retired from the active duties of his professorship in 1875, and has since lived in comparative retirement.

The Health of Edinburgh.—At a public meeting of the Health Committee held on the 4th inst., at Edinburgh, Dr. Littlejohn submitted reports as to the health of the city during the month of December for the last quarter of the year, and for the whole period of 1878. The death-rate for December was stated at 22·43, for the quarter 19·76, and for the year as low as 21·53. From a statement distributipg the deaths throughout the city it was shown that the number of deaths which occurred during the year in the new town was 1,512, and in the old town 2,770, and in the southern suburbs 391. The rate of mortality for each of these districts was as follows—new town 1,853, old town 2,466, and the southern suburbs 1,690. The chief diseases of the infectious class during the whole year were measles and whooping-cough, both of which existed in an epidemic form 211 deaths having been caused by the former and 202 by the latter.

Registrar-General's Return.—The weekly return of the Registrar-General says: "The death-rate in the eight principal towns during the week ending with Saturday the 1st Feb., 1879 was 28·8 per 1,000 of estimated population. This rate is 3·3 per 1,000 above that of the corresponding week of 1878, and 0·5 per 1,000 above that recorded for the fourth week of 1879. The death-rate from the seven most familiar zymotic diseases was 3·5 per 1,000. Whooping-cough was the most fatal zymotic disease, and prevailed chiefly in Greenock, Dundee, and Glasgow. The deaths from inflammatory diseases of the lungs were more numerous by 34 than in the previous week, and exceeded by 92 the number of deaths from similar causes registered during the fifth week of 1878. The mean temperature of the week was 31°4, being 2°9 higher than that of the week immediately preceding, and 3°9 lower than that of the fifth week of 1878.

Glasgow Medico-Chirurgical Society.—At a meeting of this Society held in the Faculty Hall, St. Vincent Street, on Friday, the 7th inst., Professor Macleod read a paper on "Ice Accidents." The accidents referred to were, of course, fractures, of which Dr. Macleod took up only two, viz., Collis's and Potts's. The method in which the fracture is produced in each case was entered upon, and the treatment. With respect to Collis's fracture, Dr. Macleod suggested that it should be so set that movements of the fingers may be begun immediately after the accident, and Potts's in a jointed non-plastic splint, with movement of the ankle-joint at the end of first week. Some discussion followed.

Glasgow Philosophical Society.—At a meeting of this Society held on the 4th inst. Mr. W. J. Fleming read a paper on "The Physiological Effects of the Turkish Bath." This is understood to have been a life study on the part of Mr. Fleming. The Philosophical Society of Glasgow is composed mainly of the most respectable tradesmen of the city, and has become a favourite arena for medical prelection—much more so than the Medico-Chirurgical Society. If its members are not often enlightened—for very abstruse papers are read—they are not infrequently amused by "the doctors" and their generic and proverbial differences. The range of subjects is indeed wide—the potato disease and the Turkish Bath.

Glasgow Medical Journal.—The February number of this journal is not of so startling a nature as the one immediately preceding. Dr. Patterson contributes a very good paper on "A Few Surgical Cases;" Mr. McVail, his introductory address at Anderson's College "on Anderson's College; its Founder, &c." which is like a good many other introductory addresses, verbose and laudatory, without stint; interesting it may be to those concerned, but not quite suited to a medical journal. Most of the other matter is unimportant.

# Correspondence.

## DR. McCALL ANDERSON ON ADDISON'S DISEASE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In the *Medical Press and Circular* of the 5th inst., Department for Scotland, your correspondent has unintentionally misrepresented my views in two particulars.

For the first of these I am probably myself to blame, as I now see that the heading of the paper might bear the interpretation which you seem to put upon it; but as you have intimated your intention of publishing it in your columns, your readers will have an opportunity of seeing that I do not suppose that there is any

connection between Addison's disease as a whole, and the other two maladies mentioned, but simply that there seems to be some affinity between *the discolouration of the skin* in Addison's disease, on the one hand, and the symptoms of alopecia areata, and vitiligo, on the other, in so far as they all appear to be expressions of perverted innervation of the sympathetic nerve.

For the second of these, which is contained in the following paragraph, and which very likely is a misprint, I am in no way responsible. "Dr. Anderson thought that Dr. Renton's suggestion in regard to operative interference, would be likely to be of service if the opinion is correct that the semi lunar ganglia and solar plexus are involved in Addison's disease." If you insert between "would" and "be" the word "*not*," you will have a correct version of what I actually did say at the discussion which followed the reading of the paper, and which, probably, is in harmony with your own opinions.

I am, Sir,

Yours faithfully,

McCall Anderson.

Glasgow, Feb. 6th, 1879.

*** We regret that owing to great pressure on our space, we have been unable to present our readers with Dr. Anderson's paper 'ere this. Space will be reserved for it in our next.—Ed. M. P. & C.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Having observed in your issue of February 5th, the remarks of your Northern correspondent on my suggestion with reference to removal of the supra-renal capsules in Addison's disease, I beg to call his attention to the following facts at the November meeting of the Medico-Chirurgical Society of this city. I suggested "that if it was the case that the primary cause of Addison's disease was a peculiar degeneration of the supra-renal capsules, and if ordinary treatment were ineffectual, the capsules might be removed antiseptically. Although Dr. Brown-Séquard had removed both capsules from a rabbit with a rapidly fatal result, and one capsule in another rabbit which survived three days, still anatomically, the connections of the capsules were not such as to render their removal necessarily fatal."

With reference to this anatomical statement, "I am borne out by Professor Cleland."

Dr. McCall Anderson, in referring to my proposal, said "that it was little likely," not as your correspondent has it, "likely," to be of service if the semi-lunar ganglia and solar plexus were involved in the disease.

We are scientific enough in Glasgow to leave excision of the above ganglia to your Northern correspondent, and I would suggest, for his benefit, that in future he should make himself accurately acquainted with the facts of any discussion before he exercises his powers as a critic over them.

Yours, &c.,

J. Crawford Renton, M.B. Ed.

Glasgow, Feb. 7th, 1879.

## POOR-LAW MEDICAL SUPERANNUATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have seen, by the public papers, that on the motion of Mr. Patrick Martin, M.P., a return has been printed of the number of Poor-law officers in Ireland who have resigned since the passing of the Superannuation Act with the pensions assigned (where any were allowed) by the guardians. Anyone reading the Report, will be at once struck with the almost entire uselessness of the Act as it at present stands; indeed, I do not think the medical officers, generally, can expect to benefit by it, seeing that they are altogether at the mercy of the guardians who, as a rule (I should be sorry to include all—there are many exceptions), are far from generous, and have extremely little consideration. If a man has local influence, he may succeed in obtaining a fair and reasonable pension; but if he is not fortunate enough to have that, he must either work on as long as he is able, or resign, and if he does the latter, and has no private means, as is too often the case, he is forced to spend the last of his days in penury. It is stated that at present there are two dispensary doctors, each aged 76, clinging to office who, no doubt, would be glad to resign, if allowed a pension after their many years' labour. How can these old gentlemen perform their duties? It could not be expected that they would have physical strength to do so. How could they travel five or six miles, getting out of their beds in a cold wet night to attend a poor woman in labour, and perhaps be obliged to sit up with her in some miserable cabin for hours? I knew a case in the wealthy North of Ireland, where a doctor, after above 26 years' service succeeded, after much difficulty and strong opposition, in getting the *liberal sum* of £20 per annum. Before resigning he suffered from paralysis, and survived only a few months' after to enjoy the small pittance allowed him. His illness had been slow in its progress, and for a long period previous to his resigning he was perfectly unable to perform his duties efficiently. In this case, how then must the patients have suffered in the district, owing to the guardians having refused to grant superannuation? Probably from the same cause, the poor doctor's earthly end may have been hastened also.

In the printed returns already referred to, the cause of refusal of superannuation is stated to be owing in some cases to penuriousness, and in other cases it is insinuated that it may be attributed to want of local influence.

In neither of these can it be said for a moment that the provision of the Superannuation Act is fairly or justly administered. What I respectfully suggest, is this, that if any good is expected from the Sanitary Act, the Poor-law officers should be at liberty to resign after a certain number of years' service, or from bad health, and then be entitled to a certain pension, without the interference or control of Boards of Guardians. This appears to me to be the only *honest or fair plan;* indeed, it is just what is adopted *in all other services.* For years past, this result has been expected and hoped for, but as far as I can judge, it does not appear to be nearer than it was, nor am I aware that any exertion has been, or is being made, to bring it to a successful termination. The present seems a good time to make an effort, as the matter appears to engage public attention. I would, therefore, suggest that a meeting be called for all those interested, either at Belfast or Dublin, where the opinion of the profession may be obtained, as well as their best views of acting under the circumstances. A suitable petition might be drawn out, and certain resolutions passed.

If these ideas are approved of by the readers of the *Medical Press and Circular*, I hope some gentleman more able than I, will take the matter up, and give it his support.

I am, Sir,

Your obedient servant,

A Poor-law Medical Officer.

January 31st, 1879.

## MILK TRANSFUSION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Your issue of last Wednesday, contains a letter signed by Dr. Hercules McDonnell, of Dundalk. The tone of his letter would seem to convey—which I am sure he did not intend—that the information from which the paragraph to which he objects was written, was supplied by some of the medical men present at this operation. Such is not the fact.

I quite agree with him that such announcements would better suit a medical journal than the daily press; and acting on the opinion, I have refused all information in regard to the three operations of transfusion of milk I have had under my care, until I have them ready for publication in your journal.

Yours, &c.,

Austin Meldon

# Obituary.

## DR. B. F. McDOWELL, OF DUBLIN.

It is our painful duty to announce the death of Dr. Benjamin F. McDowell, Surgeon to Mercer's, and the Lock, Hospitals, Dublin, which took place at his residence in York Street, on Saturday last. Dr. McDowell had been for some months suffering from serious hepatic and gastro-intestinal derangements, and had been obliged to leave home in the hope of recovering his health. That hope was, unhappily, disappointed and his death, we

believe, arose eventually from that cause. Dr. McDowell was only 38 years of age, and his early death has caused profound feelings and expressions of sympathy from all who knew him. Deceased was a Licentiate of the College of Surgeons of fifteen years' standing, a Fellow in 1872; M.B., University of Dublin, 1867, &c. He was a fellow or member of most of the medical societies, Professor of Materia Medica and Therapeutics in the Ledwich School of Medicine, and a valuable contributor to this journal.

## MR. JOHN EVANS, M.B. LOND., OF SUNDERLAND.

We regret to have to record the sudden death of this gentleman. Deceased had been unwell for some days, but was not incapacitated from his duties, and attended Durham Assizes a few days since to give evidence in the case of Kewan *v.* the North Eastern Railway Company. On Sunday week he left his bedroom at half-past seven o'clock, and went downstairs to the consulting room to attend to his practice. About an hour afterwards a servant entering the room found him lying on the floor and quite motionless. Dr. Abrath was sent for, who found on his arrival a few minutes later, that life was extinct. Death had been the result of heart disease. Mr. Evans, who was 59 years of age, was educated at University College, London, graduated as Bachelor of Medicine, London University, in 1844, and was a member of the Royal College of Surgeons, and a Licentiate of the Society of Apothecaries. Since 1844 he has practised in Sunderland, principally in the East end of the town, and was well-known and much respected by his professional brethren and the public. For about 35 years he has held the appointment of district medical officer for Sunderland Parish, where he made his influence felt as a sanitary reformer, and at a meeting of the board last week a vote of condolence was passed to his widow, amid the unanimous expressions of regret for the loss the district had sustained.

**Indian Medical Service.**—List of candidates for commissions as Surgeons in Her Majesty's Indian Medical Service who were successful at both the London and Netley Examinations, February, 1879.

*† 1. T. H. Sweeney
** 2. D. F. Barry
3. G. F. A. Harris
4. J. Anderson
5. C. J. Bamber
6. M. O'Dwyer

* Gained the Parkes Memorial Bronze Medal.

**The Vacant Seat on the Council of the Irish College of Surgeons.**—We understand that Dr. Brunker, late Surgeon to the County Louth Infirmary and County Gaol, and also the representative of the Association of the County Infirmary Surgeons of Ireland, will present himself as a candidate for the seat on the Council of the Royal College of Surgeons in Ireland, vacated by the death of the late Dr. McDowell. Dr. Brunker is now resident in Dublin.

## NOTICES TO CORRESPONDENTS.

Dr. G. de Gorrequer Griffith.—"Puerperal Fever and Puerperal Scarlatina" received.

Dr. Norman Kerr.—"On the Mortality from Intemperate Drinking and how best to arrive at the Truth" received

Royal College of Surgeons of England.—On Friday, Feb. 14, at 3 p.m., Hunterian Oration, by Prof. Humphry.

Received without name, a batch of 17 foolscap folios of MS., being the "Report for 1878 of a Medical Officer of Health," evidently intended for presentation to the rural sanitary authority of Stroud. The sender has probably enclosed the wrong matter in our envelope, in which case the authorities on the other side will be at a loss to understand the purport of their enclosure. We shall be happy to exchange MS. on receipt of name and address.

Dr. M. C. A.—Alterations have been made as suggested; you will see proof before insertion.

Dr. J. C. C.—Don't quite see the force of your logic; however *Comme vous voulez*.

Mr. Hay is thanked for the local paper; we are glad the subject is attracting so much attention.

Dr. Paterson.—We shall be most happy.

Clinical Society of London.—Friday, Feb. 14, at 8.30 p.m., Dr. Ord "Rheumatoid Arthritis regarded from a Clinical point of view."—Dr Skerritt (Bristol), "Complete Obstruction of Intestine by Fibrinou Exudation."—Mr. Marsh, "A Case of Intestinal Obstruction in which the Abdominal Cavity was explored, a Stricture found, and the Gu successfully opened."—Mr. Bryant, "A Case of Acute Intestinal Ob struction; Laparotomy; Removal of large Impacted Gallstone fro the Ileum; Death from Peritonitis."—Mr. Lawson, "A Case of Su cessful Tracheotomy in the last stage of Diphtheria."—Dr. Dougla Powell will exhibit a Case of Leprosy with Enlarged Glands."

Dr. McNaughton Jones.—Will comme nce your translation of Löwen berg's papers as soon as Prof. Charcot's lectures are concluded.

### VACANCIES.

Ardwick and Ancoat's Dispensary, Manchester.—House Surgeon Salary, £100, with £20 from Provident Fund. Applications to th Hon. Sec. before Feb. 23.
Birmingham General Dispensary.—Resident Surgeon. Salary, £150 Applications to the Secretary on or before Feb. 19.
Donaghmore Union, Borris-in-Ossory Dispensary.—Medical Officer. Salary, £100, with fees, &c., and £20 as Sanitary Officer. Election Feb. 25.
Joint Hospital of Partick, Hillhead, &c.—House Surgeon. Salary £100, with board. Applications to the Secretary, 180 St. Vincen Street, Glasgow.
Leeds Union.—Assistant Medical Officer for the Workhouse. Salary £100, with board. Applications to the Clerk of the Guardians by Feb. 15.
Longford Union, Killashee Dispensary.—Medical Officer. Salary, £120 with fees, &c. Election, March 18.
Roscommon County Infirmary.—Apothecary and Registrar. Salary £60, with apartments and allowances. Election, Feb. 21.
Royal Albert Asylum for Idiots, Lancaster.—Assistant Medical Officer Salary commencing at £110, with board. Applications to Dr. Shut tleworth, at the Asylum before Feb. 18.

Buck, J. S., M.R.C.S.E., Junior Assistant Medical Officer to the Three Counties Lunatic Asylum, Arlesey, Beds.
Cooper, J., F.R.C.S.Ed., Medical Officer of Health for the Erpingham Rural Sanitary District.
Garrard, W. A., M.R.C.S.E., a Surgeon to the Rotherham Hospital and Dispensary.
Grindrod, J. A., M.R.C.S.E., Medical Officer of Health for the Norden Urban Sanitary District, Lancashire.
Jackson, Dr. J., Medical Officer and Medical Officer of Health for the Drum Dispensary District of the Cootehill Union, co. Cavan.
Jaquet, J. L., M.R.C.S., House Surgeon to the Rotherham Hospital.
Richmond, C. E., M.R.C.S.E., Resident Surgeon-Apothecary to the Warrington Infirmary and Dispensary.
Tatham, G. G., M.D., L.R.C.S.Ed., Medical Officer, &c., to the Wigan District of the Wigan Union and Workhouse.
Woodward, F. E., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Chester General Infirmary.

## Births.

Hamilton.—At 30 Northampton Park, Canonbury, the wife of Thos. Hamilton, M.B., F.R.C.S., of a son.
Stewart.—Feb. 2, at Glasslough, co. Monaghan, the wife of Robert W. Stewart, L.R.C.P.E., of a daughter.
Symes.—Feb. 4, at Ward's End, Halifax, Yorks, the wife of E. W Symes, M.D., of a daughter.

## Deaths.

Barker.—Feb. 2, at 83 Waterloo Road, Dublin, John Barker, M.D., F.R.C.S.I., aged 63.
Jessopp.—Jan. 12, at Braintree, John Jessopp, L.R.C.P.Ed., aged 44.
Lett.—Feb. 3, at 8 Rathmines Road, co. Dublin, Elizabeth Sarah, relict of the late Richard Lett, M.D., of Silverstone, Northamptonshire, and formerly of Bannow, co. Wexford.
Macrobin.—Feb. 4, at Aberdeen, John Macrobin, M.D., Emeritus Professor of Medicine in the Aberdeen University.
Morewood.—Feb. 4, at Draperstown, co. Derry, John Morewood, L.R.C.S.I.
O'Kelly.—Feb. 4, at Maynooth, co. Kildare, Edward Talbot O'Kelly, M.D., aged 68.
Porter.—Jan. 28, at Torquay, A. MacKay Porter, M.D., L.R.C.S.Ed., formerly of Belfast, aged 33.
Roberts.—Feb. 3, at 47 Queen Street, Edinburgh, Helen Ogilvy, wife of W. A. Roberts, M.D.
Wade.—Feb. 4, at Ryebank, Kilcock, co. Kildare, Nugent Wade, Surgeon A.M.D., aged 32.
White.—Jan. 28, at Blenheim Road, St. John's Wood, Charles John White, M.R.C.S.E., Surgeon-Major A.M.D. (on half-pay), aged 46.

# IRISH POOR-LAW INTELLIGENCE.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

(*Continued.*)

23. *Power to Compel Paving, &c., of private Streets.*

29. (*Verb.*) *Penalty on Unauthorised Building over Sewers and under Streets in Urban District.*—Any person who in any urban district, without the written consent of the urban authority—

(1) Causes any building to be newly erected over any sewer of the urban authority; or

(2) Causes any vault, arch, or cellar to be newly built or constructed under the carriageway of any street,

shall forfeit to the urban authority the sum of five pounds, and a further sum of forty shillings for every day during which the offence is continued after a written notice in this behalf from the urban authority; and the urban authority may cause any building, vault, arch, or cellar erected or constructed in contravention of this section to be altered, pulled down, or otherwise dealt with as they may think fit, and may recover in a summary manner any expenses incurred by them in so doing from the offender.

### Disposal of Sewage.

30. (*Abs*). *Powers for Disposing of Sewage.*—For the purpose of receiving, storing, disinfecting, distributing, or otherwise disposing of sewage, any sani-tary authority may,

(1) Construct works;

(2) Contract for the use of land, buildings, engines, materials, &c.

(3) Contract to supply any person with sewage.

31. *Power to agree for Communication of Sewers with Sewers of adjoining District.*

32. *Power to deal with Land appropriated to Sewage Purposes.*

33. *Contribution to Works under Agreement for Supply or Distribution of Sewage.*

34. (*Verb.*) *Application of 27 and 28 Vic., cap. 114.*—The making of works of distribution and service for the supply of sewage to lands for agricultural purposes shall be deemed an "improvement of land" authorised by the Improvement of Land Act, 1864, and the provisions of that Act shall apply accordingly.

### As to Sewage Works without District.

35. *Notice before commencing Sewage Works without District.*

36. *In case of Objection, not without Sanction of L.G.B.*

37. *Inspector to hold Inquiry and Report to L.G.B.*

### Regulation of Buildings.

38. (*Verb.*) *Power to Purchase Premises for Improvement of Streets.*—Any urban authority may purchase any premises for the purpose of widening, opening, enlarging, or otherwise improving any street, or (with the sanction for the L.G.B.) for the purpose of making any new street.

39. (*Verb.*) *Power to Regulate Line of Buildings.*—When any house or building situated in any street in an urban district, or the front thereof, has been taken down, in order to be rebuilt or altered, the urban authority may prescribe the line in which any house or building, or the front thereof, to be built or rebuilt in the same situation shall be erected, and such house or building, or the front thereof, shall be erected in accordance therewith.

The urban authority shall pay or tender compensation to the owner or other person immediately interested in such house or building for any loss or damage he may sustain in consequence of his house or building being set back or forward, the amount of such compensation, in case of dispute, to be settled by arbitration in manner provided by this Act.

40. (*Verb.*) *Buildings not to be brought forward.*—It shall not be lawful in any urban district, without the written consent of the urban authority, to bring forward any house or building forming part of any street or any part thereof, beyond the front wall of the house or building on either side thereof, nor to build any addition thereto beyond the front of the house or building on either side of the same.

41. *Power to make Byelaws respecting New Buildings, &c.*

42. *As to Commencement of Works and Removal of Works made contrary to Bye-laws.*

43. *What to be deemed a New Building.*

### Privies, Waterclosets, etc.

44. *Penalty on building Houses without Privy accommodation.*

45. (*Verb.*) *Power of Sanitary Authority to enforce provision of Privy accommodation for Houses.*—If a house within the district of a sanitary authority appears to such authority to be without sufficient watercloset, earthcloset, or privy accommodation, and a properly constructed ashpit, the sanitary authority shall, by written notice, require the owner or occupier of the house, within a reasonable time therein specified, to provide sufficient watercloset, earth-closet, or privy accommodation, and an ashpit constructed as aforesaid, or either of them, as the case may require.

If such notice is not complied with, the sanitary authority may, at the expiration of the time specified in the notice, do the work thereby required to be done, and may recover in a summary manner from the owner the expenses incurred by them in so doing, or may by order declare the same to be private improvement expenses: Provided that where a watercloset, earthcloset, or privy has been and is used in common by the inmates of two or more houses, or if in the opinion of the sanitary authority a watercloset, earthcloset, or privy may be so used, they need not require the same to be provided for each house.

46. (*Verb.*) *As to Earthclosets.*—Any enactment in force within the district of any sanitary authority requiring the construction of a watercloset shall be deemed to be satisfied by the construction, with the approval of the sanitary authority, of an earthcloset.

Any sanitary authority may, as respects any house in which any earthcloset is in use with their approval, dispense with the supply of water required by any contract or enactment to be furnished to any watercloset in such house, on such terms as may be agreed on between such authority and the person providing or required to provide such supply of water.

Any sanitary authority may themselves undertake, or contract with any person to undertake, a supply of dry earth or other deodorising substance to any house within their district for the purpose of any earthcloset.

In this Act the term "earthcloset" includes any place for the reception and deodorisation of fæcal matter constructed to the satisfaction of the sanitary authority.

47. *Other means of removing House Refuse.*

48. (*Verb.*) *Privy accommodation for Factories.*—Where it appears to any sanitary authority that any house is used or intended to be used as a factory or building in which persons of both sexes are employed or intended to be employed at one time in any manufacture, trade, or business, the sanitary authority may, if they think fit, by written notice, require the owner or occupier of such house, within the time therein specified, to construct a sufficient number of ashpits, and of waterclosets, earthclosets, or privies, for the separate use of each sex.

Any person who neglects or refuses to comply with any such notice shall be liable for each default to a penalty not exceeding twenty pounds, and to a further penalty not exceeding forty shillings for every day during which the default is continued.

49. (*Verb.*) *Public Necessaries.*—Any urban authority may, if they think fit, provide and maintain, in proper and convenient situations, urinals, waterclosets, earthclosets, privies, and ashpits, and other similar conveniences for public accommodation.

50. (*Verb.*) *Drains, Privies, &c., to be properly kept.*—Every sanitary authority shall provide that all drains, waterclosets, sinks, lavatories, gully traps, earthclosets, privies, ashpits, and cesspools within their district be constructed, trapped, covered, ventilated, and kept so as to not to be a nuisance or injurious to health.

51. (*Verb.*) *Examination of Drains, &c., on complaint of nuisance.*—On a written application of any person to a sanitary authority, stating that any drain, watercloset, earthcloset, privy, ashpit, or cesspool on or belonging to any premises within their district is a nuisance or injurious to health (but not otherwise), it shall be lawful for any sanitary officer duly authorised in writing in that behalf by such sanitary authority, after twenty-four hours written notice to the occupier of such premises, or in case of emergency without notice, to enter such premises, with or without assistants, and cause the ground to be opened, and examine such drain, watercloset, earthcloset, privy, ashpit, or cesspool. If the drain, watercloset, earthcloset, privy, ashpit, or cesspool on examination is found to be in proper condition, he shall cause the ground to be closed, and any damage done to be made good as soon as can be, and the expenses of the works shall be defrayed by the person making the above-mentioned written application. If the drain, watercloset, earthcloset, privy, ashpit, or cesspool on examination appear to be in bad condition, or to require alteration or amendment, the sanitary authority shall forthwith cause notice in writing to be given to the owner or occupier of the premises requiring him forthwith or within a reasonable time therein specified to do the necessary works; and if such notice is not complied with, the person to whom it is given shall be liable to a penalty not exceeding ten shillings for every day during which he continues to make default, and the sanitary authority may, if they think fit, execute such works, and may recover in a summary manner from the owner the expenses incurred by them in so doing, or may by order declare the same to be private improvement expenses, as well as the expenses incurred in the previous examination.

### Scavenging and Cleansing.

*Regulations as to Streets and Houses.*

52. (*Verb.*) *Sanitary Authority to provide for cleansing of Streets and removal of Refuse.*—Every sanitary authority may, and when required by order of the L. G. B. shall, themselves undertake or contract for—

The removal of house refuse from premises;

The cleansing of earthclosets, privies, ashpits, and cesspools;

either for the whole or any part of their district: Moreover, every urban authority and any rural authority invested by the L. G. B. with the requisite powers may, and when required by order of the said Board, shall themselves undertake or contract for the proper cleansing of streets, and may also themselves undertake or contract for the proper watering of streets for the whole or any part of their district.

All matters collected by the sanitary authority or contractor in pursuance of this section may be sold or otherwise disposed of, and any profits thus made by an urban authority shall be carried to the account of the fund or rate applicable by them for the general purposes of this Act; and any profits thus made by a rural authority in respect of any contributory place shall be carried to the account of the fund or rate out of which expenses incurred under this section by that authority in such contributory place are defrayed.

If any person removes or obstructs the sanitary authority or contractor in removing any matters by this section authorised to be removed by the sanitary authority, he shall for each offence be liable to a penalty not exceeding five pounds: Provided that the occupier of a house within the district shall not be liable to such penalty in respect of any such matters which are produced on his own premises and are intended to be removed for sale or for his own use, and are in the meantime kept so as not to be a nuisance.

53. (*Verb.*) *Penalty on neglect of Sanitary Authority to remove Refuse, &c.*—If a sanitary authority who have themselves undertaken or contracted for the removal of house refuse from premises, or the cleansing of earthclosets, privies, ashpits, and cesspools, fail, without reasonable excuse, after notice in writing, from the occupier of any house within their district requiring them to remove any house refuse, or to cleanse any earthcloset, privy, ashpit, or cesspool belonging to such house or used by the occupiers thereof, to cause the same to be removed or cleansed, as the case may be, within seven days, the sanitary authority shall be liable to pay to the occupier of such house a penalty not exceeding five shillings for every day during which such default continues after the expiration of the said period.

54. (*Verb.*) *Power of Sanitary Authority to make Byelaws imposing duty of Cleansing, &c., on Occupier.*—Where the sanitary authority do not themselves undertake or contract for—

The cleansing of footways and pavements adjoining any premises,

The removal of house refuse from any premises,

The cleansing of earthclosets, privies, ashpits, and cesspools belonging to any premises,

they may make byelaws imposing the duty of such cleansing or removal, at such intervals as they think fit, on the occupier of any such premises.

55. *Power to provide Receptacles for deposit of Rubbish.*

56. (*Verb.*) *Houses to be Purified, on certificate of Officer of Health or of two Medical Practitoners.*—Where, on the certificate of the medical officer of health or of any two medical practitioners, it appears to any sanitary authority that any house or part thereof is in such a filthy or unwholesome condition that the health of any person is affected or endangered thereby, or that the whitewashing, cleansing, or purifying of any house or part thereof would tend to prevent or check infectious disease, the sanitary authority shall give notice in writing to the owner or occupier of such house or part thereof to whitewash, cleanse, or purify the same, as the case may require.

If the person to whom notice is so given fails to comply therewith within the time therein specified, he shall be liable to a penalty not exceeding ten shillings for every day during which he continues to make default; and the sanitary authority shall cause such house or part thereof to be whitewashed, cleansed, or purified, and may recover in a summary manner the expenses incurred by them in so doing from the person in default.

57. (*Verb.*) *Penalty in respect of certain Nuisances on premises.*—Any person who in any sanitary district—

(1) Keeps any swine or pig stye in any dwelling-house, or so as to be a nuisance to any person; or

(2) Suffers any waste or stagnant water to remain in any cellar or place within any dwelling-house for twenty-four hours after written notice to him from the sanitary authority to remove the same; or

(3) Allows the contents of any watercloset, privy, or cesspool to overflow or soak therefrom,

shall, for every such offence be liable to a penalty not exceeding forty shillings, and to a further penalty not exceeding five shillings for every day during which the offence is continued, and the sanitary authority shall abate or cause to be abated every such nuisance, and may recover in a summary manner the expenses incurred by them in so doing from the occupier, or in the case of houses let to weekly or monthly tenants, or in separate apartments, from the owner of the premises in which the nuisance exists.

OFFENSIVE DITCHES AND COLLECTIONS OF MATTER.

58. *Provision for obtaining order for Cleansing offensive Ditches lying near or forming the boundaries of district.*

59. (*Verb.*) *Removal of filth on certificate of Inspector of Nuisances or Sanitary Officer.*—Where in any urban district it appears to the inspector of nuisances or sanitary officer that any accumulation of manure, dung, soil, or filth, or other offensive or noxious matter, ought to be removed, he shall give notice to the person to whom the same belongs, or to the occupier of the premises whereon it exists, to remove the same; and if such notice is not complied with within twenty-four hours from the service thereof, the manure, dung, soil, or filth, or matter referred to, shall be vested in and be sold or disposed of by the urban authority, and the proceeds thereof shall be applied in payment of the expenses incurred by them in the execution of this section; and the surplus (if any) shall be paid on demand to the owner of the matter removed.

The expenses of removal by the urban authority of any such accumulation, if and so far as they are not covered by the sale thereof, may be recovered by the urban authority in a summary manner from the person to whom the accumulation belongs or from the occupier of the premises, or (where there is no occupier) from the owner.

60. (*Verb.*) *Periodical Removal of Manure from Mews and other Premises.*—Notice may be given by any urban authority (by public announcement in the district or otherwise) for the periodical removal of manure or other refuse matter from mews, stables, or other premises; and where any such notice has been given, any person to whom the manure or other refuse matter belongs who fails so to remove the same, or permits a further accumulation, and does not continue such periodical removal at such intervals as the urban authority direct, shall be liable without further notice to a penalty not exceeding twenty shillings for each day during which such manure or other refuse matter is permitted to accumulate.

WATER SUPPLY.

*Powers of Sanitary Authority in Relation to Supply of Water.*

61. *General Powers for supplying District with Water.*

62. *Restriction on Construction of Waterworks by Sanitary Authority.*

63. *As to Construction of Reservoirs.*

64. *Power of Carrying Mains.*

65. (*Verb.*) *As to Supply of water.*—A sanitary authority shall provide and keep in any waterworks constructed or purchased by them a supply of pure and wholesome water; and where a sanitary authority lay any pipes for the supply of any of the inhabitants of their district, the water may be constantly laid on at such pressure as will carry the same to the top story of the highest dwelling-house within the district or part of the district supplied.

## WATERFORD GUARDIANS.

THE Clerk read the applications of Drs. Connolly and Arthur for the vacant position of physician to the workhouse.

Mr. Conn wanted to see the testimonials of the candidates.

Dr. Scott did not see the necessity for such a proceding at all. Testimonials were things which were easily got, and as to qualifications he believed the candidates were equal. He should disagree with Mr. Conn's proposal.

Mr. Fortescue—And both gentlemen have held situations under the board, and are therefore qualified.

Mr. Conn—In deference to the feeling of the guardians I will withdraw my proposition.

The Chairman—Then we will take a poll at once.

Mr. Conn—Oh! no. I have a few remarks to make on the subject first.

The Chairman—I think that in this case everything is so well understood that it is not necessary to have any speeches.

Mr. P. M. Barron—I propose Dr. Connolly for the position of medical officer of the workhouse.

Sir J. Paul, in seconding the proposition, hoped there was no one there who would accuse him of being bigoted, or of supporting a man merely because he was a Protestant, but if there were a Protestant and Catholic before them of equal merits, he did not see why he should not support one of his own persuasion.

Mr. Conn had nothing on earth to say against Dr. Connolly, who was a very meritorious young gentleman, and very anxious about the discharge of his professional duties, and when the governors of the Lunatic Asylum appointed him the visiting physician of that institution they paid a very high compliment to him and his family. That was followed by his being appointed to a dispensary in the city, the double compliment pronouncing that he was a highly favoured child of fortune. Now, however, it was proposed to give him a third appointment. (Cries of "No"). He had a £170 a year for one position, and £100 a year for another, and now it was proposed to give him another £100 a year, and there was not a word about his giving up the dispensary.

At this juncture Dr. Connolly, who had been called by some of the guardians, entered the board-room, and a regular uproar ensued.

Mr. Clampett—Doctor, is it your intention to resign? (Great confusion.)

Mr. Conn—Order! order! It is out of all order. This is interrupting the debate. I won't have it. (Confusion.)

Major O'Gorman—(who sat as if in "that accursed House of Commons," with his head covered, and brought his Parliamentary experience and privilege to bear on the question)—It is out of all order. I rise to a question of privilege. There is a stranger in the house. (Laughter.) It is out of order for an outsider to address the board.

Dr. Connolly then retired from the room.

Mr. Conn—Another interruption! You may get a sealed order rfom the Local Government Board to that effect, but what right have you to make an appointment depend on a bargain of that kind? There are 468 sick poor in this house, and only one other sick old man, and this young man—if you elect him—to attend to these 468, and can this young man attend to these 468 poor, with three situations on his hands? (Confusion.) Shout on! I appeal to Mr. Fortescue if I am wrong in making that statement.

Mr. Fortescue—If you appeal to me I must say you are. Dr. Connolly plainly says he will resign the dispensary if he gets this appointment.

Sir R. Paul—As he is not allowed to speak for himself, I, as his seconder, will go bail that he will resign the dispensary if elected to this situation.

Mr. Conn—Very well! I am only discharging my duty here, and will ask you are we to select the best medical man? (Interruption and great confusion.) I am speaking on the strict lines of legitimate discussion. (Disorder.] I have a right to ask the question, and I will maintain my right. Are we selecting the best man in electing a gentleman whose time is otherwise fully occupied, and who cannot give proper attention to his work? (Interruption, and cries of "Go on, Mr. Conn.") I am speaking at the top of my voice, and yet I can't be heard.

Dr. Scott seconded the nomination of Dr. Arthur. He would not have said a word that day, as he knew that every man in the room had gone there armed with a certain determination—(laughter)—but that what fell from Sir Robert Paul, whom he respected very much, had made it necessary for him to offer one or two observations on the subject under discussion. Sir Robert had alluded to Dr. Connolly's claims on the board and the citizens of Waterford through consideration of the members of his family who had gone before him; and he (Dr. Scott) would not dispute those claims; but he would ask the board to consider if that was a matter to influence them in their selection that day?—if, in fact, a man's ancestors could help him to heal an acute disease, or, as Mr. Conn would say, "to pluck a rooted sorrow from the mind!" In answer to the proposition that had been laid before them, he would ask them to remember the old adage, "Live and let live." (Hear, hear.)

Major O'Gorman believed that before Dr. Connolly became a candidate for the present vacancy he should have resigned the other appointment. If a member of Parliament wanted a situation he should resign his seat, (Cries of "Poll").

Captain Power—It is asked who is Dr. Connolly? (Great confusion; cries of "Not at all," and "We all know him.") Who was his grandfather? ("Some of us know him better than you.")

A poll was then taken, and Dr. Connolly was elected, the voting being:—For Dr. Connolly, 29; for Dr. Arthur, 22.

Dr. Connolly was then called before the board and informed of his election, for which he briefly returned thanks, and undertook to resign his dispensary appointment on Friday, which was the earliest date at which he could do so.

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING FEB. 1, 1879.

| | | |
|---|---|---|
| Total registered deaths in Dublin and suburbs* | | ... 296 |
| Ten years average of same week ... ... | | ... 188 |
| Excess of mortality above average ... ... | | ... 118 |
| 10 weeks' ratio of deaths Rathmines | 28·0 | per 1,000 |
| " " " Donnybrook† | 29·7 | " |
| " " " Blackrock | 15·1 | " |
| " " " Kingstown | 24·2 | " |
| " " Entire Dublin District | 48·9 | " |
| COMPARATIVE RATIOS—London ... | 26·2 | " |
| " " Glasgow ... | 29·3 | " |
| " " Edinburgh ... | 24·6 | " |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Deaths from diseases of the respiratory organs, which in the preceding five weeks had been respectively 96, 104, 100, 96, and 78, rose again last week to 97, of which 75 resulted from bronchitis, 10 from pneumonia, and 12 from lung disease unspecified. The deaths from these causes are more than double the average number (44) in the corresponding week of the last ten years, the average mean temperature of which was 9·5° Fahrenheit over the mean for last week.

Sixty-eight deaths from zymotic diseases were registered, being 6 more than in the preceding week, and 33 over the average number for the fifth week of the ten years 1869-78. They include 21 from small-pox, 15 from fever (3 typhus, 9 typhoid, and 1 simple continued fever), 9 from measles, 8 from scarlet fever—7 of which were children admitted into Cork-Street Hospital from the South Dublin Union Workhouse—4 from diphtheria, 3 each from whooping-cough and diarrhœa, 2 from croup, &c.

## LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF JANUARY, 1879.

JANUARY 6th.—Patton, William Johnstone, Farnham House, Finglas, co. Dublin; Lic. R. Coll. Surg. Irel. 1878.

8th.—Mason, John; 25 Cullenswood, Ranelagh, co. Dublin; Lic. R. Coll. Surg. Irel. 1878.

9th.—Deane. Freeman William; 15 Oxmantown Mall, Parsonstown, Kings County; M.B. 1878, and B.Ch. 1878 Univ. Dub.

16th.—Campbell, Arthur James; 4 Upper Sackville Street, Dublin; M.B. 1878 and B.Ch. 1878 Univ. Dub.

16th.—Carleton, Patrick Maurice; 4 Ardmoulin Place, Belfast; M.D. 1877 and M.Ch. 1878 Q. Univ. Irel.

17th.—Battersby, Henry Lewis; 51 Upper Rathmines, co. Dublin; Lic. R. Coll. Surg. Irel. 1878.

21st.—Reddy, Bernard; Castlelost, Westmeath; Lic. R. Coll. Surg. Irel. 1878.

21st.—Flood, Edmund James; Danesfort, Blacklion, co. Cavan; Lic. R. Coll. Surg. Irel. 1878, Lic. R. Coll. Phys. Edin. 1879.

22nd.—MacMunn, John Robert; Seafield House, Dromore West, co. Sligo; Lic. R. Coll. Surg. Irel. 1878.

23rd.—Westby, Ashley John; 21 Trafalgar Terrace, Monkstown, co. Dublin; M.B. 1878, Bach. Surg. 1878 and Mast. Surg. 1878 Univ. Dub.

29th.—O'Shaughnessy, Patrick James Barry; Charleville, co. Cork; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K.Q. Coll. Phys. Irel.

### LECTURE II.

### BRONCHIAL CONGESTION, AND THE PATHOLOGICAL RELATIONS OF ASTHMA.

By JOHN C. THOROWGOOD, M.D., F.R.C.P.,

Physician to Victoria Park Hospital for Diseases of the Chest, and to the West London Hospital.

(*Continued from page* 80.)

In my last lecture I placed before you the most prominent theories that have been advanced in explanation of the phenomena attendant on a fit of spasmodic bronchial asthma. I sought to make clear, from experimental and clinical evidence, the reasons that support my belief in the neurotic or spasmodic nature of the breath stoppage; and then I discussed the question of the seat of this spasm, showing that most of those, who, for the last century, have given their attention to asthma, believe the spasm mainly to affect the smooth muscular coat of the bronchial tubes. The part taken by the diaphragm in the mechanism of asthma was also considered, and I endeavoured to prove that the condition of this important muscular structure during a fit of asthma, with respect to elevation or depression, is not a constant one, but sometimes it may be elevated, sometimes depressed, according to the nature and rhythm of the respiratory effort. The cases where the diaphragm is raised, and the epigastrium retracted, appeared to be most common in young persons, and in hysterical subjects, where inspiratory dyspnœa was marked, where no great degree of emphysema was developed, and where the asthma was often excited by some powerful expiratory effort, as, for example, a great fit of coughing or laughing. The cases where the abdomen protruded, and the diaphragm was depressed, were usually those of persons who had more or less emphysema of lung, whose chests were over-filled with air, and whose respiratory difficulty was rather in expiration than in inspiration. In the recognition of these features, I looked to find some explanation of the contradictory statements of many authorities as to the condition of the thorax and lungs during a fit of asthma. How far I have succeeded in establishing the truth of what I have advanced, I will not stay to inquire; but I think we must all agree that the subject is one on which, in our present state of knowledge, some difference of opinion must be allowed, and we must not expect the term, asthma, to comprehend a complete uniform train of symptoms. No wonder, when we reflect on the complex nature of the respiratory process, and the various forces and conditions involved in its performance.

We now pass from the nervous and muscular elements of the asthmatic fit to enter more fully on the vascular element: on congestion of the air tubes as a producer of severe dyspnœa. I have already put before you the theory, very lately propounded by Weber, in the form of a supposition of tumefaction of the mucous membrane of the bronchi in consequence of dilatation of the blood vessels through vaso-motor nervous influence. This idea of rapid congestion causing serious dyspnœa does not lack support. There are those who appear to regard it as the exclusive cause of asthma—at least, so I judge from some of the statements I find put forth by writers. Professor Sée, of Paris, for example, in a very interesting paper in the *Practitioner*, on the "Use of Belladonna in Asthma," concludes with these words: "We need not concern ourselves with the bronchial muscles, as it is well understood at the present day (1869) that they play no part in the production of asthma." The last time I ever saw Dr. Hyde Salter smile was when I read to him these remarkable words of the French professor; but Salter said he was aware a similar opinion had been expressed by others who had spoken in a way yet more emphatic,

(a) Delivered before the Medical Society of London. Erasmus Wilson, F.R.S., President in the Chair.

and by no means complimentary to the upholders of the doctrine of bronchial spasm.

Weber, who appears the original propounder of this bronchial congestion theory, is far from denying bronchial spasm as a factor in the asthmatic fit; and Biermer, whose rational and clear views it is a pleasure and satisfaction to study, attributes a certain *rôle* to the fluxionary element in bronchial asthma, while he also supports the doctrine of tonic bronchial spasm.

In old days we know that a distinction was drawn between dry and humoral asthma; and now-a-days we seek to make this differentiation more evident, and to place it on a sound basis. Purely nervous asthma of reflex origin, as, for example, hysterical asthma (and you may remember how I quoted from Floyer's old book the words, "that the hysteric who wheeze much have no phlegm"), I believe to be independent of congestion and due purely to spasm; while on the other hand, there must be admitted to exist a class of cases where congestion, hyperæmia, and mucous flux are undoubtedly found playing a very important part in causing dyspnœa, and guiding us, moreover, materially as to our method of treatment.

I may just instance the congestive bronchitis and dyspnœa of cardiac disease. The gasping and orthopnœa of the state that we call cardiac asthma, may be due entirely to bronchial congestion, and I have seen, as others present also must have seen, cases of this description of congestive asthma who have been thoughtlessly told to smoke tobacco and stramonium, and who come and tell us that the smoking makes them worse, and to feel as if they would die in a faint. We may get at times attacks of muscular spasm in these cases, caused by the vascular congestion disturbing the rhythmical action of the bronchial muscle, and only then is it that anti-spasmodics may be temporarily needed. Salter was very strong on the sympathy of the bronchial muscle with the irritated mucous membrane, and went even so far as to express his "belief that severe chronic bronchitis never exists without asthmatic complication;" a belief in which I am far from agreeing with my late valued friend.

I pass, for a time, from the consideration of bronchial spasm caused by the inflamed, congested, and irritated condition of the super-jacent mucous membrane, to speak of some varieties of asthma and bronchial catarrh, due to certain exciting substances applied to the mucous membrane itself. Specific irritants acting on an unduly sensitive mucous membrane may first of all bring about rapid congestion with profuse catarrh and flux, and then, after a period of varying duration, bronchial spasm and asthma come in as distinctly secondary effects. I will briefly describe, in illustration of these statements, the symptoms and progress of an attack of summer catarrh, or hay asthma, as in this affection we have an admirable example of the points to which I wish to draw attention.

A small boy, who had enjoyed up to the age of eight years very good health, was playing in a hay field in the month of June, when suddenly he was seized with profuse flow of tears, and swelling of the eyelids, to an extent of well-nigh blinding him, at the same time came on a violent fit of sneezing. He was taken by his companions into the house, and soon recovered. These attacks continued to recur in the summer whenever the patient was exposed to their exciting cause; but what is of especial interest in the case is the fact that it was not till he was twenty years old that true asthma and breath difficulty were added to the already established catarrh. "Asthma at night," says the patient, "becomes my great trouble towards the beginning of June; after a few whiffs of a cigar I can get my breath easier and manage a deep inspiration which seems to burst open the contracted bronchial tubes, but they soon contract again, and re-set themselves at a diminished calibre. That which gives real and continued aid in my distress is smoking strong tobacco in a pipe until I am approaching a condition of collapse. A failing pulse and a damp sweating skin are always accompanied by marked alleviation of the sufferings, the relaxation of the contractile tendency affecting the bronchial as well as the other muscles." (Salter, 328.)

Here we have, then, an excellent example of hyperæmia and flux, due to direct irritation of the mucous membrane, existing for some years, and eventually complicated with a very severe form of spasmodic bronchial asthma.

Other forms of congestive catarrh and spasm of similar type are seen in examples of asthma caused by the aroma of fresh coffee, by inhaling the dust of lamp black, of ipecacuanha powder, and of linseed and mustard meal. Two cases of very severe spasmodic asthma, due to excitation of the naso-pulmonary mucous membrane by these two last-named agents, have come under my notice. One patient, recently under observation, begged me on no account to prescribe ipecacuanha in any form; "for once," said he, "I had fifteen drops of the wine of ipecacuanha given to me, and it brought on such a paroxysm of asthma, that I was well-nigh choked, my lower chest seemed powerfully retracted, the difficulty of drawing in my breath was extreme, and perspiration rolled off from me." Here the ipecacuanha wine might have acted in a reflex way, through the gastric branches of the vagus nerve.

When we examine into the history of cases of genuine hay asthma and summer catarrh, we find nearly always that the coryza and catarrh precede the asthma. Possibly, as in the case lately narrated, several years may elapse before the summer catarrh becomes complicated with breath difficulty and spasm.

Another point, brought out by inquiry into the history of cases of hay asthma, is the ingravescent nature of the affection. It grows worse with every fresh attack, and the susceptibility to the exciting cause, instead of diminishing with exposure and lapse of time, increases and becomes more deeply rooted in the system. The blood vessels more readily congest, and the congestion goes deeper down into the air tubes. The sudden advent of the catarrh is familiar to all, and one need not go far to find those who can describe all the distress attendant on the attack. A lively and telling account of catarrhus aestivus, hay, rose, or peach, cold or asthma, is given by Dr. Dobell, in his work on "Winter Cough," and is a lively bit of reading, in full detail. "The cross of my life," says the writer, "is DUST, and I print the word in capitals. Once exposed to dust, every particle is to my eyes as a grain of cayenne pepper, and itching eyes, snuffing, sneezing, and vexed temper, are at once my lot." The writer then goes on to describe the dyspnœa which follows on the catarrhal state, and presents the usual characters of bronchial asthma.

The catarrh begins in the eyes and nasal passages, and we may get speedy asthmatic complication of reflex type, owing to irritation of the Schneiderian membrane. Then the asthma reminds us of the attacks we see occasionally caused by the irritation of a nasal polypus, and which either cease entirely, or are sensibly mitigated, when the offending polyp is removed. If the direct irritation of the Schneiderian membrane does not, however, determine the asthmatic complication early, we observe the catarrhal state, as attacks recur year by year, to pass downwards into the air tubes, and then, and very often not till then, do we behold the asthma in full force. Under these conditions we must admit bronchial congestion as a most important factor of the asthma.

The causation of summer catarrh has been admirably demonstrated of late years by Dr. Blackley, and I wish that time would allow me to detail some of his experiments. Dr. Blackley finds attacks of hay fever to be most prevalent and severe about the 28th of June, and at this period of the summer he found he could collect on glass slides, moistened with glycerine and exposed to the air, the largest number of pollen granules from flowering grasses.

The first person to demonstrate by actual experiment the power possessed by pollen to excite catarrh and sneezing was Dr. W. P. Kirkman. He tells that a day or two before Christmas he noticed in his hot-house for flowers, one single plant of the *Anthoxanthum odoratum* in blossom loaded well with pollen. He thought it would be a capital opportunity for trying this particular grass; so he plucked it, rubbed the pollen with his hand, and sniffed it up his nose. Almost immediately it brought on sneezing and all the symptoms of hay fever, which continued for an hour and then left him.

Some writers have attributed summer catarrh and asthma to the inhalation of the vapour of benzoic acid given off at a low temperature. Most careful experiments by Blackley gave no support to this theory of the origin of the disease; and a series of most interesting experiments in reference to the presence of ozone in the air gave no support whatever to ozone as an exciter of hay asthma. Dust, so bitterly complained of by those subject to hay asthma, was found by Blackley often to excite the disorder in his own case; but he nearly always observed that in the dust there existed pollen granules from flowering grasses. Thus the dust encountered in a railway carriage that had come from a hay-making district would be apt to excite hay asthma in a susceptible passenger who might enter such a carriage. Pollen granules may be carried about in the feathers of fowls, and in the fur of such creatures as cats, hares, and rabbits. In experimenting with actual pollen Blackley found some kinds more active than others in bringing on the symptoms of catarrh; but the pollen of all the grasses gave more or less unmistakable evidence of its power to excite catarrh when applied to the nose, or inhaled into the bronchi (76.) The pollen of rye, *Secale cereale*, was especially active, and caused violent sneezings, with profuse flow from the nostrils. I do not find whether Blackley has proved or disproved the statements of some hay asthmatics, that it is only European grasses that cause them to suffer; in India they are free. The rapid congestion of the mucous membrane of the nares, in summer catarrh soon increased so much that no air could be drawn through the passage; and it was observed that after both passages had been equally closed for a time, if the patient recline on one side, the nasal passage which is uppermost, will after a while become quite open and free, evidently from gravitation downwards of exuded fluid. (172.)

In many cases of ordinary asthma we find the patients complaining of tightness, pressure, and obstruction across the bridge of the nose, and we may accept this as a sign of the congestive character of the asthma. True hay asthma is eminently a congestive form of dyspnœa, and if the mucous œdema affect much the tissue of the larynx and trachea, the disorder may assume a very serious aspect. That, however, a neurotic element is present, as well as congestion, seems borne out by the circumstance that the asthmatic breathing has been brought on by looking at a picture of a hay-field; and that a young lady who, in the proximity of a stable, has to sit up all night in extreme dyspnœa, next day, can dance and sing with ease and comfort.

How far nervous influence may control and affect catarrh and congestion, I will not now seek to inquire, but there are curious and interesting facts that come under our notice from time to time that are worth recording. One man, whose case has been already quoted, and to whom dust was so very baneful, declared that if when perspiring he got a chill, catarrh and asthma were the immediate results. The sympathy of the internal mucous membrane with the external skin in its disordered state is continually brought under our notice. Often we see spasmodic asthma associated with definite skin disease, and the remedy that cures the one often cures the other too. A child may have a running eczema of the skin, and at the same time obstinate bronchial catarrh, and probably any very sudden check of the external flux would tend to increase the catarrh; while a well-chosen method of constitutional treatment on the other hand would cause the subsidence *pari passu* of both the external and internal disorder. These matters respecting interchange and distribution of the catarrhal state, are most interesting and suggestive, and I was led to dwell upon them by a few remarks made to me by our President after my first lecture. The plan I had laid out with reference to the special points to be selected and treated prevents my following this inquiry so far as I could wish, but I will give the notes of two cases bearing on the subject.

Mrs. R. G., living in Warwickshire, had been for several summers liable to very profuse catarrh during the hay-making season, but knew nothing of asthma till one day she had a great fit of laughter, and then found she could not get her breath. From that time she became decidedly asthmatic, the attacks commencing with a great itching under the chin, a good deal of coryza and flux and great tightness across upper part of chest. But little expiratory wheezing was heard after the fit, and great relief was gained by taking moderate doses of hydrate of chloral. In this case I especially noticed a red erythematous rash which appeared on the chest whenever the asthma and catarrh came on, indicative, I thought, of vaso-motor disturbance and vascular congestion.

In 1871 I had a medical man, æt. 32, under my care for very troublesome asthma, of catarrhal form, and almost always this gentleman observed an eruption of real urticaria to appear on his skin whenever he had his catarrhal asthma. In this case the catarrh preceded by some years the bronchial spasm. The remedy found most useful by this patient was the induction of free sweating.

In another case, also seen in 1871, a young man, æt. 21, had been subject to spasmodic asthma, with catarrh, for nine years; and previous to that date he had suffered much from moist eczema on the skin. These instances show the reason there is for admitting vascular disturbance in the way of congestion and hyperæmia as an element in the causation of catarrhal asthma, be it hay asthma or not.

The bronchial spasm appears as a secondary neurosis succeeding often to pre-existent catarrh. To attribute the whole of the dyspnœa to congestion alone is what I am not prepared to do; for that mucous congestion intense enough to cause complete obstruction of the nostrils, as in hay catarrh, should extend in like degree by continuity of tissue all down to the smallest bronchi, can hardly be accepted, for surely then larynx, trachea, and bronchi would be so occluded as to cause actual asphyxia.

A COURSE OF

# Clinical Lectures

ON THE

## PATHOLOGICAL ANATOMY OF THE LUNGS.

By Professor CHARCOT,

Physician to the Salpêtrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

*(Continued from page 39.)*

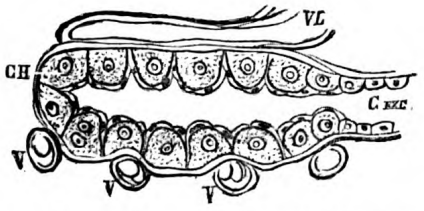
### V. Visceral Epithelial Cirrhoses in General (*continued*).

What I have just said *à propos* of the kidney, I may repeat, almost word for word, in respect to the liver, in taking as an example the group of chronic interstitial inflammations which we studied in detail last year under

the name of *biliary cirrhoses.* This group, as you will doubtless remember, includes up to the present time the following species: 1. Cirrhosis produced experimentally in animals by ligature of the bile duct; *à propos* of this, it has just occurred to me that to carry out the exact resemblance, ligature of the ureter will produce in the renal tissue lesions analogous to those which are developed in the liver as a consequence of experimental occlusion of the biliary excreting duct. This is a point which I hope soon to be able to verify. 2. Cirrhosis resulting in man from obliteration of the bile duct by a biliary calculus, or any other obstruction to the flow of the bile in this canal. 3. Hypertrophic cirrhosis with jaundice. Before entering upon the facts which will enable us to establish the parallel which I have in view, it appears to me indispensable to recall some of the details of the structure of the liver. You know that the biliary canaliculi form in the spaces and fissures which separate the hepatic lobules from one another, a network of canals whose wall is lined with an investment of cubic epithelium, analogous, that is, to the epithelial type which is found through the whole extent of the larger bile ducts. The canals which form these networks communicate, as injection has shown, and are in continuity with the system of intra-lobular biliary canals, otherwise called biliary capillaries. These, like the inter-lobular canals, anastomose, so as to form a network; but they are principally distinguished by the fact that their lumen is comparatively very small, and that they possess no proper walls. They are constituted, in fact, by simple depressions, which may be seen on one side of a certain number of hepatic cells, forming, in the lobule, a true column or trabecula.

Comparative anatomy allows us also to attach this structure, apparently so complicated and anomalous, to the type of construction of other glandular apparatus. Thus, in the adder, the walls of the glandular canal are represented by the walls of the blood-vessels, which are in immediate contact with one of the surfaces of the columns of hepatic cells. The biliary capillaries are nothing but spaces between the ranges of hepatic cells belonging to a single column or trabecula. They communicate directly with the biliary excretory canals, which have a proper wall invested by a cubic or cylindrical epithelium. The only fundamental difference which exists, from our present point of view, between the liver and the other glandular structures is, that the intra-lobular canals or biliary capillaries, instead of remaining isolated from one another, and terminating in a cul-de-sac, or in an ampullary swelling, anastomose so as to form a network, a disposition also presented by the biliary excretory canals. Supposing that this reticulated disposition no longer existed, and that the hepatic cells of a column itself were enveloped by a proper wall, we should have the appearance presented in an ingenious diagram from a recent publication of M. Farabeuf.

FIG 20.



V. V. Vessel. VL. Long vessel. C EXC. Excretory canal. CH. Hepatic cell.—(After Farabeuf).

The columns of hepatic cells, with their capillary space preserved in the centre, are comparable to the culs-de-sac invested with cells of glandular epithelium in continuity with the cylindrical epithelial investment which lines the part of the canal representing the excretory duct. You see in the diagram that the last cubic cell of the excretory duct is in immediate contact with the first hepatic cell of the corresponding layer.

These details were necessary that you might understand the kind of alteration which the liver undergoes in biliary cirrhosis. In such a case in the lobule the columns of hepatic cells tend to disappear. The lesion first attacks the periphery of the lobule, and extends progressively towards the central part occupied by the intra-lobular vein.

It proceeds in the following manner:—The ranges of hepatic cells of a single column are replaced successively cubic epithelial cells, resembling those which exist in the normal state in the inter-lobular canals. At the same time the cellular column, or rather the series of cubic cells which hereafter represents it, diminishes in diameter, and forms around itself a connective embryonic layer of greater or less thickness, which separates

FIG. 21.

Hypertrophic cirrhosis in the horse. (From a specimen by M. Morquart d'Alfort.) The section represents the edge of a lobule of the liver at the point where the newly-formed biliary canaliculi, A A, are continuous with the rows of hepatic cells, B B. These rows, isolated from one another by thickened connective trabiculæ, anastomose and form a network which answers to the disposition of the biliary canaliculi. We see besides, at D, that the two systems communicate directly with one another. At the point of junction, D, the transition is not made abruptly, and one may see all the intermediate forms between the hepatic cell, B, and the small cubic epithelium which lines the wall of the biliary canal, A.

it from the vessels with which it was previously in immediate contact. When the process has arrived at its height, as is seen sometimes in hypertrophic cirrhosis, we find in the area of the lobule, where there is developed a luxuriant connective growth, nothing more than a network of canaliculi resembling the network of inter-lobular canaliculi, and which is substituted for the network which forms in the normal state the anastomosis of the columns of hepatic cells, which is the termination of the alteration. You see that the definite result recalls the disposition on which we insisted *à propos* of the kidney and the lung. This is the place, in order to complete the parallel, for introducing in respect to the liver some details with respect to the embryonic development of this organ.

In the chicken, as was long since shown by Remak, we see about the second day of incubation, developed on each side of the duodenum, a diverticulum filled with hypoblastic cells, and surrounded by a thick layer of mesoblastic tissue. Towards the end of the third day the diverticula in question became hollowed out and lined by an epithelial investment of the cylindrical type. Soon they push into the mesoblastic mass branching prolongations, which again branch and anastomose with one another. The ultimate ramifications constitute in the mesoblastic mass a network of solid canals, filled with hypoblastic cells. According to Foster and Balfour, the hollow prolongations of the diverticula should be considered as the rudiments of the biliary canals, whilst the network formed by the cylinders full of hypoblastic cells represents the hepatic parenchyma of the adult liver. Suppose, in fact, that each of these cylinders full

of cells represents a canal whose cavity is almost effaced, you will find the principal outlines of the plan of the structure of the adult liver, such as the works of Herring especially have made us well acquainted with. If, after this summary review, you return to the details of the alterations of biliary cirrhosis, you cannot fail to be struck with the analogy which, from a textural point of view, the liver thus altered presents to the same organ in the first period of embryonic development.

Without desiring to continue longer the comparison which I have endeavoured to establish between biliary cirrhoses, broncho-pneumonic cirrhosis, and that form of interstitial nephritis which, in the language of microscopic pathological anatomy, is called the contracted kidney, I shall, nevertheless, recall once more the details of resemblance which enable us to place under one common head affections very different, both by the name of the organ which they attack, and by the totality of symptoms which reveals them during life. To sum up, two principal elements are here to be considered:—1. Modifications of the glandular epithelial investment of hypoblastic origin. 2. Modifications of the connective wall of mesoblastic origin which serves as a support to this investment. If we examine now the pathogenic point of view, we must seek whether these two elements have the same value if the two kinds of lesions are developed parallel, or whether, on the contrary, one of them precedes the others, and so to speak, dominates the situation. In other words, is the epithelium affected in the first place, and do the lesions which it undergoes communicate themselves secondarily to the subjacent tissues? or does the alteration of the connective tissue precede on the contrary that of the epithelium? or, lastly, are the two anatomo-pathological elements contemporaneous, and must we accord them the same pathogenic value? The questions which have been just put are certainly very interesting in respect to our special study. I do not see that in the present state of things they can be definitely answered; it is, nevertheless, allowable to seek the most probable solution of them. After an examination of all the circumstances, I incline to think that the epithelial lesion is the first in order, the origin of all the disorders, and I will propose to you, consequently, to call *epithelial* the visceral cirrhoses, whatever organ they affect, presenting the anatomical characters which I have just pointed out. I ask permission to pass rapidly in review the various arguments on which my view is founded. We are brought to undertake a short excursion into the domain of the general pathological physiology of epitheliums:—

1. Everything leads us to believe at the present time that the epithelial tissues enjoy, up to a certain point, an autonomous existence independent of that of the subjacent tissues which serve to support them. Thus, in pathological conditions, for instances, the epitheliums may be modified in form, regenerated and multiplied, without the concurrence, or at least, without the direct participation of the connective layer on which they lie, under the influence only of interstitial fluid—an influence necessary to the maintenance of vitality of all tissues.

*a.* The activity of old pre-formed epitheliums and its direct influence on the regeneration and multiplication of epithelial cells of the same kind destroyed by any cause, has been thoroughly shown by recent experiments. It has long been known that on the surface of a wound in course of cicatrisation the development of the new epithelial investment is made first from contact with old epithelium, and thus proceeds from the periphery of the wound towards its centre. The influence exercised on the regeneration and multiplication of the cellular elements by the old cells is here manifest. It has been placed beyond doubt by an ingenious experiment which has been adopted into practice—namely, the transplantation of epidermis suggested by M. Reverdin. The transplanted layer should include in its thickness the true living layer of epidermis, that is to say, part of the network of Malpighi. Without entering into detail on this remarkable experiment, I would recall the fact that the transplanted layer soon contracts adhesions to the granulation tissue which forms the base of the wound, and then we see formed at the edges of this graft a new epidermis, which constitutes an islet whose borders extend daily.

M. Schweninger has lately varied the experiment, and has shown that the transplantation of a hair carrying with it a portion of its epidermic sheath, may similarly become a point of origin for the formation of an epidermic islet.

# Original Communications.

## ON A CASE OF ADDISON'S DISEASE IMPROVING UNDER TREATMENT, AND ON THE RELATIONSHIP BETWEEN THE DISCOLORATION OF THE SKIN IN THAT DISEASE ON THE ONE HAND, AND VITILIGO AND ALOPECIA AREATA ON THE OTHER. (*a*)

By McCALL ANDERSON, M.D.,

Professor of Clinical Medicine in the University of Glasgow, and Physician to the Glasgow Western Infirmary.

GENTLEMEN,—It is not my intention to enter fully into the subject of Addison's disease, but merely to show you a patient who has been very greatly improved by treatment, and to refer generally to the possible connection between the discolouration of the skin in that disease on the one hand, and vitiligo and alopecia areata on the other. The lad referred to is nineteen years of age, a wood turner, and was admitted into the Western Infirmary on July 16, 1878, suffering from loss of appetite, extreme languor, and debility. He seems to come of a tolerably healthy family, although his brother is suffering from some form of lung affection. He was always strong and well until about five months prior to admission, when his appetite began to fail. He lost all inclination for food, and was inclined to sleep, or to sit languidly at the fireside. Exertion of any kind was distressing to him, and he gradually lost flesh. Shortly after this his friends began to remark that his skin was becoming darker in colour, although he was always somewhat swarthy. There has been no change, however, in his hair, either as regards texture or colour; and although anorexia has been a prominent symptom, he has never suffered from nausea or vomiting.

On admission, he was found to be considerably emaciated—weight, seven stones and a quarter of a pound. The whole skin was of a dirty brown tint, and decidedly darker than natural; this was especially marked in those situations which are naturally most pigmented, such as the scrotum, penis, nipples, &c. The anterior was, on the whole, somewhat lighter than the posterior aspect of the body; the vaccination marks on the left arm were in parts very dark, and there was a large dark patch on the front of the chest, where a mustard plaster had been applied some time previously. There was no discoloration of the mucous surfaces, which were pale.

An examination failed to detect any disease of internal organs; there was neither pain, tenderness, nor fulness in the region of the kidneys, and the urine was natural. Pulse 96, rather weak; respirations 24; temperature ranging from 98°2 to 102°—which, however, it only reached on one occasion, and for the most part it remained within the limits of health. I need not enter into the diagnosis of this case. It was admitted by all, who had an opportunity of seeing it, to be a well marked illustration of Addison's disease; and you will have the opportunity, shortly, of judging for yourselves.

Before referring to the treatment which was adopted, let me say a few words as to the possible connection

(*a*) Read before the Glasgow Medico-Chirurgical Society.

between the discolouration of the skin in Addison's disease, on the one hand, and vitiligo and alopecia areata, on the other; merely premising that it is a well ascertained fact that it is not every disease of the supra-renal capsules which is associated with the symptoms of Addison's disease; that, on the contrary, there is only one morbid condition which is capable of producing them—viz., scrofulous affection of these organs. Further, there is good reason to agree with Dr. Greenhow's opinion, that the symptoms are not dependent upon the destruction of these bodies, seeing that they may be entirely destroyed without the production of the symptoms, but upon the extension of the morbid process to neighbouring parts, especially the solar plexus, and the semi-lunar ganglia.

Vitiligo, or leucoderma, as it is termed, is a comparatively rare disease (although I have seen a good many examples of it), as appears from the fact that among 11,000 consecutive cases of skin disease which came under my notice, there were only four of vitiligo. It is, as you will observe [plate exhibited], characterised by brown patches, enclosing others which are preternaturally white. It is, in fact, a pigmentary affection, due not so much to excessive deposit, as to irregular distribution of the pigment of the skin. It is much less common in white persons than in negroes, in whom it gives rise, of course, to much greater deformity, and induces a piebald appearance. It is also to be noted that on the head the hair growing from the white patches is entirely devoid of pigment.

Now, you may naturally ask, What has this to do with the discolouration of the skin in Addison's disease? That will be apparent from a consideration of the case of a patient who first consulted me on 4th April, 1872. He was a married man, 50 years of age, complaining at that time of frequent seminal emissions, and a slight eczematous rash on the upper arm, with erythematous blotches on the chest. Even at that time he was very pallid. Under a course of iron, &c., he soon recovered. I lost sight of him until 8th August, 1876, when he again came to me complaining of debility, which had been increased by an attack of diarrhœa. I found him very weak, and with a feeble circulation. It was then I observed that there was a dirty pallor of the skin, contrasting strongly with the pearly conjunctivæ, and he told me that he had been very closely confined to business, in badly-ventilated rooms. On the 3rd May, 1877, I saw him again, when all the previous symptoms were present in an exaggerated form, and, in addition, there was a great tendency to vomiting. On the 25th July he again complained of vomiting, and his bowels were inclined to looseness. At this time I noticed that the dusky tint of his skin was much more pronounced, and that on some parts, particularly upon the backs of the hands and arms, the discoloration presented all the characters of vitiligo, that is to say, there were white patches, surrounded by others, which were deeply pigmented. I saw him, for the last time, on the 4th September, when he was much in the same state, shortly after which I went abroad for a few weeks, and he then consulted my friend Dr. Maclaren, who wrote me as follows regarding him :—

"I only saw him during the last week of his life, when the usual symptoms of the disease were well marked—great langour (he was entirely confined to bed), anæmia, discoloration of the skin, with white patches here and there, loss of appetite, weak pulse, and vomiting. The treatment consisted in giving him wine and nourishment, and dialysed iron. He sank from sheer exhaustion."

He died about the end of October, and we were fortunate in being permitted to have a partial post-mortem examination, which was conducted by Dr. Foulis. The following is that gentleman's report (permission was given only to examine heart, capsules, and kidneys) :—

*Heart* rather flabby; tissue of a pale brown tint; no vascular lesion.

*Kidneys*—Both had the characters of the large white kidney of Bright.

*Capsules*—Both converted into white, firm, reniform bodies, embedded in adipose tissue. On section the capsules presented a pale, yellowish-white surface, mottled here and there with pale gray and yellow tints. No trace of the normal texture of the capsule remained. On microscopic examination the structure is seen to vary in different parts. In one place a dimly granular fibrous tissue is visible. In another there is nothing but closely packed and rather shrunken small cells, rather less in size than the ordinary white blood corpuscle; while elsewhere, these cells are obscured by a fine granular débris, as if they were disintegrating.

Here, then, we have a case of Addison's disease in which the discoloration of certain parts presented all the characters of vitiligo; and, although it is unique in my own experience, Dr. Greenhow has reported one or two cases of a similar nature.

I have long held that vitiligo is dependent upon perverted innervation of the sympathetic nerve, and that it is a neurotic affection seems to be the general opinion. Thus, Hebra states that it is due to "disturbance of innervation;" Tilbury Fox, that "it is dependent on depressed innervation;" and Erasmus Wilson considers it "a neurosis, the result of weakened innervation." Thus we are led to surmise that there may be some connection between the discolouration of the skin in this affection and in Addison's disease, in so far, at least, as they are probably both dependent upon disturbance of the functions of the sympathetic nerve.

You are all familiar with the disease to which the name alopecia areata has been applied. It consists of circular patches of baldness, varying in extent from a solitary small patch to the removal of every hair on the body. I shall not occupy your time by discussing the question, whether there is a parasitic form of this disease. But I am perfectly satisfied, at all events, that there is a non-parasitic form; one of the proofs of which is to be found in the following cases, though not cited for this purpose. On the 15th October, 1874, a gentleman, aged about 25, rather pale, but otherwise healthy, consulted me on account of an attack of alopecia areata, which presented all the usual features of that disease—round bald patches, some studded with little stumps of hairs, some with downy hairs. The disease had almost entirely removed the eyebrows, and, to a considerable extent, the eyelashes. It had existed on and off for twelve years; and about five years before I saw him he first noticed white spots and patches on the hands and other parts. On examination I found that the greater part of the trunk of the body, and, to a large extent, the neck and backs of the hands were the seat of well marked vitiligo.

I saw this patient again on July 12, 1875, when I found little change, either in the alopecia areata, or in the vitiligo, and there was no deterioration of the general health. It may, no doubt, be urged that this case is not conclusive; and that the two affections occurring together in the same person may have been a mere coincidence. But a different complexion is put upon the matter if it is viewed along with the following :—

A girl, æt. 10, healthy looking, and born of a sound stock, consulted me on 30th June, 1870, on account of round and irregular bald patches on the head, the latter being due to the coalescence of neighbouring round ones, and implicating in all about one-half of the head. The case, in fact, presented all the naked eye characters of alopecia areata. She was recommended to regulate the bowels with simple aperients, to take small doses of wine of iron, and Fowler's solution, and, after shaving the head, to sponge it night and morning with a lotion of perchloride of mercury (four grains to the ounce). On 28th July all the bald patches were thickly clothed with hair, which, as is usual in such cases when the hair first reappears, was white, owing to the absence of pigment. So far, there was nothing unusual in the symptoms, until 23rd Dec., when the patient again visited me. The hair

was then perfectly healthy, but, to my surprise, as white in the sites of the previous bald patches as on the 28th of July, the scalp in these situations being also devoid of pigment. She then showed me what had appeared about a fortnight previously on her shoulders and back, namely, round and oval white spots, from the size of a crown downwards, the skin at the edges being deeply pigmented. In fact, she now presented all the characteristic appearances of vitiligo. These two cases tend to show that there is a very close relationship between alopecia areata and vitiligo. Now, if it be true, as we have endeavoured to show, that there is some connection between the symptoms of vitiligo and the discoloration of Addison's disease, then alopecia areata seems also to be connected with the discolouration of Addison's disease. Of course, I do not mean to say, nor do I suppose, that disease of the supra-renal capsules has anything to do with the production of vitiligo or of alopecia areata, but simply that a somewhat similar perversion of the function of the sympathetic nerve lies at the root of the symptoms mentioned in all three.

You are well aware that the prognosis of Addison's disease is gloomy in the extreme, and that treatment has consisted exclusively in attempting to subdue special symptoms, such as irritability of the stomach, and to improve the strength of the patient by means of nourishment, stimulants, and tonics. On reflecting on the very unsatisfactory results which have accrued from this palliative and symptomatic treatment of the disease, it occurred to me that a somewhat different treatment might possibly be of service, or at all events, that it could not well be less satisfactory than the usual routine. I reasoned thus: Addison's disease has now been proved to be dependent upon a scrofulous affection of the supra-renal glands. Now, when a localised scrofulous affection attacks any other part of the body we treat it constitutionally by means of antistrumous remedies, and by strong local application if it is on the surface, or by stimulants or counter-irritants in some shape or other if more deeply placed. Then, why not resort to similar treatment when the supra-renal capsules happen to be the seat of the disease? I accordingly treated this case by means of blisters over the renal regions and cod-liver oil, combined with rest, good food, and four ounces of wine daily. The oil was commenced on 16th July, in doses of a teaspoonful, gradually increased to a tablespoonful thrice daily. From the middle of September onwards, from two to three ounces have been administered daily. Three blisters were applied to the right renal region, on the 23rd July, 30th August, and 30th October; and two to the left on the 3rd August and 15th September. On the 20th October the following note was taken: "Patient is a very great deal stronger; he walks rapidly, with a firm step, as if in perfect health. But he states that he still feels a little weak, though not half so much as on admission." His colour also is much paler; a fact which is corroborated by the patient himself, as well as by others in the same ward. The most remarkable improvement, however,—one with regard to which no doubt can exist, and which is the most striking sign of amendment in strumous affections generally—is in the body-weight, as is shown in the following table:—

| | Stones. | lbs. | | Stones. | lbs. |
|---|---|---|---|---|---|
| July 22 | 7 | 0¼ | Sep. 9 | 7 | 10 |
| „ 29 | 7 | 0½ | „ 16 | 8 | 0 |
| Aug. 5 | 7 | 2 | „ 23 | 8 | 0 |
| „ 12 | 7 | 2¾ | Oct. 7 | 8 | 8 |
| „ 21 | 7 | 5 | „ 14 | 8 | 10 |
| Sep. 2 | 7 | 9 | „ 21 | 8 | 11 |

That is to say, from 22nd July to 21st October, he has gained 1 stone 10¾ lbs. in weight.

I do not bring this case forward as an instance of a cure of Addison's disease, but as an illustration of great improvement resulting apparently from the carrying out of what we may call a rational, as distinguished from a purely empirical, method of treatment; and I shall have pleasure, at a future time, in reporting the further progress of the case.

# Clinical Records.

## ST. MARY'S HOSPITAL.

*Laceration of Hand—Sloughing into Wrist-Joint—Amputation of Forearm—Acute Pleuritis five weeks after Operation—Recovery.*

Under the care of A. T. NORTON, Surgeon and Lecturer on Surgery.

From notes by MR. KENNETH MILLICAN.

ON Nov. 16th, 1878, A. P., domestic servant, a healthy girl of 18, was being driven in a cab when the horse ran away. She opened the door and was thrown out, the wheel passing over her left hand. She was brought into the hospital faint, and in great pain, but having regained consciousness. The left hand was very much lacerated, skin was torn from a point on the forearm midway between the two styloid processes, round the base of the thenar eminence, and thence straight across the palm at the level of the upper border of the abducted thumb. Another rent commenced at the point of the origin of the first, and proceeding along the hypothenoid eminence, ended barely a quarter of an inch short of the termination of the first at the ulnar side of the palm, thus leaving the skin of the palm only attached by a narrow strip at the inner side. The branches of the palmar cutaneous nerves were dissected out, and the adductor muscles were torn across. There was considerable hæmorrhage, and a great deal of effusion at the back of the hand and in the forearm.

As the patient was low and faint, brandy was administered; and then the skin of the palm was united by three silk sutures in the longitudinal radial cut, and two in that passing transversely across the palm. The wound was then well syringed, and dressed with carbolic lotion, and tinct. opii ℥ xxv., administered. Considerable hæmorrhage occurred in the night; next morning there was also extensive effusion in the right cheek. The temp. was 100·4° F.; pulse 128, and very weak. The patient had a sleepless night, being in severe pain. The wound was redressed; a firm pad being placed in the palm. Between this date (Nov. 17th) and Nov. 22nd, the temperature varied between 101° F. and 104° F. A hot water bath was then ordered for the arm by night, while it rested on a pillow in a poultice by day. On the 23rd and following day, two incisions were made in forearm to relieve the suppurating cellulitis. On the 25th, more serious symptoms began to supervene. The tongue was furred, the pulse 128, full and bounding; face flushed and hectic, nostrils dilated. The temperature kept vacillating between 102° F. at night, and 100° F. in the morning. These were followed on the 26th, by the discharge of a considerable amount of fœtid pus, the skin of palm sloughing, and the slough spreading towards wrist-joint; the forearm was enveloped in a poultice. The next day all the before mentioned symptoms were increased, and in addition several severe rigors set in. Extensive suppuration; pus yellow, chiefly confined to planes of cellular tissue in forearm. On the 28th the pulse was 132; the inflammation had, however, considerably subsided. The 29th and following days, seemed to mark an improvement; the wounds were granulating well; the temperature had remained between 100, and normal, and the suppuration was decidedly diminishing, when a rise of temperature on Dec. 5th to 104° F., accompanied by rigors warned of further mischief; and on examination of the wrist-joint two sinuses were disclosed by the probe. The sloughing had ceased by this time. The pulse now began to get very weak and small, retaining an average frequency of 116 to 120; and the discharge from forearm continued to be very profuse, accompanied by an erysipelatous blush.

On Dec. 11th Mr. Norton removed the forearm under chloroform, employing the modified circular operation, short anterior and posterior semi-lunar skin flaps, with

further dissection of the skin to line of section of the bones at junction of upper with middle third of arm. The whole operation was performed with Lister's antiseptic spray. Drainage tubes were inserted, and the stump supported on a splint. Temp. at night, 102·6° F., Slight hæmorrhage took place in the night, and there was considerable pain, causing insomnia, notwithstanding a hypodermic injection of morphia. The temp. fell next morning to 101·4° F., but rose at night again to 103·4° F. On the 13th, there was a marked improvement. Patient seemed better in herself; the temp. was down to 100° F.; the pulse, 128; but the appetite good. The wound was doing well when dressed antiseptically on this date, the flaps healthy and uniting well. It was again dressed on the 16th, when considerable discharge was found in the cavity which had been formed high up in the arm by the former cellulitis. A serious flow of pus escaped through one of the incisions made high up in the arm before the operation, and which had been taken in in the flaps and utilised for drainage. The wound was now dressed daily, the stitches being removed, and the flaps continuing healthy. On the 18th, however, a further complication arose. The temp. suddenly rose to 102·4° F., and on seeking the cause, pain in lower right chest, accompanied by difficulty of breathing, drew attention to that part, where the stethoscope revealed friction sounds. No dulness; pulse, 118. Patient was moved next the fire. On the 19th, pulse small, regular, 129; cough troublesome; friction sounds had ceased, but dulness and absence of respiration in infra-axillary region showed the effusion of fluid. The wound was looking well; little, if any, discharge. Quiniæ sulph., gr. ij., with acid sulph. oil, vin ipecac., and liq. morphiæ muriat., ordered. The 21st showed considerable grumous discharge in the dressings, which were, however, sweet; cough bad; resp., 24, short; face flushed; considerable perspiration. On the 23rd the chest was again carefully examined. There was dulness from fifth rib, and obstructed vocal resonance; resp., 30; pulse full, quick, and bounding, 126; temp. 102° F. On the 27th patient was apparently worse; cough very troublesome; resp., 34, laboured; expectoration, containing some liquorice colour; pulse tremulous, irregular in force, 126; tongue white and furred. The 30th saw considerable improvement. There was less hectic and cough; pulse, 108; resp., 30; temp., 98° F. The discharge from arm slight and sweet; dressed daily. On Jan. 3rd, a sinus leading upward on outer side of arm about two inches long, and containing pus, was found, which was opened on the following day; temp., 103·4° F. On Jan. 5th the antiseptic dressing was discontinued, and water dressing substituted. Considerable discharge from wound. The effusion into pleura still marked. She sat up for the first time on this date. On Jan. 15th the temp. rose at night to 101° F. Another sinus running transversely across arm from lower opening of the first was discovered, its inner extremity opened, and a drainage tube inserted; temp. 98·2° F. A small point of both radius and ulna were projecting slightly through the skin. On the 22nd the projecting portion of radius was removed by forceps; dressed daily. Drainage tube removed on 23rd. By Jan. 27th the transverse sinus was quite healed, the longitudinal one on outer side still discharging slightly from its lower half only; the upper half had closed. By Feb. 1st discharge almost entirely ceased. On the 6th the opening over radius had closed; a slight spicule of bone came away from ulna. Two small places discharging were dressed with ung. zinci, water dressings being discarded on this day. The health and appetite were good, and the flaps united. On Feb. 8th the patient was well enough to go out.

*Remarks.*—The two important points for consideration are—the question of amputation, and the origin of the pleuritis. As regards amputation, the cellulitis had completely separated the skin from the deeper tissues, as far as the elbow, but the constitutional symptoms were not such as to suggest amputation until Dec. 5th, when sloughing exposed the cavity of the wrist-joint and an immediate elevation of temperature ensued, with a rise in frequency of the pulse. The loss of soft tissues by sloughing, the exposure of the wrist-joint, the extensive cellulitis, and the increasing severity of the constitutional symptoms, called for immediate amputation.

Five weeks after the operation acute pleuritis set in with a bounding pulse. The surgeon would naturally suspect the pleuritis to be pyæmic, but it was diagnosed to be a distinct inflammation and not consequent upon the wound. The symptoms which gave rise to this view were the absence of pyæmic rigors, the strong pulse instead of the severe depression, and the detection of the friction sound of the first stage of pleuritis, which in pyæmia would probably not be recognised owing to the subacute origin of pyæmic inflammations.

# Special.

## REGIMENTALISM *v.* UNIFICATION IN THE ARMY MEDICAL SERVICE.

THE literature of regimentalism (meaning thereby the hostility of the medical profession to the abolition of the regimental system) would fill a bulky volume; but that of unification (or the reasons in favour of such abolition) has been hitherto a sealed book as far as medical readers are concerned. This is not fair. Both sides ought to be heard. His Royal Highness, Sir William Muir, and the combatants, ought to have their say as well as the doctors and the Colleges, and, as it has always been the strict principle of the *Medical Press* to encourage fair discussion, we think it right to give some space to a counter-blast to regimentalism, without at all implying that we have altered our opinion on the relative merits of both systems. That counter-blast may be perused *in extenso* in the form of a pamphlet, by Dr. Evatt, entitled "Army Medical Organisation: a Comparative Examination of the Regimental and Departmental Systems;" and it is appropriately dedicated to the Director-General.

Dr. Evatt treats the subject in a clear and simple manner, avoiding all technicalities, and from such points of view as will commend themselves—first, to England and the common sense of the country; second, to the military officers of the army; third, to the medical officers of the army; and fourthly, to the members of the medical profession at large, whether professors, teachers, or practitioners in civil life.

He points out with much force, that England is placed under special circumstances, which make special organisation an absolute necessity.

"Not only are her soldiers obtained with great difficulty and maintained at vast expense; not only has she to attract the volunteers instead of compelling the conscript; but in addition to all this her soldiers are scattered over a widespread empire, garrisoning posts in every possible climate, and exposed not only to war risks, but to every possible variety of disease.

"Not Germans, nor Frenchmen, nor Austrians are exposed to sickness as our soldiers are exposed, and Russia alone can compare with us in the extraordinary chances that send our men from Halifax to Peshawar, and from Bermuda to Hong-Kong. Apart from all field service, our soldiers are daily fighting in a campaign with tropical climates and acute diseases such as are never heard of in other European armies, and to assist these men in their struggle with disease, an efficient medical corps is most essential."

He goes on to say "it is needless to say that the army, both in the military and its medical branches, has been for some years divided into two schools of thought on the system of army medical organisation, one party supporting the system called regimental; the other standing by unification or departmental views."

The picture of England's military condition up to 1871, is sketched by Dr. Evatt as follows:—

"The English army until 1871, existed as a series of detached regiments, a certain number of which garrisoned the home stations, and a great number of which were scattered about in single regiments and detachments over the face of an enormous empire. India and Canada were full of far-detached stations, each consisting of a single regiment. The West Indies, in like manner, was so garrisoned. Australia, New Zealand, the Cape, Ceylon, the Ionian Islands, were all so occupied. Most military stations were held by single regiments, and in very many cases by small detachments.

"These regiments had no territorial connection whatever beyond the faintest shadow of a name. They had no reserves. They were as strong as the men actually present with the colours made them, but no stronger. If war was declared they enlisted locally what raw material they could, but in those days a regiment was a definite unit never varying, and the army was not only a long service army, but for many years a life service one.

"Corresponding in every way to the military organisation, the medical organisation of the service in those days was wholly regimental, the sick and wounded of the army were treated in separate regimental hospitals, each an adjunct of either a regiment, battalion, battery, or detachment, the military commanding officers of which were responsible for their efficiency. However numerous the various battalions or batteries in a garrison were, each had their own little hospital, wholly separate and distinct from every other corps in the garrison, whether as regards buildings, offices, instruments, medicines, medical officers, or sick attendants.

"To the medical officers who acted under him were delegated the prescribing duties for the sick, but here their responsibility ended. The regimental commanding officer was alone responsible for the cleanliness and order of the hospital.

"To obtain a new key for the door, a new pane of glass for the window, or a new slate on the roof, he, the commanding officer, alone was responsible, and he alone could apply to the supply departments."

The least irregularity in the conduct or neglect of duty by sergeants, orderlies, or patients was invcstigated solely by the commanding officer, the medical officer having no responsibility in the matter, beyond reporting it. The commanding officer issued all orders for the interior working of the hospital. The orders for the rising and going to bed of patients, their duties in the wards, and in fact everything not included in their purely medical treatment was arranged by the commanding officer.

The author deals with the "supposed advantages of the regimental system" in very trenchant style. The first of these advantages he supposes to be *that the regiment had its hospital complete and ready at all times, in peace and war, and was therefore perfectly independent of the army as a whole.*

"The supporters of the regimental system seem to think that because the word regiment remains that the army is still regimental in the old sense. This is far from being the case. In the old days a regiment was a definite fixed unit, practically the same in number and organisatfon in peace or war, and averaging 800 men at all times. It was, in fact, just as strong as the men serving with the colours made it, but no stronger. There was no local tie whatever, no reserve of any kind, nor any means of supporting the regiment in the field by supplies of trained reservists. Under the old system it was known then that 800 would have an average number of sick, and a definite provision was made for them on this estimate. To-day all this is changed. The regiment is no longer the unit for the army, and the brigade has become the unit.

"In peace a regiment will be perhaps 400, perhaps 450, strong, and when the army is mobilised it will be suddenly swelled up by calling in the army reserve, the militia reserve, the drafts from the linked battalion, and the brigade depôt to 1,100 or perhaps 1,200.

"But if the hospitals were to be worked regimentally, on what basis are we to reckon? Shall each regiment have enough medical officers, orderlies, and equipment for the peace establishment and the small skeleton of 500 men, or for the war footing and the full field strength of 1,200? What about the orderlies and nursing staff? Are they to be entertained all through peace to await war, or they are to be always on a peace footing? How about the bedding and clothing, medicines, instruments, and such like? Either we would have a crowd of idle unemployed men in peace or a deficient number in war; the first entailing tremendous expense in peace, the second certain disaster in the field. But in addition to this we all know that no trustworthy regimental average of sick or wounded can be formed, Position in attack in battle, exposure to a heavy fire, or unhealthy camp sites, may always cause one regiment so exposed to suffer heavily, while other regiments in the same division probably escape altogether, so that all our regimental calculations are liable to be thrown out, although divisional calculations generally will maintain an average.

The second supposed advantage is, "that the medical officers learned to know the men, prevented scheming, and thus benefited the State.

"Here again there is a failure to grasp modern changes in army life. In the old days a soldier enlisted in the army for life, and could only get out by purchasing his discharge or by invaliding. Since that time all has been changed. Men now enlist for six years with the colours, and six years in the reserve passed in civil life; but many thousands of men have gone to the reserve at three years' service, and owing to the linking of battalions and the interchange of men between them and other causes, a regiment now is continually changing its component parts. If the pre-Crimean doctor knew the pre-Crimean soldier, it was because, under long service rules, both served long years, in fact lifetimes, together, but that is now all passed away with the introduction of short service systems. Knowing the men in the old intimate way is quite impossible either for commanding or medical officers, and is indeed not essential.

The final presumed advantage of the regimental above the unified service, is "that it formed a pleasant home for the medical officers of the service.

"This is another statement which melts away on examination. It cannot be denied that under the regimental system several hundred army medical officers had a definite home in a regiment, but we cannot ignore the fact that in 1873 at least 300 officers of the department never by any possible chance could find any regiment to get into, as of late years the army medical staff not attached to regiments has largely been increased.

"This is quite well known to all medical and military officers. I find that in 1844, there were fifty-nine staff assistant surgeons, in 1872 there were 228, besides a very large number of staff surgeons, and this number existed at a time when every regiment had its regular complement.

"It would be absurd to deny that throughout the entire army, in every rank and grade, the regimental tie has of late years become much weaker.

"For the medical officers the tie that bound them to their regiments was of late years becoming every day less marked, and the average service of each officer with his regiment was, in 1873, not more than three years. The increase in the non-regimental medical staff and the concentration of regiments in large camps in England and Ireland, and the withdrawal of corps from detached positions in the colonies, have all tended to draw both regimental and staff medical officers together, and to weaken the whole regimental ties which were for the doctors so essential in the old army days, but are now not only of little necessity but positive drawbacks.

"Now in every garrison at home and abroad the officers of the Army Medical Department form a separate and distinct corps of themselves, as united and compact as the Royal Artillery, the Engineers, or any other branch of the service.

"They now serve under their own chiefs, work their own hospitals, wear their own uniform, and are perfectly free from any deadweight.

Dr. Evatt now turns to consider the other aspect of the question, or the drawbacks and weak points of regimental medical organisation.

"Regiments are no longer the unit of organisation.

"Let us take the 1st battalion 25th regiment as an example.

"Say it is stationed at Aldershot, and war being imminent the order is given to mobilise. On the day the order is issued the regiment at home is 480 strong, consisting of the officers, non-commissioned officers, and the young soldiers serving with the colours. Its brigade depôt is at York; its linked militia battalions are the 2nd and 5th West York Militia; its reservists belong to the same Yorkshire district.

"At once on the order to mobilise being received the regimental reserve in civil life hasten into York to the depôt, and are armed and clothed to the number of 400 men.

"The depôt of the regiment permanently located in York furnishes 100 more men, being the young depôt soldiers of the 2nd battalion then abroad. The two associated battalions of

militia are called out, and the militia reserve from each 70 strong, or a total of 150, join the reservists and the depôt contingent in York. The whole, to the number of 650 strong, are put into the train, armed, clothed, and equipped, and arrive in Aldershot five days after the order to mobilise issued.

"At Aldershot they join the regiment and are told off to the companies. As there is no hutting room, tents are drawn from the army store depôt, and they are sheltered. The commissariat, warned of their arrival, issue 1,100 rations instead of 480, and all goes well.

"But how about the hospital? Let us imagine it under the regimental system. The 480 men who formed the original regimental strength having only an average of about 30 sick, needed only two medical officers at most to look after them, and with them is a hospital sergeant and four or five orderlies, a staff based on 480 strength. The medicines, supplies, the bedding, all the equipment, the very building itself, is based on, say, 500 strength, but the new arrivals have made it 1,100 strong. What is to be done? At once confusion would begin. The medical officers were too few, the sergeant would be overwhelmed, and the orderlies simply overborne by the increased sick, which rose at once from thirty on the day the order was issued to mobilise, to eighty after the 640 men had been under canvas for a week. What is to be done? Apply to the principal medical officer of the camp? But, as we are imagining, the regimental system is at work; he has little, in fact no power. It is true the 36th regiment is close by the 25th, and the 47th is also near, and the 58th is not a quarter of a mile away, and two artillery batteries are within easy distance. Each of these separate regiments has two medical officers, one hospital sergeant, five orderlies, bedding, medicines, and equipment quite idle. They are not mobilised, having just come from foreign service, and their medical staff are really quite idle, with perhaps 20 or 30 sick in each separate little hospital, each hospital having 20 spare beds in it. The principal medical officer is powerless to act; he cannot send one man of the eighty sick of the 25th into any other hospital, nor can he move an orderly, a sergeant, a medical officer, or a splint, or mattrass, or pillow, from one of the hospitals to the 25th. The 25th hospital is disorganised, men are neglected, improperly nursed, and all goes wrong.

By stress of applying to the general commanding, the principal medical officer gets two medical officers detached to assist the 25th doctors. One comes from the 36th and one from the 47th regiment. But not an orderly, a sergeant, or any supplies can be made available.

"The 36th doctor is shortly after recalled to march away with his own corps, and perfect confusion remains.

Men die, the general finds fault, the press take it up, England is excited, and who is blamed? The medical department and the principal medical officer.

"It is needless to say that he is wholly blameless. It is the system and not he that was wrong."

We cannot afford space for the various minor drawbacks of the regimental system quoted by Dr. Evatt; for instance, the maintenance of a separate hospital for each regiment during peace—the absence of libraries, laboratories, and expensive instruments—the impossibility of obtaining skilled nurses. Dealing with the question of relative expense, the author says, "Take Portsmouth: say one corps has just arrived from India, and was full of sickly soldiers, the other six battalions were very healthy indeed, yet all of them had the same detail of two medical officers. Thus five hospital staffs were perhaps quite unemployed, the sixth was never at leisure. England kept paying for some medical men who perhaps had very little to do, and however anxious the medical officers were for work, each officer was compelled to limit his duty to his own little regimental hospital.

"If the regimental system was expensive in peace and injurious to professional efficiency, in war time it was simply unworkable.

"The medical department under such a system was perfectly paralysed. It tied the hands and feet of the directing medical officers of the army, and then blamed them for not walking and working. Every regiment that embarked for Crimea, or that in 1871 would have embarked for any continental war, would have had its medical staff of three doctors, a sergeant, and some orderlies, and its little regimental hospital with its little share of transport and equipment, all marching with the regiment. Fancy an army corps so organised with perhaps 30 battalions of infantry, 6 regiments of cavalry, and 10 batteries of artillery, each of them with its little hospital. In all 46 separate hospitals, each, say, with even two medical officers, or, say, 100 surgeons, 46 hospital sergeants, and some few hundred of regimental orderlies. Let us imagine all these separate hospitals marching in the rear of the columns, each perfectly independent of every one save the regimental commanding officer, each hospital staff in separate regimental uniform, whether infantry, hussar, highlander, gunner, or sapper, &c. Imagine then the army corps forming into order of battle and attacking such a position as the Alma Hills. Ten battalions, two cavalry corps, and four batteries, alone come under fire, and they alone are full of wounded. The medical staff of the regiments under fire are at work night and day, and still men die unattended. In the meantime three-fourths of the doctors are quite idle because their regiments have not been under fire, yet no one can move them to the assistance of the worn-out doctors of the wounded corps. The principal medical officers are in despair: but what can be done? Yet this was the system at the Alma, and it might have been the system still were unification not introduced.

"It left the medical department a sham, and paralysed all efficiency. It seems impossible to believe such a system can find supporters. Not a single military writer of any character whatever supports such a system. It was simply courting ruin to carry it out. The lesson of the Crimea we have never forgotten. It was there in the tents of that devoted army that the thinking medical officers of the service first raised the question of unification; and to-day, after twenty years of patient waiting, it is an accomplished fact.

Having thus given the leading arguments adduced by Dr. Evatt, we are obliged to conclude our notice of his pamphlet, although there is much remaining which is well deserving of attentive consideration. He asserts that the regimental system was also defective, inasmuch as it "(*a*) prevented all training in administration of hospitals; (*b*) prevented all development of professional knowledge amongst army medical officers; (*c*) ruined true *esprit de corps* amongst the medical officers; and (*d*) was the cause of unequal foreign service and irregular tours of duty.

Referring to the compromise between regimentalism and unification which has been suggested, the author is particularly emphatic.

He says, "it has been proposed that a compromise system should be introduced for working in the medical service of the army. It advocates in peace petty regimental hospitals worked on a regimental basis by regimental officers to be the rule, but when war is declared, at once, general hospitals to be organised and worked by the regimental officers concentrated together. It is needless to say such a system is quite out of the question. If an army had one system for peace and another wholly different for war, disaster is as certain as anything can be. Imagine the English army, with its medical system worked regimentally, suddenly embarking for Antwerp. It left England with a regimental system, it disembarks with a sham departmental system.

"That is to say, a crowd of regimental officers never trained in large hospitals, but taken from petty battery and regimental hospitals, are suddenly massed in large general hospitals, or put to work divisional field hospitals in a campaign. As in peace the regimental commanding officer and the regimental quartermaster did all the discipline and transport work; the regimental doctors know nothing of it; not one of them even saw a large army hospital worked. The senior medical officer perhaps comes from a battery of artillery and now takes charge of a division of an army and a set of army hospitals for 800 sick.

"A crowd of medical officers each differently dressed, a crowd of hospital sergeants drawn from every corps, and a mass of orderlies without cohesion, without *esprit de corps*, grumbling to get back to their regiments, impatient of all discipline and control by officers and sergeants they never heard of or saw before. Transport brought from various quarters. A field hospital mobilised at a week's notice. No hospital corps. No fixed routine of work. Regimental commanding officers clamouring for their doctors and withdraw-

ing them when most wanted! Doctors struggling to get away to their regiments, no co-ordination nor departmental *esprit de corps*, and directing all a principal medical officer whose duty in peace time is to inspect diet rolls and prescription books, and we have all the elements of disaster ready at hand. "Such a system of compromise is impossible."

After all that Dr. Evatt and the advocates of regimentalism have said, there remains, we imagine, a potent cause for the dissatisfaction of some medical officers respecting unification, which cause has not been yet confessed by either party. The fact, is that the average medical student hankers after the serene social supremacy which he thinks that combatant officers enjoy, and after the life of idleness and amusement which has heretofore been the lot of those officers, from cornet to captain. He covets the privilege of being able to talk about "our f'lahs," of dining at mess, and being one of the God-like creatures whose adoration by silly girls he has been accustomed to observe. He longs for promotion from the plentiful but plebeian leg of mutton and turnips to the more *distingué* but less satisfying *menu* of the mess table.

With newly-fledged doctors all this stands for a good deal, and as the general belief is that attachment to a regiment constitutes the embodiment of all these delights, there are very many of the socially inferior class of students who prefer a semi-menial association with combatant officers to a communion on equal social terms with their own brethren, and such students have, therefore, hitherto resisted the voice of the unification charmer.

It is hardly necessary to say that these delights under the regimental system proved, before many months, "honey in the mouth but bitterness in the belly," and that the student, on achieving the manhood of his intellect, had good reason to regret that he had run so far out of his way after a butterfly, and become—as most of the senior and more experienced army surgeons are—zealous disciples of unification.

To such a pass has this ridiculous aping of combatant swellism been pushed, that there are some who express the opinion that regimentalism ought to be kept alive, if only as a school for medical military manners and deportment, their most exalted notion of an army doctor being that he should be a coxcomb, trained to the fashionable mess-room slang, and thoroughly ashamed of his profession—a master of that repose of manner which in civilian circles would be called silliness, and which does not conduce to the efficient discharge of medical military duty.

Our idea (and apparently that of Dr. Evatt) is quite different. We should like to see army surgeons gentlemen in tastes, in intelligence, and education, as well as in deportment; competent and earnest officers, joined in a close social and professional brotherhood, and able to maintain their position towards their combatant colleagues with dignity and on equality.

We cannot doubt that such a condition of things would more probably arise under a unified medical department than under the old regimental system; and if so, we bid welcome to the new era.

---

Last week's returns of deaths from diseases of the zymotic class showed that scarlet fever, measles, whooping-cough, and fever were fatally prevalent in Salford. Scarlet fever was also excessive in Newcastle-upon-Tyne, Oldham, and Sunderland. The deaths from fever were proportionally most numerous in Portsmouth, and those from whooping-cough in Manchester. Small-pox caused 17 more deaths in London, 22 in Dublin, but not one in any of the other large towns.

## THE CONJOINT SCHEME.

Now that there is a probability of the Conjoint Board becoming ere long an accomplished fact, we may as well draw the reader's attention to the recently issued Report of the Committee of Reference with regard to the proposed regulations relating to the professional education and examination of candidates.

First as regards education: the candidate must produce evidence of having passed, before the commencement of professional study, a preliminary examination on subjects of general education; of having been registered as a medical student at least forty-five months previously to his final professional examination; of having been engaged in professional studies for the same time, during which not less than three winter and two summer sessions shall have been passed at some recognised medical school, and of having attended certain courses of lectures on the different subjects on which he will be examined. One winter session and two summer sessions may be passed by attending the practice of some recognised hospital or dispensary, or by receiving instruction as a pupil of some duly registered practitioner, or by attending lectures on any of the required subjects of professional study at a duly recognised place of instruction. With regard to the general curriculum of studies, the proposed regulations differ very little from those that are at present enjoined by the English licensing bodies, and are such as, if duly complied with, will give the future student ample opportunities of becoming practically acquainted with every department of his profession. The proposed curriculum is not unduly weighted with compulsory attendance upon lectures, while it re-

quires evidence of the student having received practical instruction in those subjects which, from an educational point of view, were formerly much neglected. And to prevent the attendance upon lectures being of a mere nominal nature, the Committee of Reference have added a rider to their regulations, to the effect that "the certificates of attendance on the several courses of lectures must *include evidence that the student has attended the examinations in each course.*"

As respects the Conjoint Board Examinations, it is resolved that there should be three—the *first*, on chemistry, materia medica, medical botany, pharmacy, and osteology; the *second*, on anatomy and physiology; and the *third*, on medicine, surgery, and midwifery. The student will be admitted to the first of these examinations within twelve months from his being registered as a medical student; to the second, after he has had eighteen months of professional study; and to the third or final examination, after he has completed his 21st year of age, passed the second examination, and studied medicine, surgery, and midwifery, in accordance with the required regulations. The motive of thus dividing the examinations is obvious, as by this means it is expected the student will have some incentive to work during the whole curriculum instead of leading, as many used to do, everything to the last, and cramming for a few months before one final examination. There are, however, two disadvantages attending this plan. In the first place, the student will be apt to imagine that he is "walking" the hospitals more with the view of passing certain examinations than of becoming thoroughly and practically acquainted with his duties as a medical practitioner. And in the second place, after having satisfied his examiners in the subjects of one examination he will be too ready to throw those subjects aside and to think no more about them. The first objection is of course inseparable from the principle of division adopted by the Board, but the second might be obviated by adding to the proposed regulations a clause informing the candidate, for the second and third examinations, that his examiner shall not be precluded from putting one or two questions on the subjects on which he has been previously examined.

Every candidate, male or female, who has passed the third examination of the Board, will be entitled to receive the licence of either, or all of the three English Licensing Bodies—namely, that of the College of Physicians, of the College of Surgeons, and the Society of Apothecaries.

We have said that the Conjoint Scheme is likely to be carried out before the end of the current year. But this desirable event will depend upon whether the Medical Acts Amendment Bill is passed this session of Parliament, and whether the scheme is made compulsory for each division of the United Kingdom. No doubt there will be fresh obstruction put in the way of passing the Bill, especially by those who are anxious that it should embrace provisions for the immediate reconstruction of the Medical Council. As the opposition of the Scotch corporations was removed last session nothing now stands in the way of the Bill receiving the sanction of the Legislature but this proposed reconstruction of the Council. Perhaps the Government will comply with the wishes of a large section of the profession who are anxious to see the great body of general practitioners more directly represented in the Council than they are at present, or a Bill may be passed in which the reform of the Council is left for future consideration. In either case the establishment of a Conjoint Board would be secured and one great step taken towards improving the status and education of the future medical practitioner. Should, however, any further hitch or delay occur in the passing of the Bill, there will be very little chance of a Conjoint Board being formed for some time to come; perhaps not until the Government takes the matter entirely into its own hands and institutes a State examination.

## THE PLAGUE.—II.

We left off by remarking that a glance at the history of the plague will show that its re-appearance in Western Europe, or even in this country, is not an impossible event. "Given," says a writer on hygiene, "a tropical summer, a cargo of plague-stricken passengers, and an unhealthy, badly managed port, the plague may yet be revived;" and, as we shall presently see, many cities, after a long period of immunity, have been visited and almost decimated by fatal epidemics of this disease.

There can be no doubt that the origin of plagues is lost in very remote antiquity. The plagues of Egypt, described in the ninth chapter of Exodus, carry us as far back as 1491 B.C. According to Baronius, a plague occurred at Carthage, 534 B.C., which was of so terrible a nature that the people sacrificed their children to appease the gods. There was the great plague in Athens, 450 B.C., so graphically described by Thucydides, and another mentioned by Pliny, which raged in the Greek Colonies 188 B.C., and destroyed daily 2,000 of the inhabitants. During the first three centuries of the Christian era several plagues ravaged the Roman Empire. It is, however, doubtful whether these plagues were identical with those that have appeared in more recent times. Probably some of them were, while others were epidemics of malignant typhus, or some other disease. The earliest notice of the true plague to be found in the writings of the ancients is by Rufus, preserved in an inedited book of Oribasius. In this work Rufus describes a fatal and pestilential disease accompanied with buboes in the neck, armpits, and thighs, and which was endemic in Libya, Egypt, and Syria. One of the earliest and most memorable of plagues was that which depopulated the Roman Empire in the reign of Justinian. This plague is minutely described by Procopius, a Greek historian of the sixth century. It appears to have somewhat resembled the Great Plague of London; and was so fatal that in Constantinople alone 200,000 of the inhabitants perished. Still more memorable were the great plagues of the 14th, the 16th, and 17th centuries respectively. That known as the *black death* of the 14th century, desolated Asia, Europe, and Africa, and was so dreadful and fatal that "people still preserve the remembrance of it in gloomy traditions." It first appeared in China in 1333, where it is said to have destroyed one-fourth of the population. Thence it spread to the western parts of Asia, to those surrounding the Caspian Sea, to Arabia, Syria, and Egypt, and then to the south-eastern portion of Europe. It

reached Florence in 1348. In the same year it attacked Avignon, and from thence extended northward to France, Germany, England, &c. It raged with great fury in England and Ireland; and in London alone 200 persons were buried daily in the Charterhouse Yard. According to Guy de Chauliac, the plague in Avignon raged for six or eight weeks, "and the pestilential breath of the sick, who vomited blood, caused a terrible contagion far and near, for even the vicinity of the sick was certain death; so that parents abandoned their infected children, and all the ties of kindred were dissolved." Equally terrible is the description given by Boccaccio of the pestilence as it occurred in Florence. It began to show itself in the spring of the year "in a wonderful manner, and different from what it had been in the East, where bleeding at the nose was the fatal prognostic." Here there appeared tumours all over the body, and afterwards purple spots, "in some cases large and few in number, in other less and more numerous, both sorts the usual messengers of death." It was the same in other parts of the Continent. In France many were struck as if by lightning, and died on the spot. The young and the strong were often the first to succumb. In England the distemper was attended, as at Avignon, with spitting of blood, buboes, and carbuncles; and both in England and in France the patients with buboes scarcely survived two or three days.

The fifteenth century was marked by outbreaks of pestilence in this country and in Ireland. London at the beginning, and Oxford about the middle of the century, lost a large portion of their respective populations, while in 1478 a plague raged throughout England which destroyed more people than the continual wars of the fifteen preceding years. In the 16th and 17th centuries the plague again appeared in various parts of Europe. In London it occurred in an epidemic form at five distinct periods from 1593 to 1655, the last of these being the "Great Plague." In the epidemics of 1603 and 1625, upwards of thirty-six thousand and thirty-five thousand people were respectively carried off by them. But besides the recognised plague years, the plague, as a disease, appears at that time to have been seldom absent from this country. In 1656 the pestilence was carried to Naples from Sardinia by a transport with soldiers on board, and raged with such violence that 400,000 of the inhabitants are said to have perished in six months. About this time occurred the Great Plague of London, to which we have already referred. The first two cases occurred in Westminster, whence the disease was conveyed to London. Checked for a time by the winter frosts, it gained ground in spring, and spread with great rapidity during the summer months. An indescribable panic took possession of the people, which, in conjunction with the then filthy and otherwise insanitary condition of the metropolis, greatly increased the mortality. Nothing the authorities did made any impression upon the pestilence. Fires were kept up night and day to purify the air. Infected houses were shut up and marked with a red cross. The dead were buried with all possible despatch. The disease still increased, and did not abate until it had destroyed more than 68,000 of the inhabitants.

Since that time, now more than two centuries, the plague has not been seen in England. Other countries, however, have not been so fortunate. In 1720, the plague appeared at Marseilles, after an immunity of seventy years. It was conveyed to that port in a ship from the Levant, and swept away 60,000 of its inhabitants. A little later (1759), it raged and "made dreaful havoc" in various parts of Syria and Palestine. In 1771, it visited the city of Moscow, after an absence of a century and a-half; while, a few years afterwards, Persia, Egypt, and the Empire of Morocco were also visited, and more or less depopulated by it. In the early part of the present century immense numbers were carried off by the plague in Spain and Gibraltar. That which visited Malta in 1813 is rendered memorable, says a distinguished writer, by the proofs of the introduction of the infection, and by the measures used to arrest it. It had not appeared in Valetta for 137 years, when it was introduced into that town by a vessel from Alexandria, where it was then prevailing. In 1835, the plague was prevalent in Egypt; while, in 1837, a still more fatal epidemic committed great ravages at Smyrna. It is a significant fact, and one to which we shall hereafter refer, that during this last-mentioned epidemic, the plague made the earliest and greatest ravages in the most airy and cleanest quarter, and the latest and the least in the closest, the most dirty, and the most miserable district. In the most unhealthy locality of the city, where several drains and sewers meander through margins of filth, a barrack containing from 1,200 to 1,300 troops, was placed under the most rigid quarantine, with the result that not one person was attacked, although the distemper was raging around them.

We have thus brought down our brief history of the more memorable outbreaks of the pestilence near that period which is comprised in Mr. Netten Ratcliffe's official report of the recent progress of Levantine plague. Mr. Ratcliffe observes "that since the apparent cessation of plague in Egypt in 1844, after several centuries of prevalence there, and in neighbouring countries, eight reappearances of the disease had been recorded in the Levant up to the close of 1874—viz., two in Western Arabia in 1853 and 1873-74 respectively; two in the province of Benzazi Tripoli in 1858-59, and in 1873-74; two in Persian Kurdistan in 1863 and in 1871; and two in Mesopotamia in 1867 and in 1873-74." The last mentioned outbreak was the beginning of a diffusion of plague in the districts bordering the lower course of the Euphrates and Tigris, near the Western frontier of Persia, and north of the Persian Gulf. This epidemic continued till the hot season of 1877, since which no information of its existence in Mesopotamia has been received. An offshoot of this diffusion and a very fatal outbreak of the disease occurred in 1876 in a district of South-western Persia. In December of 1876 a very rapidly fatal plague appeared in two villages of Northern Persia. In March, 1877, the plague broke out in Rescht, a town containing 20,000 inhabitants, and situated near the North-western corner of the Caspian Sea. The malady extended to several villages in the surrounding district, and cases were recorded as late as January, 1878. This town would appear to have been free from the disease since 1830, during which year half

the population was carried off by it. In September, 1877, the plague appeared in Astrabad and the Perso-Afghan frontier, and in January, 1878 in the district of So-ug-Bulak, Persian Kurdistan.

These Official Memoranda of Mr. Netten Ratcliffe, closely correspond with the official report of the Imperial German Sanitary Commission, which we noticed in our last issue. In this report it was stated that the recent outbreak in Astrachan could be traced to what has always been the principal cradle of the epidemic, viz., in the north-western angle of the Persian Empire. Advancing eastward from this district from the Lower Euphrates Valley, near Bagdad, it reached Rescht on the Caspian Sea, in 1877, and from thence extended to Astrachan. But there is this difference between Mr. Netten Ratcliffe's Report and that of the German Commissioners, that whereas Mr. Ratcliffe does not attempt to account for the manner in which the plague extended from one district to the other, the German Reporters intimate that the geographical course of the disease depended upon the intercourse which existed between the inhabitants of the several infected districts. The outbreaks which occurred in the highlands of Aderberdschan (near Mount Ararat) were, they say, intimately connected with similar outbreaks in the Lower Euphrates Valley. The traffic between the Shutes, who live in North-western Persia, and the inhabitants of the Euphrates Valley, and especially the filthy customs and habits of the Mahometan pilgrims and traders, "appear to stand in causal connection with the repeated succession of outbreaks of plague in those regions." So again there is a considerable traffic carried on between Rescht and the Government of Astrachan, as well as with the inhabitants of the Eastern Caucasus. We shall have occasion to refer to these facts when we consider, as we shall do in our next and concluding article, the means that should be adopted to prevent the extension of the disease.

# Notes on Current Topics.

## The College of Physicians and the Plague in Russia.

It has been decided by the President and Council of the Royal College of Physicians to convene a meeting in order to consider what steps may be necessary for the protection of the United Kingdom, in view of the plague now raging in Eastern Europe. Circular letters have been sent out by the secretary appointing Tuesday for a conference at the College. We wonder whether this action of the College of Physicians will be regarded by our contemporaries with as much disapprobation as they have expressed with respect to the precautions taken on the Continent. We doubt whether they are justified in talking of the "irrational" dread which has spread through the Continent, and the "preposterous measures" that have been adopted by foreign governments. We will admit that quarantine is not invariably successful, and that it has been carried to extremes, and often made unnecessarily oppressive. But that is no reason why it should be given up altogether, just because such high authorities as Mr. Simon and Mr. Netten Ratcliffe are prejudiced against it. The history of past epidemics plainly shows that if the plague is to be prevented entering a country or prevented spreading to any great extent (should it gain a footing), some kind of quarantine, maritime or inland, must be adopted. If our authorities offer no obstacle to its introduction into this country, and rely entirely upon cleanliness, and good drainage, they will in our opinion be committing a great mistake. Strict isolation, disinfection, and brief quarantine precautions, as far as they can be carried out, are the means by which we may best prevent, or limit, the introduction and subsequent extension of the plague in this country; and we trust that the conference to be held at the Royal College of Physicians will make these measures a part of their recommendations.

## Medicine and the University of Cambridge.

We have just received a copy of a memorial to the University of Cambridge Commission, claiming the attention of the Commission to the need which exists for the further development of the study and teaching of medical science in the University. The memorial is signed by many of the most distinguished graduates of the University, as well as by other eminent physicians and surgeons; and we feel certain that the object of the memorial will meet with the general approval of the profession.

As the memorialists very justly set forth, in all other European universities the advancement of medical science is recognised as amongst the most important of academical functions, and the study and teaching of it encouraged by larger endowments than any other branch of science. In Cambridge very large encouragement is given to almost every branch of science and literature, except medicine, and even more than this, emoluments already existing have lately been curtailed, as we are informed, by the extinction of certain medical fellowships at Trinity and Caius. Much has indeed been done during the last few years for the promotion of the natural sciences, but no steps have been taken to provide for the more extended and complete study and teaching of the sciences of pathology, medicine, and surgery.

We certainly agree with the memorialists in thinking that the foundation of a professorship of pathology would meet a pressing and obvious want, and would redound greatly to the honour and reputation of the University.

## Sunday Morning Milk.

Mr. Dupre, the President of the Society of Public Analysts, in a recent address said, that a case, showing the importance of continuous supervision, had come under his observation. Nine samples of milk were bought one Sunday morning, and brought to him for analysis. Out of these nine samples two only were fairly good while seven were largely adulterated, two of them consisting of milk and water, in about equal proportions. A fortnight later, nine more samples were bought, but by this time the dealers had taken the alarm, and one sample only was found adulterated. Taking the average for the last two or three years, rather less than one in five has been found adulterated, but these were always bought on week-days, and the above was the first Sunday experiment.

## Irish County Infirmaries.

In a circular recently addressed to the Infirmary surgeons of Ireland, Dr. Brunker, Secretary of the Association of Infirmary Surgeons, informs them that from information which he has obtained, there cannot be any doubt but that (in some form or other, most probably in connection with the proposed new Grand Jury Bill about to be brought into Parliament during the present session by the Government) some enactment will be proposed, which, if passed, will have a most serious effect on the County Infirmaries and their officers, as well as the public. It is believed that it is the intention to place them under the control of the Local Government Board, and, in fact, to connect them with the Poor-law system, or actually to extinguish them, by prohibiting any further grants for their support by the Grand Juries. It is also the intention of Mr. Meldon to bring in a Bill, but he does not propose to connect the infirmaries with the Poor-law system in any way, but will advise the reception of one guinea subscriptions.

We are quite of opinion that a readjustment of the law with reference to county infirmaries in Ireland is urgently needed; but we view with the greatest apprehension any proposition of law which would take these institutions out of the hands of the county gentry and merge them in the same administration as that which manages the workhouses. We cannot look even with toleration upon any scheme which would not recognise the continuance of the infirmaries as institutions totally distinct both in function and in management from the workhouses. The county infirmaries have always had, and still have, abundant work to do for a class of patients who would not hear of going into a workhouse, and who ought not to be humiliated by being driven thither for relief. If the proposal to which Dr. Brunker alludes assumes tangible form, it will be for all those who have a regard for the maintenance of good surgery in the provinces to exercise every influence to prevent its being passed into law.

## Adulteration of Drugs.

The Local Government Board, in its last report, expresses regret that a larger number of samples of drugs have not been submitted to analysis; it is obvious that the use of adulterated drugs may defeat the intentions of the physician, and that the consequences may be exceedingly serious. Of the samples examined, more than one-fifth are reported against, and some of them were far below the standard of the British Pharmacopœia. There was one case in which suspicion was aroused by the death of two dogs, to which medicine bought as jalap had been administered, and an analysis showed that two-thirds of the so-called jalap consisted of strychnine.

## The Tyrone County Infirmary.

Dr. Thompson, surgeon to the Omagh Infirmary, in presenting a very successful report to his Board of Governors says:—

"The legislation which has year by year threatened the very life of the Irish county infirmaries is still in abeyance, and instead of gaining force, as most projects do possessing any inherent strength or life, has, on the contrary, lost ground. That some change in the present law respecting infirmaries is required no one will deny. The legislation necessary, however, is a Bill to consolidate and place upon a firmer footing institutions which I unhesitatingly assert are more useful and do far more solid good than any others in the country. The contemplated Bill, therefore, should be one founded on principles of justice and common sense. The first clause of an Infirmary Bill should be provision for a fair endowment. This would relieve county taxation, and be very acceptable to the cesspayers. The second clause should bring the infirmaries under the Local Government Board, or of a board composed—as in the case of the asylums—of two medical inspectors, which would be even a better arrangement. As county institutions they would, of course, be independent of the Board of Guardians. Other clauses should provide for a proper audit of accounts; for the constitution of a governing body, which might with advantage remain as at present; for the proper remuneration and superannuation of the surgeon and other officials; and for the repeal of the old Infirmary Bill, with its outlandish and century-old provisions.

"Every year the great amount of good effected by the Irish infirmaries is becoming more apparent, and it is now generally conceded, not only that it is a necessity to have in each county at least one well-provided hospital for the treatment of severe cases of injury and disease, but also as a matter of common fairness that the respectable farmers, traders, shop assistants, servants, &c., should have some place of shelter when overtaken by severe illness, and not be compelled to frequent the workhouse hospitals, institutions no doubt admirable in many respects, but very generally repugnant to the feelings of the better class of our people.

"The strongest argument, therefore, in favour of the infirmaries must always be their usefulness, and I appeal with confidence to the subjoined report as an evidence of the extent of good they effect, and the amount of human suffering and misery they are able to mitigate."

We understand that the Board of Governors is so well satisfied with the efficient working of the institution that it has unanimously voted to Dr. Thompson an increase of salary of £75 a year.

## The General Medical Council Office.

The *Students' Journal* hears, with surprise, that Messrs. Bell and Roope, who for the period of about eighteen years have acted as clerks in the Medical Registration Office, have received notice that their services will be no longer required. Since the Dental Registration Act came into operation, the additional work thrown upon them has been something enormous, all of which has been cheerfully performed, and that, too, without any increase to their salary. After such long service, we should have expected that the Medical Council would have allowed them a handsome retiring pension, as is customary in all public offices; but we understand that they are only to receive a part of their salary for a very limited period. If this is true, it is wholly unworthy of a high and honourable body, such as the General Medical is, or rather should be. This is a subject calling for strong language, but we forbear, simply leaving the matter to the consciences of the individual members of the Council. How different has Mr. Miller, the registrar, been treated. Although only recently appointed to the office, he has been voted an honorarium of a hundred pounds, or a hundred guineas, in consideration of the additional work imposed on him by the Dental Registration Act, the bulk of which, by the way, fell upon the shoulders of Messrs. Bell and Roope.

## The Plague.

In the face of that unreasonable alarm, amounting almost to a panic in several continental countries, it is refreshing to turn to the common sense views propounded by that eminent sanitarian, Dr. Decaisne, in our Paris contemporary, *La France*, of Sunday last. In an exhaustive communication he endeavours to put the public on their guard against panic, and concludes, from good medical authorities, that there is no fear of the pestilence, if such it be, invading Western Europe. He quotes the opinion of Dr. A. Fauvel, head sanitary inspector in France, who says that the malady which now reigns in certain parts of Russia arises from famine and uncleanliness, and that such maladies rarely spread beyond their immediate centres, especially when the proper sanitary precautions are taken. These facts in connection with the precautions already taken by the various European Governments, should have a reassuring tendency, and allay those fears, which, if prolonged, are capable of producing serious consequences on the minds and health of their possessors.

## The Surgeoncy of the Westmoreland Lock Hospital, Dublin,

Which was vacated by the death of the late Dr. B. F. McDowell, is likely to be the subject of an animated contest. The Board of Governors, who are the electors, have fixed the 1st of March for the choice of Dr. McDowell's successor, and also of an apothecary to the institution. They have also recognised Dr. Rawdon Macnamara's succession to the senior surgeoncy by voting to him the additional salary of that office. The salary of the appointment now vacant is £100 a year, and there are, as might be anticipated, many candidates, of whom the following have been publicly named: Dr. Hepburn, who has been doing the duty for some time since Dr. McDowell's illness; Drs. Thomson and Corley, of the Richmond Hospital; Dr. Peele; Drs. Collins and Kelly, of Jervis Street Hospital; Dr. F. McDowell, and Dr. Carroll, son of Sir William Carroll; Dr. R. P. White, Surgeon to the Meath Hospital, and Dr. Fitzgibbon, Surgeon to the City of Dublin Hospital.

## The Medical Registrarship of the School of Physic in Ireland

Which, as we stated recently, was vacated by the resignation of the Rev. Dr. Haughton, has now devolved upon a committee of which Professor Haughton is chairman. Professors MacAlister, Sinclair, Reynolds, and Bennett constitute the committee, and a secretary has been appointed on a salary.

The quarterly report of the Medical Officer of Health for Hastings is to hand, and shows the sanitary state of that favourite health-resort to be most satisfactory. The death-rate during 1878 was 16 per 1,000 of the population, including those of visitors, who are frequently sent here in the last stages of phthisis and other diseases. The sanitory authorities may also be congratulated upon the improved water supply and other desirable reforms, which we pointed out as blots upon the sanitary escutcheon of a watering place some two or three years ago.

## A Dispensary Veteran.

Dr. White, the Dispensary Medical officer of Borris-in-Ossory, in the Queen's County, has resigned his office in consequence of age and impaired health. His Dispensary Committee therefore resolved to recommend the grant of full superannuation allowance.

Dr. White has held the office for forty-one years, and for thirty-eight years has never had a day's leave of absence or required the payment of a substitute for one hour. Certainly, Dr. White's repose from his labours, and any pension he can receive, will have been well earned. We should suppose that forty-one long-drawn-out years in an Irish dispensary ought to qualify anyone for promotion to a higher sphere of reward than the Board of Guardians can give.

## Barrington's Hospital, Limerick.

At the last meeting of the governors of the above splendid hospital, which was presented as a free gift to the citizens of Limerick by the Barrington family, it was stated that if it did not receive more liberal support the doors of the institution would have to be closed. The hospital was built in 1829 by Sir Joseph Barrington and his sons, and presented to the city, since which date 13,102 cases had been treated in the hospital, or on an average about 280 yearly. For many years the Corporation gave a grant of £400 yearly in aid of the funds, but many years ago the grant was discontinued, and although several attempts had been made to revive the grant they had not proved successful.

The rates of mortality per 1,000 of the population last week in the principal large cities and towns of the United Kingdom were :—Leicester 22, Nottingham 22, Newcastle-on-Tyne 22, Sheffield 22, Plymouth 23, Portsmouth 24, Norwich 25, Bristol 25, Sunderland 26, Bradford 26, Leeds 26, London 27, Glasgow 27, Edinburgh 28, Hull 28, Oldham 30, Brighton 30, Birmingham 30, Wolverhampton 36, Salford 38, Manchester 40, Liverpool 41, and the highest rate of all, Dublin 50.

The rates of mortality in the principal foreign cities, according to the most recent weekly returns were in Calcutta 50, Madras 42; Paris 27; Geneva 26; Brussels 36; Copenhagen 23; Stockholm 22; Christiania 23; St. Petersburgh 46; Berlin 27, Hamburg 27, Dresden 26, Breslau 28, Munich 33; Vienna 30, Buda-Pesth 39; Rome 30, Turin 34; Alexandria 34; New York 27, Brooklyn 21, Philadelphia 21, and Baltimore 23, per 1,000 of the various populations.

The centenary of the great chemist Sir Humphry Davy was celebrated in St. John's Hall, Penzance, on Thursday last, by an exhibition of scientific apparatus illustrative of his labours and discoveries. Lectures were delivered in explanation of the objects exhibited. On the exhibition be opened, Mr. Ross, the Mayor of Penzance, telegraphed to Professor Tyndall, and he replied congratulating the Mayor on the steps taken by the people of Penzance to honour the memory of their illustrious townsman.

Amongst the bequests under the will of the late Georg e

Smith Rotheram, Esq., of Blackrock, co. Dublin, who died on the 26th Dec., 1878, are the following—the Hospital for Incurables, Donnybrook, £1,000, the Adelaide Hospital, £1,000; the Convalescent Home, Stillorgan, £1,000; the City of Dublin Hospital, £500; and the Meath Hospital, £500.

---

The Cantor Lectures of the Society of Arts are to be delivered by Dr. W. H. Corfield, M.A., on "Dwelling Houses—their Sanitary Construction and Arrangements." The first lecture was delivered on the 17th inst., on the "Situation and Structure of House, Drainage of Soil, Foundations, Walls, Roofs, Rain-Water Pipes, &c."

---

The *Broad Arrow* understands that provision is made in the forthcoming Army Estimates for carrying into effect the greater part of the recommendations of the recent War Office Report on the Army Medical Department, as published in our columns, and it remains to be seen what effect the increased bonuses on retirement will have in attracting new recruits to the department.

---

It is stated that there has been a serious split among the Spiritualists, which has led to the resignation of over twenty members, among whom are the hon. secretary, the secretary, one of the vice-presidents, and several members of the council.

---

The bust of Mr. John Simon, C.B., F.R.S., the President of the Royal College of Surgeons, was officially presented to the members of the College after the delivery of the Hunterian Oration on Friday last.

---

For the information of those gentlemen who, at the present time, are anxious to go out to the Zulu war as dressers, the *Students' Journal* states, upon the very best authority, that the Red Cross Society do not intend to send out any assistants to the Army Medical Corps.

---

# Scotland.

Dr. Ramsay Ritchie, of Broughty Ferry, died at his residence at Broughty Ferry, on Friday the 7th inst. Dr. Ritchie was a native of Edinburgh, and went to the Ferry about ten years ago as assistant to his uncle, Dr. Ramsay, on whose death he succeeded to an extensive practice. Dr. Ritchie was widely known and much respected.

Glasgow Death Rate.—The mortality during the week ending Saturday the 8th inst., was at the rate of 27 per 1,000 per annum, against 29 in the preceding week, and 30, 27, and 26 in the corresponding periods of 1878, 1877, and 1876.

Health of Edinburgh.—The mortality last week rose from 104 to 114, and the death rate was 27 per 1,000; 68 deaths were due to diseases of the chest, and 39 occurred above 60 years of age. The zymotic mortality continues low. Of the 135 births 19 were illegitimate.

Obstetric Inventions.—Inventive genius seems to be much exercised at the present time in the modification and invention of new obstetrical applications. The battle of the "bags" seems to be bearing fruit. In the pages of a contemporary a "new tractor for obstetric forceps" is depicted by a Dublin obstetrician. It is certainly clumsy and dangerous enough looking, but in these respects it sinks into insignificance in comparison with the new forceps recently brought under the notice of the profession by Drs. W. L. Reid and Whittaker, of Glasgow. The proportions and shape of the former are perfectly antediluvian, and those of the latter may be described as "confused inventive genius, in mistaken hostility to maternal and infantile life." These forceps are not likely to come into use during, at least, the next century. Dr. Bell (but that is no matter for wonder) has also caught the craze for "something new" in his field.

Jubilee of Dr. Simpson, of Fintry.—At a crowded soirée on Saturday, the 8th inst., held in Stewart's School, Fintry, Dr. Simpson was presented with a silver salver, bearing a suitable inscription, and a purse containing £120, and Mrs. Simpson with an elegant silver claret-jug, these gifts being tendered as a jubilee thank-offering for many good services rendered to the families of the donors by this venerable medical man, who in September last completed the fiftieth year of his professional labours in the district.

Cambuslang: Prevalence of Typhoid Fever.—A large number of cases of typhoid fever is reported, and the epidemic is now assuming a serious aspect in the village. The local authority have instructed their medical officer, Dr. Turnbull, to make a strict examination of the infected district, with the view of having every case attended to as it occurs, and getting the parties at once removed to the fever hospital. Only one fatal case is yet reported, but whole families are prostrated with the disease.

Edinburgh Philosophical Institution.—Prof. Williamson, of Owens College, Manchester, delivered on Feb. 11 the first of two lectures on "The Early Forms of Plant Life," to the members of the Philosophical Institution. At the commencement of his subject he reminded the audience that it was found to be a law in nature that any object, however insignificant it might be, was in its full and perfect development a permanent representative of some other object which was merely a temporary condition of an organism designed to develope itself into a much higher form. Some objects were stopped short before they get much beyond their original form; others were developed until they attained the human form, or the form of those oaks and elms which were the pride of the country. Thirty years ago, he next showed, the lowest form of life known was what was called a cell, a microscopic atom with an outer wall, almost as thin as a soap-bubble, enclosing in its interior a protoplasm. Now, however, they had got beyond this in knowledge, because they knew what the cell was produced by. The protoplasm, it was found, had the power of multiplying itself; and then sooner or later, in nearly every instance, this atom threw off a film or membrane with which it encased itself, thus forming the cell. Illustrating his remarks by reference to diagrams, Prof. Williamson pointed out in the remainder of the lecture how the fissures or ruptures that took place in the cells in question acting on different planes, sometimes from north to south, sometimes from east to west, and sometimes horizontally, actually ruled the ultimate forms assumed by the important objects in the plant kingdom.—On the 14th inst., Professor Williamson delivered his second lecture on "The Early Forms of Plant Life" to this Society. He pointed out that green plants acted as atmospheric purifiers, while those containing no chlorophyll did nothing in that direction. Alluding to spontaneous generation, he asked had organisms the power of becoming generated out of chemical materials by the simple action of physical forces?

Could life be produced without the agency of pre-existing life? The evidence, he said, was not clear, whilst there was every reason for rejecting the doctrine of spontaneous generation. The lecture was illustrated by a collection of beautiful diagrams.

UNIVERSITY OF ST. ANDREWS.—The Senatus Academicus of the University of St. Andrews has conferred the Honorary Degree of Doctor of Laws on the following gentlemen :—Evelyn Abbott, M.A., Fellow and Tutor of Balliol College, Oxford; Robert Armstrong, Head English Master, Madras College, St. Andrews; Rev. Augustus Stopford Brooke, M.A., Bedford Chapel, Bloomsbury; James Crichton Browne, M.D., London, Editor of *Brain;* John D. Philbrick, Director-General of Education, Massachusetts; James Young, Esq., of Killy.

DR. CRICHTON BROWNE, whose name is found in the foregoing list of newly created Doctors of Laws, is a distinguished Graduate in Medicine of the University of Edinburgh. He has devoted himself with much ardour and success to the study of insanity. His memoirs and papers on psychological medicine, in this and other journals, are numerous and valuable, and are characterised by great ingenuity, originality, and suggestiveness. Although still young, Dr. Browne is at the head of his department, and an acknowledged leader in his own speciality. He is the founder and joint-editor of *Brain*, a quarterly journal of neurology. He is also the founder and late editor of "The West-Riding Asylum Reports."

THE ZULU DISASTER.—Surgeon-Major Peter Shepherd, who was killed in the disastrous fight with the Zulus last month, was a native of Craigievar, Aberdeenshire. His father was in early life a gamekeeper, and latterly a farmer in Leochel-Cushnie. Dr. Shepherd was a diligent student, and a successful army surgeon. While in London he wrote a manual for the St. John's Ambulance Society, of which we hear many thousands have been sold. He also gave instruction to members of the police force and others as to the treatment of wounds, accidents, &c., and was a most popular and useful officer.

PARLIAMENTARY REPRESENTATION OF THE UNIVERSITIES OF GLASGOW AND ABERDEEN.—At a meeting of the liberal electors of these Universities, held in Glasgow on the 14th inst., among other motions carried was one that Dr. Andrew Clark be asked to contest the seat with Lord Advocate Watson, its present holder. Without expressing an opinion politically, Dr. Clark would do honour to any constituency; he is a man of considerable administrative ability, an exceedingly able speaker, and a gentleman. We are, however, disposed to doubt the rumour that he has accepted the proposal, as the serious question of time must enter into the calculation of one in the possession of perhaps the largest and most lucrative practice in London.

MINTO HOUSE MEDICAL SCHOOL.—The following lecturers were appointed on Friday last to the New Medical School in Chambers Street :—Dr. Symington, Anatomy; Dr. Craig, Materia Medica; Mr. Daniell, M.A., B.Sc., Medical Physics; Dr. Waller, Pathology; Dr. Kirk Duncanson, Diseases of the Ear; Dr. Jamieson, Skin Diseases; Dr. Halliday Croom, Midwifery. The following had previously been appointed :—Dr. Wylie, Practice of Medicine; Dr. Angus McDonald, Midwifery; Dr. Aubery Husband, Medical Jurisprudence and Public Health; Mr. Cheyne, Surgery; Mr. J. Falconer King, Chemistry. Physiology, Botany, and Natural History remain to be filled.

# Obituary.

## DR. JACOB BIGELOW, OF BOSTON, U.S.

DR. JACOB BIGELOW, of Boston, U.S., died at his residence in Boston, on January 10th, at the age of ninety-one years. He was the oldest member of the Massachusetts Medical Society, and one of a group of prominent men whose lives are intimately connected with the early history of medicine in America. Born but a few years after the American Revolution, and graduated at Harvard in the class of 1806, his literary career began as early as 1814, with a work on botany, entitled "Florula Bostoniensis," which, to this day, is the most complete work of its kind, and the standard authority. He was already a professor in 1815, and a few years later his beautiful plates of American Medical Botany made their appearance His early lectures on the application of science to the useful arts gave a bent to his tastes and views, which ultimately terminated in his participation in the inauguration of the Institute of Technology.

## DR. RICHARD H. CROSS, OF NEWTOWNARDS.

THIS gentleman died on Saturday morning, the 8th inst., at his residence, Newtownards. Deceased ranked as surgeon-major of the North Down Rifles from March, 1873. Dr. Cross was a native of Strangford.

## DR. BANKS, OF DONEGAL.

IT is with much regret that we announce the death, at a very early age, of Alfred Banks, Esq., M.B., T.C.D., late medical officer of Donegal Dispensary District, which sad event took place on the 7th inst., at the Vicarage, Donegal. Deceased, who was only in his 29th year, met his untimely death in the discharge of his duty, and was the youngest son of Benjamin Banks, Esq., the kindly and able secretary to the Local Government Board for Ireland. Dr. Banks was remarkably clever as a student and a physician, and had entered upon the medicaj profession at an unusually early age, and had Providence willed it otherwise, no doubt a high position awaited him amongst the members of the "healing art," upon which calling he had but a few years entered.

# Literary Notes and Gossip.

THE list of new medical works and new editions issued during the past few weeks, shows considerable literary activity. Owing to the pressure upon other portions of our space, we have been unable to keep pace in the department of reviews. We have had in type for several weeks past, reviews of the second volume of "Gant's Surgery," "Berkart's Asthma," and others, for which we hope to find space shortly. During the present "rush" we must crave the indulgence of our authors.

* * *

*House and Home* is the name of a new weekly penny journal. It is dedicated to all classes, and is devoted to overcrowding, improved dwellings, hygiene, building societies, dietetics, and domestic economy generally.

* * *

DR. MACLAGAN'S thoughtful book, the "Germ Theory o Disease," is being advertised in the medical journals with extracts of three criticisms from the *Medical Examiner*, the *British and Foreign Medico-Chirurgical Review*, and *Public Health*. By a curious coincidence, these three journals are now "numbered with the dead."

* * *

Dr. MCEWEN, Surgeon to the Glasgow Royal Infirmary, has issued in a separate form his paper on "the Diagnosis of Alcoholic Coma." The main argument might have been stated in a third of the space; but the paper will repay perusal by juniors.

* * *

Dr. WOODBURN, of Glasgow, has in a local newspaper exposed alleged "Novelties in Dentistry." Tooth-grafting, he has shown, "is neither peculiarly French, nor even can it bear the stamp of any nationality except British, for our own John Hunter was, the first to write on the practicability of tooth-grafting."

* * *

Dr. BARR has issued in pamphlet form his opening Address to the students attending the Aural Clinique at the Glasgow Western Infirmary. The style is ponderous, and the author's views of the anatomy of the internal ear are not in harmony with those of the best authorities.

* * *

A REVIEWER when reading, or even casually glancing through the pages of a new book, cannot but be sometimes struck with the numerous typographical and grammatical errors which occur. As an instance of this kind of carelessness, we may cite Eulenberg and Guttmann's "Physiology and Pathology of the Sympathetic Nerves," translated by Dr. Napier, just to hand. At the end of which—a *brochure* of only 141 pages—there are errata of no less than 155 lines of closely printed type. It would of course, be unfair to expect perfection in book making, more than in aught else human; but really such a string of errors as this is inexcusable.

* * *

THAT curious little book which was issued last year under the title of "Medical Men and Manners of the Nineteenth Century," has reached the third thousand, and is now before us in a much enlarged form. On a former reading it was the source of both pleasure and pain: pleasure, with the sparkling humour which ever and anon adorns its pages; pain, with the many social blots and the miserable squabbles on which the author puts his finger, with the evident knowledge, that to reform, is to reveal unpleasant truths; and to do either is an uphill game. But the writer is never dull, and though under anonymous authorship, we feel certain he must be an Irishman for his genuine *bon hommie* "after the manner born," crops up at every serious moment.

* * *

As expressing the objects and style of "Medical Men and Manners" before referred to, the following quotation must suffice, premising that most of our readers will be glad to wile away a leisure hour in the perusal of its well-stored pages, of historical information. "As I am not (thank God) either lawyer or theologian, I shall, as far as possible, eschew the affairs of both, and leave lawyers, and their laws to the criticisms of some 'honest attorney' or conscience stricken barrister, who, after he has amassed a fortune in fees he never worked for, shall publish his confessions, repentance, and prophylactics for the evil, as affecting succeeding generations. Being a medical man, my present affair is the reform of medicine. If the attempt be not successful, I, after the fashion of greatermen, will politely bow my exit, and leave the enlightenment of the world to other performers."

* * *

AMONGST the Government measures to be brought forward early in the present Session of Parliament, is one to revise the copyright laws, based to a considerable extent upon the recommendations of the Royal Commission. Authors will hail this news with pleasure, though we doubt if America—the great thorn in our side for piracy—will agree to any terms which prohibit the appropriation of an author's brains without acknowledgment or reward.

* * *

THE "International Medical Journal," which was to have appeared in November last, simultaneously in England and Germany in the two languages, has not yet made its *debut*; we presume in view of so many failures in medical journalism of late, its proprietors have altered their minds. If so, we congratulate them. Another stoppage is announced; viz., the *Deutsche Zeitschrift für praktische Medicin*. This was begun years ago by Kunze, and since his death edited by Dr. B. Fraenkel, of Berlin, it has, however, been gradually declining in interest, and will not again appear.

* * *

SPEAKING of British journalism, especially in reference to the demise of the *Doctor*, the *Cincinnati Lancet and Clinic* says: "The British field now contains four old established weeklies: The *Lancet*, the *Medical Press and Circular*, the *British Medical Journal*, and the *Medical Times and Gazette*. With such powerful competitors as these, it is extremely unlikely that a new weekly will be ventured upon. Publishers will not soon forget the fate of the *Medical Examiner*, which perished in 1878, after a life of two years, during which, we are informed, nearly one hundred thousand dollars were sunk in the enterprise."

## THE GENERAL MEDICAL COUNCIL.

IT will be recollected that in the month of June, 1878, the General Medical Council was threatened with a very alarming invasion. The Duke of Richmond's Bill was then on the tapis, and the Bill of the British Medical Association was standing for its second reading, and would have been pressed forward by Messrs. Mills and Childers for the purpose of forcing direct representation upon the General Medical Council, if that body had not come to a compromise with the medical reformers. To escape the possible contingency of a compulsory reform the Council was driven to give a promise that, if spared another year, it would see about setting its house in order. Every one felt that that promise was unwillingly given, and would be evaded ,if possible, and, in fact, that the Council was not to be trusted to keep it; and, therefore, a further pledge was forced from it, that it would consider the question at its "first meeting," and that it would make up its mind on the subject, and communicate its views to Parliament before the commencement of the 1879 Session. We need not recapitulate how the Council deliberately falsified its promise, and shuffled out of its engagement upon the plea that its "first meeting," held last October, was not its "first meeting." Having so excused its breach of faith it postponed the question of reform to a special meeting, which it was pledged to hold before the meeting of Parliament; and in the meanwhile, the Executive Committee was to investigate the propositions for reconstruction, and to have its report ready.

It was not to be expected that the Executive Committee would set itself to its duty with any honesty of purpose, for it was well known that its cherished object was to defeat the reform of the Council by any or every means. No one was much interested in its deliberations, for every one felt certain that its report would be devised so as to obstruct direct representation. As a matter of fact it has leaked out that the report agreed upon proposes a patching up of the Council, which would not be listened to by the profession for a moment.

But it was at least hoped that the Executive Committee would confine its obstructiveness to its report, and would not dishonour itself and the Council by causing that body to break its word a second time. Yet it seems that hope was illusory. Parliament has met. The time when the Council should have discussed the question and reported to Government has passed by, and the pledge given last June remains unfulfilled.

The Executive Committee is, no doubt, delighted with its own cleverness in shuffling out of its promises, and so are we, for we look upon the attitude of the Council and its Committee as the strongest weapon in the hands of reformers. Its unreadiness for improvement, its insensibility to the feelings of the profession and the public, and its disregard for its own honour and truthfulness, are so apparent that even its apologists have not a word to say against peremptory reconstruction. The Government cannot fail to see that there is truth in the indictment against the Council. The public cannot fail to see that the Council is obstructive, and—to the last degree—unfit for the management of medical affairs, and the reformers are confirmed in their belief that compromise with its members is impossible. If the Council had pretended willingness to be reformed, and had suggested a half measure, it might have been difficult to force upon it a thorough reformation. Its course of proceeding since June last has relieved the profession and the Government of any scruple on the point, and we hope that when the British Medical Association introduces its Bill it will push it forward without any regard for the views of the Medical Council.

## THE VACANCY IN THE COUNCIL OF THE IRISH COLLEGE OF SURGEONS,

Caused by the death of the late Dr. B. F. McDowell, is to be filled by the Fellows on the 25th inst. The candidates at present in the field for it are Dr. Brunker, formerly Surgeon to the Dundalk County Infirmary, now of Dublin; Mr. Swanzy, Professor of Ophthalmic Surgery in the College; Dr. Bennett, Professor of Surgery in the School of Physic; Dr. Madden, Deputy-Surgeon General; and Mr. John Baker, a Dental Surgeon and Fellow of the College.

## EXAMINERSHIP AND CURATORSHIP IN THE IRISH COLLEGE OF SURGEONS.

THE death of the late Dr. John Barker has vacated a seat on the Court of Surgical Examiners of the College. Dr. Barker's subject had been materia medica, and it is probable that the Council would probably attach importance to a due representation of that subject in the examination. But two candidates have as yet announced their intention to compete: Dr. Frazer, formerly Lecturer on that subject in the Carmichael School, and Dr. Kilgarriff, Surgeon to Jervis Street Hospital. The election will be by seven of the Council chosen by lot, and will take place on the 25th inst.

## IRISH INFIRMARY SURGEONS AND PRISONS.

WE learn that our statement of last week to the effect that Dr. Palmer, of Armagh Infirmary, had been appointed to the prison on condition of his compounding the medicines, is not quite correct. Dr. Palmer was appointed without condition or reservation on the 2nd of July, and four months afterwards was informed that his salary would be (so much), provided he compounded the medicine. It will be observed that there is nothing honest, straightforward, or admirable in the proceedings of the Irish Prisons Board. The officer is appointed in order to get him into harness, and then has the additional duty put on him on the implied threat that if contumacious, he would be cut down in payment.

WE understand that His Grace the Lord Lieutenant, has accepted the invitation of Mr. Smyly, President of the Royal College of Surgeons in Ireland, and will honour the College by dining with the President in the College Hall on the 8th of March.

# Medical News.

**The Hnnterian Society.**—At the Annual General Meeting of this Society, held at the London Institution on Wednesday, February 12th, the following gentlemen were elected officers for the ensuing year:—President, J. Braxton Hicks, M.D., F.R.S; Vice Presidents, G. Lichtenberg, M.D., Buxton Shillitoe, F.R.C.S., P. H. Pye-Smith, M.D., and George Roper, M.D.; Treasurer, H. I. Fotherby, M.D; Trustees, H. I. Fotherby, M.D., and D. DeBerdt Hovell, F.R.C.S.; Librarian, P. L. Burchell, M.B.; for the Oration of 1880, P. H. Pye-Smith, M.D.; Secretaries, R. Clement Lucas, B. S., and Stephen Mackenzie, M.D.; Council, F. M. Corner, M.R.C.S., T. B. Crosby, M.D., E. Dukes, M.R.C.S., T. R. Fendick, L.R.C.P., R. Fowler, M.D., James Greenwood, M.D., G. E. Herman, M.D., A. H. Smee, M.R.C.S., G. J. B. Stephens, L.R.C.P., Waren Tay, F.R.C.S., W. C. Tomlin, L.R.C.P., and Stephen Ward, M..D. The Annual Dinnerof the Society took place at the "Albion," on Saturday, thel5th inst., when the retiring president, Dr. Crosby, occupied the chair. He was supported by Professor Owen, the presidents of the Medical, the Clinical, and the Pathological Societies, and other distinguished guests. In replying for the toast of the evening, Professor Owen alluded to the recent outcry against vivisection, and showed how the Hunterian operation for the cure of aneurism was foundedon experiments made for the purpose of studying the development and growth of the stags' antlers.

**Charing Cross Hospital.**—The Fifty-eighth Annual General Court of the Governors of this Hospital was held on Thursday last. The report stated that 1,638 in-patients, and 16,400 out-patients were treated during the year 1878, and that amongst the patients treated were 5,255 cases of accident and emergency. The past year had not been a prosperous one financially, the amount expended having been £508 more than the amount received. The Council had given their earnest attention to the subject of removing the mortuary buildings from the hospital, and providing new and well-arranged premises for the medical school, which was now the one most pressing need of the hospital. The Duke of Bedford, who had visited the wards and expressed his complete satisfaction therewith, had consented to grant a lease of a plot of land opposite to the hospital as a site for the buildings. It was estimated that the total cost, including fittings, would be about £10,000, while for extension purposes the Council had only £5,000 available. If the requisite sum could be provided without delay the buildings would be erected, and the new school opened for the reception of pupils on the 1st October, 1880. It was stated that Lord Overstone, the President and munificent supporter of the Institution, had promised to contribute £1,000 for this purpose.

**Dreadnought Seaman's Hospital Society.**—At the Annual Court of this Society, held on Thursday last, under the presidency of H.R.H. the Duke of Edinburgh, the Secretary proceeded to read portions of the Report of the Committee of Management and the last Statement, from which it appears that the support accorded to the funds of the Society had been generous and hearty. The Queen and the Foreign Governments generally have renewed their annual subscriptions, while the Emperor of Austria and the Crown Prince of Austria have each given a special donation of £20. The Crown Prince of Denmark has also sent a special donation of £15. The Council of the Hospital Sunday Fund have made a grant of £750 during the past year, and the Committee of the Hospital Saturday Fund one of £162 17s. 3d. The total sum received from voluntary contributions during the past year amounted to £7,800, in round numbers, a sum which has been raised by an expenditure of less than 10 per cent. The legacies for the year amounted to £673, only about a third of the average amount received from this source during the last fifteen years. The income from all sources for the year ending December 31, 1878, amounted to £12,770 3s. 1d., and there was an excess of expenditure over ordinary income of £26 2s. 11d.

## NOTICES TO CORRESPONDENTS.

98.—From the 12th July, 1876, when the Royal Warrant was issued, there have been no militia medical appointments. The Warrant says: "Our further will and pleasure is, that no further first appointments of medical officers be made after the date of our present Warrant to that portion of our auxiliary forces called the militia, but that militia medical duties be thenceforth performed under the orders of the Director-General of the Medical Department of the Army."

MR. HY. CARR.—Your book will be noticed in due course.

HARVEIAN SOCIETY.—Thursday, Feb. 19th, at 8½ p.m., Mr. Lennox Browne, "On Chronic Abscess of the Antrum."—Mr. Cripps Lawrence, "On Intermittent Broncho-pneumonia."

THE VACANT SEAT ON THE COUNCIL OF THE R.C.S.I.—Notice is given in our advertising columns that the vacancy created by the death of Dr. B. F. McDowell will be filled on Tuesday next by ballot.

PRISONS APOTHECARIES.—A correspondent who has perused the article in our issue of Feb. 5th relative to the case of the Irish Prisons Board requiring surgeons to gaols to act as apothecaries, suggests that such practice is illegal. He asks, Is it not illegal by the Apothecaries and Pharmaceutical Chemists' Acts for any one not an apothecary or pharmaceutical chemist to compound medicines for remuneration, whether that remuneration is in the shape of cash paid over counter or salary received? The 30th section of the Pharmacy (Ireland) Act says: "It shall be unlawful for any person *to sell or keep open shop for retailing, dispensing, or compounding poisons or medical prescriptions*, unless such person be registered as a pharmaceutical chemist or a chemist and druggist under this Act, or to assume or use the title of pharmaceutical chemist, or pharmaceutist, or pharmacist, or dispensing chemist, or the title of chemist and druggist in any part of Ireland, unless such person shall be registered as a pharmaceutical chemist, or as a chemist and druggist respectively under this Act: provided always, that nothing in this section contained shall affect any licentiate of Apothecaries' Hall, *or any person who shall have been registered as a legally qualified medical practitioner* before the passing of this Act, or who shall be registered as a legally qualified practitioner after the passing of this Act, and who, in order to obtain his diploma, shall have passed an examination in pharmacy."—ED.

PROF. HUMPHRY, Cambridge.—Hunterian Oration received after we had "made up" for press, or we should have had much pleasure in placing it before our readers. We intend devoting an article to its consideration in our next.

DR. CARPENTER.—Bill for presentation to House of Commons to hand—too late for present number. Framers have been either misin-

formed or badly advised on one or two points, which we fear may prove fatal to its success.

THE ANNUAL REPORTS OF THE ROYAL MEDICAL BENEVOLENT FUND SOCIETY OF IRELAND.—The committee are anxious, if possible, to complete some additional sets of this Society's Annual Reports for preservation; for this purpose the following early numbers are wanted; the committee, therefore, solicit the co-operation of the members of the Society to obtain any of these Reports, and forward them to Dr. Marks, 26 Hatch Street, Dublin. The Reports wanted are those for the years 1843 to 1850, and for 1853 and 1858.

DR. PIETRIE, Toulon, is thanked.

DR. CAMPBELL BLACK.—Your short paper on "Calculus in the Female Bladder" will appear in our next.

## VACANCIES.

Ardwick and Ancoat's Dispensary, Manchester.—House Surgeon. Salary, £100, with £20 from Provident Fund. Applications to the Hon. Sec. before Feb. 23.

Ballinrobe Union, Ballinrobe Dispensary.—Medical Officer. Salary, £100, with fees and £25 as Medical Officer of Health. Election, Feb. 27.

Coventry Union.—Medical Officer for No. 2 District. Salary, £63, with the usual extra fees. Applications to the Clerk on or before Feb. 26.

Donaghmore Union, Borris-in-Ossory Dispensary.—Medical Officer. Salary, £100, with fees, &c., and £20 as Sanitary Officer. Election, Feb. 25.

Isle of Thanet.—Medical Superintendent for the Sanatorium, near Ramsgate. Salary, £150, with an allowance of £1 11s. 6d. per week for board. Applications to the Clerk, Board Room, Minster, near Ramsgate, before March 1.

Joint Hospital of Partick, Hillhead, &c.—House Surgeon. Salary, £100, with board. Applications to the Secretary, 180 St. Vincent Street, Glasgow.

Magherafelt Union, Draperstown Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer.

Roscommon County Infirmary.—Apothecary and Registrar. Salary, £60, with apartments and allowances. Election, Feb. 21.

Shillelagh Union, Hacketstown and Coolkenno Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Medical Officer of Health. Election, Feb. 27.

Sligo Union, Riverstown Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Sanitary Officer. Election, Feb. 27.

Tendring Union, Essex.—Medical Officers for Districts 2, 3, 5, 6, 7, 8, 10, 11. For particulars, apply to the Clerk, Union Offices, Manningtree.

Waterford Union, No. 2 Dispensary.—Medical Officer. Salary, £120, with fees, &c., and £25 as Sanitary Officer. Election, Feb. 21.

## Births.

BRABAZON.—Feb. 11, at Lymm, Cheshire, the wife of William P. Brabazon, M.D., of a son.

BROWNE.—Feb. 11, at Dungannon, co. Tyrone, the wife of Thomas J. Browne, M.B., of a daughter.

CLOTHIER.—Feb. 13, at Highgate, N., the wife of Henry Clothier, M.D. Lond., of a daughter.

LITTLE.—Feb. 8, at Spa Hill, co Carlow, the wife of John G. Little, L.R.C.S.I., of a son.

MACSWINEY.—Feb. 12, at Albury Villa, Dover, the wife of Surgeon E. V. MacSwiney, M.D., A.M.D., of a daughter.

## Deaths.

BANKS.—Feb. 7, at Donegal, from typhus fever, Alfred Banks, M.B., aged 28.

BLEWITT.—Feb. 3, at Lostwithiel, John Collins Blewitt, M.R.C.S.E., aged 72.

COURTENAY.—Feb. 10, at Peshawur, India, Surgeon-Major S. C. Courtney, Bengal Army, of tetanus, aged 43.

CROSS.—Feb. 8, at Newtowngrade, co. Down, Richard Hamilton Cross, M.R.C.S.E.

HORE.—Jan. 31, at Croydon, William Hore, M.R.C.S.E., aged 75.

KIERNAN.—Feb. 12, at Enniskillen, co. Fermanagh, James Kiernan, M.D.

MILLER.—Feb. 11, suddenly, at Broomfield, Shandon, N.B., Hugh Miller, M.D., aged 68.

MOLLOY.—Feb. 8, at Castlepollard, co. Westmeath, Henry B. Molloy, L.A.H.D., aged 78.

PAYNE.—Feb. 3, at Norwich, Sturley Payne, M.R.C.S.E., aged 51.

PENKIVIL.—Feb. 3, at Worcester, Richard Savage Penkivil, M.R.C.S.E., aged 67.

RITCHIE.—Feb. 7, at Broughty Ferry, Alex. Ramsay Ritchie, M.D.

SMITH.—Feb. 4, at Regent Terrace, Edinburgh, John Smith, M.D.

THE GENERAL FURNISHING COY

FURNISH ON THE NEWHIRE SYSTEM

Prospectus Post Free.

Offices—9 SOUTHAMPTON ST. STRAND.

Over Thirty Wholesale Houses to Select Goods from.

The "NEW HIRE SYSTEM" is quite distinct from anything yet attempted. Houses, Apartments, Offices, &c., can be furnished throughout without increased yearly expenditure. The Public Press directs the attention of Merchants, Traders, and others to these advantages. Prospectus, with numerous Press Opinions, post-free.

GENERAL FURNISHING COMP., Offices, 9 Southampton St., Strand.

21 PICCADILLY, W.

MR. GEORGE VICKARS,

MEDICAL CONVEYANCER AND PARTNERSHIP AGENT.

Office hours, 10 till 5; Saturdays, 10 till 2.

Transfer of Practices.

Mr. VICKARS begs to inform members of the Medical Profession desirous of disposing of the whole or part of their Practices, that he undertakes their Transfer and the negotiation of Partnerships strictly on Commission terms.

Mr. Vickars begs it to be understood that he takes all risk of expense in the conduct of the negotiations on himself, NO CHARGE WHATEVER BEING MADE TO VENDORS unless their commissions are successfully executed through Mr. Vickars' agency.

INTENDING PURCHASES (to whom in no case is any charge made) are invited to inspect Mr. Vickars' List of Practices for Disposal.

Assistants.

Mr. VICKARS keeps a Register of selected qualified and unqualified Assistants. None but those Gentlemen whose antecedents and characters have been found by personal inquiry to bear the strictest investigation, are placed upon this Register. Principals can consequently be supplied at the shortest possible notice with capable and trustworthy Gentlemen to assist them in their practices, by sending full particulars of their requirements, salary given, &c., to Mr. Vickars.

A fee of Five Shillings, payable in advance, is chargeable to both Principals and Assistants.

All communications are treated in confidence, and meet with prompt attention.

Mr. George Vickars, 21 Piccadilly, W.

TO ASSISTANTS.—GENTLEMEN (qualified and unqualified) desirous of obtaining good Engagements are invited to apply to Mr. George Vickars, personally or by letter. They should be prepared to deposit, for the inspection of principals, their cartes and any testimonials they may possess, which will be returned. Fee Five Shillings, payable in advance, and inclusive of all charges.

Mr. George Vickars, 21 Piccadilly, W.

London, S.W.—£740 a year.—General PRACTICE for Sale producing above amount. Receipts (partly cash) made up by—Private Practice £500, Midwifery £150, Appointments (believed to be transferable) £90. Being disposed of on account of ill-health. Price £500, £400 cash, remainder secured.

Apply to Mr. George Vickars, 21 Piccadilly, W.

London, N.—Good Nucleus. Self-supporting DISPENSARY, producing at present about £3 a week cash, for Disposal. Can be easily and rapidly worked up to £10. Present incumbent unable to attend to it personally. A capital opening for a Gentleman desiring to commence practice. Price, including fixtures, fittings, furniture, drugs, &c., only £80.

Apply to Mr. George Vickars, 21 Piccadilly, W.

Liverpool. — Superior Nucleus in a fashionable and improving neighbourhood. A good middle-class practice, with self-supporting Dispensary (separate entrance) attached. In its second year. Receipts last year £150, three-fourths of which was cash. Fees: Visits, 3s. 6d. and 2s. 6d.; home consultations, 2s. 6d. Superior modern house, with well-fitted Surgery; rent £50. About £100 worth of excellent furniture, which can be purchased or not as desired. Plenty of scope for good-class practice. Incumbent removing to the country. Price for Practice £100; £50 down, remainder by two easy instalments.

Apply to Mr. George Vickars, 21 Piccadilly, W.

Yorkshire. — £300 a year. — A very genuine, easily-worked Country PRACTICE in a pleasant agricultural district of the North Riding. Present incumbent, who is removing to a more extensive Practice, has held it for ten years. Receipts during that time have averaged £300 a year. Last year's takings amounted to £316. Midwifery, about forty-five cases a year, at 15s. and 21s. cash. Bad debts do not reach £5 in the year. Expenses light. Rent of good detached house, with stabling, £29. One horse kept. A lengthened and efficient Introduction can be given. A thoroughly sound investment suitable to a gentleman fond of country life. Price to an immediate purchaser £180; £150 cash, £30 in twelve months if £300 shall be booked during that period.

Apply to Mr. George Vickars, 21 Piccadilly, W.

## SAXON MINERAL WATERS and PASTILLES.

SAXON-LES-BAINS, SWITZERLAND.—Most highly recommended by eminent medical authorities in all cases of Chronic Disease Liver, Skin, &c. (*see pamphlet*).

Prepared by ROBBI & CO., Geneva. Sold by ADOLPHE HUBERT, 344 OXFORD STREET, HILL'S PLACE, LONDON, Sole Agent for England and the Colonies; and all Chemists.

## AERATED LITHIA WATER.—Messrs. BLAKE

SANDFORD, and BLAKE are prepared to supply the LITHIA WATERS (of which they were the original manufacturers under Dr. GARROD'S instruction) of any strength prescribed by the Profession for special cases. Those in constant use contain two grains and five grains in each bottle, either by itself or combined with BICARBONATE of POTASH or PHOSPHATE of AMMONIA. Also POTASH, CITRATE of POTASH, SODA, SELTZER, VICHY, and MINERAL-ACID WATERS, as usual.—BLAKE, SANDFORD, and BLAKE, Pharmaceutical Chemists, 47 PICCADILLY

## BURROWS'
# MALVERN WATERS.

LONDON AGENTS—

E. GALLAIS & CO., 27 Margaret Street, W.

JOHN BELL & CO., Chemists, 338 Oxford Street.

CORBYN & CO., Chemists, 86 Bond Street, 300 High Holborn, and 7 Poultry.

## MINERAL WATERS.

PREPARATIONS by A. AND R. THWAITES AND CO., DUBLIN.

SINGLE SODA WATER.
DOUBLE SODA WATER.
Patent Soda Water.
Kali Water.
(*Single, Double Treble.*)
Potass Water.
(*Strength as in London.*)
Fluid Magnesia. (*Concentrated.*)
Aerated Magnesia Water.
(*Single, Double, Treble.*)
Citrate of Magnesia.
(*Aperient Lemonade.*)
Cheltenham Water.
(*Single, Double, Treble.*)
Lithia Water.
(*Of graduated strength.*)

SELTZER WATER.
(*Supercarbonated.*)
Carbonated Water.
Ammoniaca Soda Water.
Camphorated do.
Bagneres Water.
Rochelle Water.
Seidlitz Water.
Fluid Citrate of Iron.
,, Citrate of Kali
Fluid Camphor.
Salt of Steel, in Packets of 1 *and Grains.*
Brandish's Alkaline Solution
CARRARA.
(*Carbonated Lime Water.*

*All these Waters are prepared with strict attention to Chemical accuracy*

They think it necessary to inform the Public, that the solution of the different salts, on the accuracy of whose proportions the efficacy of the mineral waters depends, is invariably prepared by a member of the firm, and never trusted to any subordinate; and that the knowledge of the chemical processes made use of in their preparations HAS NEVER BEEN entrusted to any person in their employment; nor has it ever been imparted TO ANY PERSON whatever, who prepared Soda Water for Sale.

LEMONADE, LEMON FLAVOURED SODA WATER, GINGER BEER, SPRUCE BEER.

# NATURAL MINERAL WATERS of VALS, APOLLINARIS,

**Hunyadi-Janos, Vichy, Carlsbad, Seltzer, Kissingen, Homburgh, Pullna, Friedrichshall, &c., direct** from the Springs; also the Artificial Mineral Waters prepared by Dr. Struve and Co., at the Royal German Spa, Brighton; R. Ellis & Son, Ruthin; and the Natural Bromo Iodine Water of Woodhall Spa, Lincolnshire.

W. BEST and SONS, 22 Henrietta Street, Cavendish Square, London, W.

The SOUND & BRIGHT. Half-Guinea Ale. IN CASKS AND BOTTLES. SOUND & NUTRITIOUS Nursing Stout.

The AK A GOOD SOUND ALE AT A LOW PRICE FOR FAMILY USE.

Waltham Bros., Brewers, London, S.W.

H. SCHWEITZER & Co., 10 ADAM STREET, LONDON, W.C.

# SCHWEITZER'S COCOATINA.

Anti-dyspeptic Cocoa or Chocolate Powder.

**GUARANTEED PURE SOLUBLE COCOA OF THE FINEST QUALITY**
WITHOUT SUGAR OR ANY ADMIXTURE.

The high degree of SOLUBILITY and PERFECT PURITY attained is *solely* due to the careful manipulation and delicate MECHANICAL treatment of the finest quality of Cocoa Beans, having the *excess* of Fat extracted.
Four times the strength of preparations thickened, yet weakened, with Starch, &c., and in reality cheaper.
Made instantaneously with boiling water. Keeps in all climates. Palatable without milk.

**Adopted as a "Medical Comfort" in all Hospitals and Ships of H. M. Royal Navy.**
Sold in air-tight Tin Packets, at 1s. 6d., 3s., 5s. 6d., &c., by Chemists, Grocers, &c. (Samples free by post.)

# BOUDAULT'S PEPSINE.

The Paris Hospitals have used no other.

PARIS, 1867. MEDAILLE UNIQUE.
HAVRE, 1868. MEDAILLE D'ARGENT.
LYON, 1872. MEDAILLE D'OR
VIENNE, 1873. MEDAILLE DE MERITE.

Since the introduction of Pepsine by BOUDAULT and Dr. L. CORVISART, BOUDAULT'S Preparations have been considered the most reliable.

The Jury of the International Exhibition, Paris, 1867, awarded to BOUDAULT'S Preparations the only Medal given for Pepsine. Since that time it has taken the Medal at each of the International Exhibitions—Havre, Lyons, Vienna.

**Boudault's Pepsine—dose, 5 to 10 grains.**
**Also Neutral Pepsine—Pepsine with Morphia—Pepsine with Strychnia—dose, 5 to 10 grains.**
**Pepsine Wine, in bottles, 4s. and 8s.—dose, a tablespoonful.**
**Pepsine Elixir, in bottles, 4s.—dose, a tablespoonful.**
**Pepsine Lozenges, in bottles, 3s. Pepsine Pills, in bottles, 3s.**

**MOTTOT BOUDAULT, 7 Avenue Victoria, Paris P. & P. W. SQUIRE, 277 Oxford Street, London.**

# IRISH POOR-LAW INTELLIGENCE.

## ATHY PETTY SESSIONS.

IMPORTANT PROSECUTION UNDER THE PUBLIC HEALTH AC

MR. G. TOMLINSON, proprietor of the Nag's Head hotel, Athy, was summoned at the suit of the sanitary authority for keeping open said hotel for the reception of guests contrary to the provisions of the Act 41 and 42 Vic., cap. 52, sec. 144, said hotel being infected with small-pox disease, and for not having taken proper precautions against the spread of said disease. The defendant's brother, manager of the hotel, was also summoned for a similar offence. Mr. J. Mara appeared for the defendants.

Mr. Lord (for the Guardians)—Your worships will agree with me I am sure when you have heard this case, that it is one of gravest importance to the public. Within 200 yards of this court-house, the proprietor of a public hotel and his brother are at this moment suffering from small-pox. The guardians, as the sanitary authority, in their endeavours to prevent the spread of this dreadful disease, have endeavoured by every means in their power to induce the family of the proprietor to close this hotel, and although they at first agreed, on the law being explained to them by the constabulary, yet, acting on some exceedingly pernicious advice, they altered their minds, and insisted on keeping it open in defiance of the law. The present prosecution was brought under the 144th section of the Public Health Act, 1878, which says that "any person who knowingly lets for hire any house, room, or part of a house in which any person has been suffering from any dangerous infectious disease without having such house, room, or part of a house, and all articles therein liable to retain infection, disinfected to the satisfaction of a legally qualified medical practitioner, as testified by a certificate signed by him, shall be liable to a penalty not exceeding £20. For the purpose of this section the keeper of an inn or school shall be deemed to let for hire part of a house to any person admitted as a guest into such inn or school respectively." Now, as I have said before, these parties, acting on this bad advice, came to the conclusion that they would close the hotel, but keep open the public-house. That there was neither sense nor reason in this conclusion I will satisfactorily show your worships from the definition of the word "inn," as given in the 26 and 27 Vic., c. 41, which says "that any hotel, inn, tavern, or public-house, or other place of refreshment, the keeper of which is now by law responsible for the goods and property of his guests, and the word 'innkeeper' shall mean the keeper of any such place." I think your worships have the law now clearly before you. With respect to the facts, no later than last Tuesday a respectable family came from a long distance into the town, and putting up at this hotel, two young ladies, members of the family, went up stairs, and remained in a room for over an hour within six inches of where these people were suffering.

Mr. James Clandillon, sub-sanitary officer, swore he served a notice on the proprietor's brother to close the house. The proprietor's brother said he would not do so, as he had had legal advice that the authorities could not compel him to do so. While he was there people were drinking in the shop.

Mr. Hamilton—Are we to take it for granted that small-pox was in this house? We have had no legal proof of it as yet. This is a penal statute, and I think we should have formal proof.

Dr. P. L. O'Neill sworn and examined by Mr. Lord.—I am at present attending on Mr. Gerald and Mr. Hugh Tomlinson. I must decline to answer as to the nature of the disease they are suffering from. It would be a breach of the confidence that exists between a doctor and his patients.

Mr. Hamilton—That I am sure, Doctor, is professional etiquette; but I must tell you it is not law.

Dr. O'Neill—Do you hold that you and your brother magistrates can compel me to commit a breach of professional etiquette?

Mr. Mara—I may tell you, Doctor, you are bound to answer the question.

Dr. O'Neill—Then if I am I may tell you that both the brothers are suffering foom small-pox.

Mr. Mara—It would be rather hard to fix on this particular house to close, for we all know that there were several houses in the town where there is small-pox, and the shops were not closed. Section 137 of the same Act says:—"Where any sanitary authority are of opinion on the certificate of their sanitary officer, or of any legally qualified medical practitioner, that the cleansing and disinfecting of any house, or any part thereof, or of any articles therein likely to retain infection, would tend to prevent or check infectious diease, it shall be the duty of such authority to give notice in writing to the owner or occupier of such ho ıse, or part thereof, requiring him to cleanse and disinfect such house, or part thereof, and articles within a time specified in such notice." That is a condition precedent, and we received no such notice. The only notice we received was one to close our house, which there was no power under the Act to compel us to do. Section 137 and section 144 must be read together, and the latter, being a penal one, must be strictly construed. I say my client has not committed any offence under this Act after the directions from the doctor. They did not let for hire any house, room, or part of a house. Surely you would not hold that if a person comes into the shop (that is completely isolated from the remainder of the hotel) to purchase an article, that the shop is let for hire to such person. The meaning of the letting, in my opinion, is clearly the letting of rooms or houses, as in the case of Dublin or large towns where there may be several families in the one house. If a room or any portion of the house where infectious diseases had been, such not having been disinfected, were let to an incoming tenant, that would clearly be a breach of the Act. Suppose any respectable shopkeeper in this town had an assistant who contracted the disease, and he or she were removed to the top of the house and there isolated from

the remainder of the household, surely you would not hold that such shopkeeper would close his shop, nor have you any power to compel him.

Mr. Tomlinson was then called and swore he was conducting the business of the house during his brothers' illness. After receiving directions from Dr. O'Neill, he completely cut off all communication between the hotel and the shop. There was not a single guest admitted into the hotel since. No one could gain admittance except he gave them admittance by means of the keys he held in his possession.

To Mr. Lord—My brothers are attended by nurses. The nurses have no access to the shop. They never left the house since they were employed.

The magistrates retired for a short time, and on their return the

The Chairman said—We find the case is fully proved against Mr. G. Tomlinson, but we consider the importance of closing the house is so great that we are disposed to defer naming the penalty for a week, with a view to see if anything could be done towards effecting that object.

Mr. Hamilton—We consider the closing of the house would be of more importance than any penalty we could inflict.

Mr. Mara—In the interest of my client I must differ from the decision of the bench on a point of law. The question must be tried by another tribunal.

Mr. Hamilton—In the face of that plain statement, I think we ougnt to inflict the penalty.

After a consultation with Mr. Mara's client it was agreed to accept the decision of the bench, which was that the defendant should close his house immediately, and be fined £1, including costs.

## ATHY UNION.

### PAYMENT FOR EXTRA MEDICAL SERVICES.

THE following letter was read:—

"Local Government Board, Dublin.
"4th February, 1879.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of the minutes of proceedings of Board of Guardians of the Athy Union on the 22nd and 29th ultimo, and of the replies to the usual queries respecting Dr. O'Neill, whom the guardians propose to appoint medical officer of the auxiliary hospital for the treatment of small-pox cases, at a remuneration of £3 a week; and the Local Government Board desire to state that under the circumstances set forth in the minutes of the guardians' proceedings of the 29th ultimo, there would appear to be no necesssity for now appointing a special medical attendant, there being only, it seems, three convalescent cases of small-pox at present under treatment in the fever hospital, which will probably henceforth afford sufficient accommodation for such cases of the disease as may arise. When the epidemic can be pronounced to have ceased there will be no objection to the medical officer being remunerated for the extra duties imposed upon him, as already pointed out.

"By order of the Board,
"B. BANKS, Secretary.

"The Clerk, Athy Union."

Mr. O'Brien (Local Government Board Inspector).—The position you now stand in is that you have not a single case of small-pox in the fever hospital. You have twenty-two convalescent cases in the auxiliary hospital, but no acute cases. It is at the same time quite right that you should remunerate Dr. O'Neill for his past services. The exact position of your medical officer is that he is responsible for all your sick patients, no matter what they are suffering from; but in peculiar cases such as that which I hope you have now passed through it is the usual practice to grant a sum sufficient to recompense your doctor for the extra duties that may have been imposed upon him. Having seen some of the cases in your hospital during the recent epidemic, I can vouch that the duties of your medical officer were very arduous. Still, you must admit the resolution appointing the extra medical officer was rather inconsistent, for at that very meeting it was announced that the epidemic had ceased.

Mr. M'Laughlin—Might I ask Mr. O'Brien if it were the duty of Dr. O'Neill to attend the auxiliary hospital?

Mr. O'Brien—As I stated before, your doctor is responsible for all your sick, whether fever, small-pox, or scarlatina, but if the epidemic continued, and you considered one doctor was not able to attend to all the sick, it would have been quite reasonable to have appointed another. But at the time you advertised for a second doctor you also stated that the epidemic had ceased. That you must admit was inconsistent.

Mr. M'Laughlin—But when the medical officer sent in his resignation the Local Government Board seemed to sanction it, and allowed us to send out advertisements for a doctor.

Mr. O'Brien—But the Local Government Board had no knowledge of the circumstances at the time. There would be no objection, I think, now to your voting a sum of money to the doctor for his extra duties.

Resolved that the appointment be not made, but that Dr. O'Neill be voted £50 for his services during the epidemic.

Upon this matter the *Leinster Express* makes the following comment:

"The action of the Local Government Board in regard to this appointment is deserving of public attention. It is another example of the erratic conduct of the body appointed to exercise supreme control over local matters in Ireland. Some time ago the guardians proposed to remuuerate Dr. O'Neill, the workhouse medical officer, for the extra duties which the small-pox epidemic imposed on him, on a scale which many regarded as unreasonably liberal. The Local Government Board declined to sanction this proposal, and at the request of Dr. O'Neill, the guardians then inquired of the Local Government Board if it was part of the workhouse medical officer's duty to attend the auxiliary hospital. The guardians did not succeed in obtaining any definite reply to this inquiry. The Local Government Board informed them that it was desirable to postpone any decision regarding the remuneration to be paid to Dr. O'Neill for his extra services until such time as the epidemic shall have been stamped out. Not unnaturally Dr. O'Neill objected to the postponement for an indefinite period of a decision of importance to him, and on the 8th of January he asked the guardians to accept his resignation of the office of medical attendant to the auxiliary hospital, on the assumption that it was no part of his duty to attend that institution. The guardians acceded to his request, and directed the publication of advertisements inviting candidates for the office thus rendered vacant, at a salary of £3 a week. No objection having been made by the Local Government Board to this arrangement, the guardians, on the 22nd of January, proceeded with the election, and appointed Dr. O'Neill, who was the only candidate for the office who appeared before the guardians. On Wednesday, nearly a month after the order was recorded on the minutes of the proceedings directing the publication of the advertisement inviting candidates for the office of medical attendant to the auxiliary hospital, the guardians were informed for the first time that the Local Government Board declined to approve their proceedings."

## ABBEYLIEX UNION.

### PRECAUTIONS AGAINST SMALL-POX.

Mr. FOSTER said that at the meeting of the Ballyroan dispensary committee Dr. Moutray asked a question, namely, what was he to do if a case of small-pox occurred in his district? Would he send it to the workhouse hos-

pital? As far as he (Mr. Foster) understood the feeling of the committee, and he had a very strong feeling on the matter himself, he thought the case should not be sent in here, and that some provision should be made for keeping the patient in the district. At present there was no provision whatever.

Mr. Owen—Is it your opinion that each dispensary district ought to make provision for themselves in case of an outbreak of small-pox?

Mr. Foster—That is my opinion.

Mr. Owen thought it would be well to have information from the Local Government Board as to the powers of dispensary committees in such cases, even though the Ballyroan committee might not wish to avail of it.

Dr. Swan said he would be opposed to having provision made for the reception of small-pox cases in the various districts of the union, as it would be more likely to spread the disease than to do any good. On former occasions, whenever there was an outbreak of small-pox it was treated in the hospital. Two years ago small-pox was brought into the union on four different occasions, from Raheen and Dublin, and not a single patient was treated in their own homes, or in any other place than the hospital. The result was that they were enabled to isolate the disease, and stamp it out in a short time. Some years ago it was a common thing to have twenty-five or thirty cases of small-pox in the hospital here, and no one was frightened or alarmed at it. He was most decidedly in favour of bringing every case of small-pox into the hospital, where it could be isolated much better than any other way.

Mr. Owen—My idea is that harbouring cases in the different districts would be a means of spreading the disease.

Mr. Leech concurred, adding that it would involve a great deal of expense besides, and do very little good.

Chairman—If you had hospitals in the various dispenpensary districts it would be taking officers from their other duties to attend to them.

Mr. Owen—And not only that, but they would expect an increase of pay.

Captain Bland, believing that re-vaccination was about the best preventive that could be employed, asked had they the power to compel re-vaccination?

The Clerk said the board had no power.

Mr. Swan—In my neighbourhood the people are voluntarily coming forward themselves, and large numbers have been re-vaccinated.

Dr. Swan—We re-vaccinated the nurses in the fever hospital in preparation. I am inclined to look upon the whole thing as a scare.

Mr. Owen—It is altogether optional with people who have been vaccinated to be re-vaccinated, but the medical officers of the various districts should see that those who have not been vaccinated should be vaccinated at once.

## MONAGHAN GUARDIANS.

### SCOTSTOWN DISPENSARY.

The Clerk read a report from the hon. sec. of the Scotstown Dispensary, enclosing advertisement for a medical officer, in the room of Dr. Irwin, resigned in consequence of having been appointed to Kilkeel.

Mr. Pringle said that at the last meeting of committee, there was a motion to reduce the salary of the medical officer from £120 to £110. He himself was of opinion that it should be reduced to £100. These salaries were all got up by a howl from the doctors about the high price of provisions; and notwithstanding all that had been said about squireens, ditchers, and coachmen, he maintained that the salaries ought to be reduced. He also thought that more than a fortnight ought to be given for the appointment, because they wanted time—first, to fix the salary, for, if they advertised for a doctor at a high salary and then reduced it, they deceived the candidates. The salaries were all raised because of the increased prices of the necessaries of life. Why not reduce them on the same plea now when the necessaries of life were cheap.

The Clerk said he had letters from two medical men saying they would not take the appointment at £120, even if it were given them without asking.

Mr. Pringle proposed that the subject be referred to the dispensary committee, and that a special meeting be called to consider the advisability of reducing the salary.

Mr. Murray read the rule from the "Compendium," showing that the salary was to be fixed by the guardians and approved by the Local Government Board, and not by the committee.

## MOUNTMELICK UNION.

### EXAMINATION OF LUNATICS.

The Clerk stated he had received two magistrates' orders for £2 each for the examination of dangerous lunatics by Drs. Clarke and Tabuteau.

Mr. Cobbe said the magistrates seemed to take a delight in imposing unnecessary expenses on the union. The only satisfaction they (the guardians) had was that the landlord would have to pay half of the expenses.

Mr. Peacock remarked that this matter was brought before the Board before, and it was agreed only to give £1.

Mr. T. Malone—£1 is quite sufficient.

A resolution was then proposed by Mr. Cobbe, and seconded by Mr. Peacock, refusing to pay more than one guinea.

We have the pleasure to inform the guardians that they must pay the £2. The 10th section of the 30th and 31st Vic., cap. 118, leaves them no option if the certificates be all regular.

## KILKELLY DISPENSARY COMMITTEE.

At a meeting of the above committee held 18th January—Captain O'Gady in the chair.

Applications have been received from the office of Medical Officer from Dr. Thomas Keogh, Jervis Street Hospital; Dr. J. W. Rogers, Newport; Dr. Robert Graham, Tolka College, Dublin, and Dr. John Conry, of Raheen, Elphin.

Mr. T. Cassidy proposed, and Mr. Tyrrell seconded, that Dr. Conry be appointed Medical Officer of this Dispensary District, pursuant to advertisement."

No other candidate being proposed, Dr. Conry was unanimously elected, and undertook to take charge immediately on his appointment being confirmed by the Local Government Board.

The committee request the guardians to continue Dr. Burke as *locum tenens* until then.

## THE WORKING OF THE IRISH SANITARY LAW.

At a recent meeting of the Boyle guardians a letter was read from a ratepayer complaining of nuisances existing in that town. The sub-sanitary officers were asked for an explanation on the subject, and her said the nuisance was caused by defective sewage arrangements, *which the sanitary officer had reported on to the guardians and to the Local Government Board time after time.* The board directed the sub-sanitary officer to make a report on the subject for that day week. The clerk of the union mentioned that there was a great deal of difficulty experienced in carrying out the Sanitary Act owing to a clause in the new Public Health (Ireland) Act, which provides that cases under it can only be heard before two magistrates. He (the clerk) said they had found it almost impossible to secure the attendance of any of the local justices, with the exception of the resident magistrates.

## BELFAST BOARD OF GUARDIANS.

### THE SUPPLY OF MEDICINES.

Mr. Gaffikin said that when he came into the board-room that day week they were discussing the extravagance of having ordered some £20 worth of leather straps for the use of the inmates in the lunatic wards. He mentioned that they were paying £500 a quarter for medicine, or £2,000 a year. With respect to the medicine, he met the contractor in the news-room shortly before he came there, and was told by him that his account for last quarter amounted to £500, that his account for the preceding quarter came to a similar figure, and that they were paying about £2,000 a year under that head. In the way of medicines a saving might be effected if they had a chief depot in this department where the best medicines could be got as cheaply as possible, and when requests came from the different dispensaries this Board could give an order to their apothecary to supply them. He would not say what saving they would effect by this plan, but a trial would show. In that way poor people would not be likely to get more medicine than they required. He would not say whether they used all the medicine they got at present —that was another question. Mr. Gaffikin then moved the appointment of a committee to consider the propriety of establishing a chief depot in a portion of the new stores at the workhouse for the purpose of supplying medicines and medical appliances, and that the committee report to the Board on that subject that day fortnight.

Mr. Adams (Smithfield) seconded the motion. There were a great many matters to be considered in regard to the supply of medicines in connection with their dispensaries. He believed they had no proper check over the supply at present, and the appointment of an apothecary who would be responsible to the board, and would be required to give regular returns of the quantity of medicine dispensed, was a very excellent suggestion, and would lead, he expected, to good results. He did not want to say a single word against any of their dispensary officers, but they had an important trust to discharge, and they had a right to expect from all their officers returns of the medicines and appliances used.

Dr. Corry said it fell to his lot to go over the list of accounts for medicines supplied to the union. The items he examined were those that were not in accordance with the scale furnished by the board for medicines that were not estimated for. There appeared to be an extravagance in the way in which some medicines had been ordered. There was one particular medicine (sulphate of atropia) which was very expensive, and was estimated for at 2d. per grain, while the order given for that medicine was two ounces, amounting to £6. He ventured to say that £6 worth of sulphate of atropia was a sufficient quantity to last for the next thirty or forty years. (Laughter.) If other medicines were similarly ordered he did not wonder at the magnitude of the account. He thought that whoever ordered the medicines should be a person who understood the prices to be paid. The resident physician told him that he was not furnished with any list of the prices for the various articles, which he (Dr. Corry) thought was a gross mistake. If the system of the central depot such as had been suggested were adopted, where medicines could be taken in a crude state, and tinctures, pills, and different preparations made, he believed they would effect a saving of 50 per cent.

## ATHY DISPENSARY.

### SMALL-POX SERVICES.

At the meeting of the Athy Guardians, minutes read of dispensary committee recommending the Board of Guardians to give the medical officer, Dr. Kilbride, a sum of £50 as remuneration for his extra duties during the small-pox epidemic.

Mr. O'Beirne—I propose that the communication be marked "read." There is not a single statement as to the extra duties.

Chairman—It opens a door you will find it very hard to close.

Mr. Leahy—The doctor had almost double the number of cases to attend to in that quarter as he had in the corresponding one last year.

Chairman—But did he do more than order the cases into hospital?

Mr. Leahy—In some cases he did; but, of course, the majority of them were treated in hospital.

Chairman—But his duties were nothing like what Dr. O'Neill's were. The depression in trade is very great, and we ought to use every exertion to keep down taxation.

Mr. Leahy—I proposed £30 at the meeting. That would have been about double his salary.

Mr. Lyons—As a personal friend of the doctor's, I would be most happy to agree to the proposal, but in the interests of the ratepayers I must oppose it.

Mr. Leahy—The committee can give you no more information than I have. I compared his work during the quarter in question with the corresponding one last year, and I found he had double as many cases.

Mr. O'Brien—But you have no detailed information as to the number of cases he attended at the patient's own houses; that is a very material element in the case.

Ordered that the matter be referred back to the dispensary committee for further information.

## CARLOW UNION.

### INFECTED OATS.

The Chairman said there was rather a novel application from Dr. Nolan, Medical Officer of the Tullow Fever Hospital, to the effect that a family named Deane, from Bendenstown, was admitted to the hospital suffering from typhoid fever, and requesting that the relieving officer might be directed to have their house fumigated, and about three barrels of oats in a room in the house buried, and compensation given for the same.

Captain Newton never heard of oats having fever before.

Mr. James Nolan said he was guardian of the district, and had inquired into the matter. It appeared that Deane's wife died of fever in the room where the oats were stored, and a short time after her death he removed some of it for the purpose of having it cleaned and sent to market; but he caught the infection, was taken to the hospital, and died.

The Chairman said he would order the house to be fumigated and cleaned.

Captain Newton—I think they might as well make meal of the oats for the children.

Chairman—Yes; let them send it to the mill and have it ground.

## W. P. O'BRIEN, ESQ., LATE LOCAL GOVERNMENT BOARD INSPECTOR.

### TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I observe by one of the daily newspapers that the above-named gentleman is transferred from the post of Local Government Board Inspector to, I hope, a much more lucrative position in the Prisons' Board Department of Ireland. Permit me to suggest through the columns of your journal, which with scarcely an exception is every week to be found in the hands of the Poor-law Medical Officers of Ireland, that I am sure that the official connection which for so many years existed between Mr. O'Brien and them will not be allowed to terminate without his receiving a suitable token of the respect and esteem in which he was held by us all. Whilst he ever with efficieiency and precision discharged the duties of his office, he always endeavoured to give as little trouble as he possibly could to the medical officers of his district.

On the retirement of the late Dr. John Hill from the post of medical inspector I was instrumental in organising with great success a suitable testimonial to him. I have no doubt that by every medical officer with whom Mr. O'Brien had any official connection the suggestion which I now make for presenting him with a substantial proof of our regret in his now ceasing to be our inspector will meet with a cheerful response.—Yours truly,

Swords. F. J. Davys, L. & F.R.C.S.I., &c.,

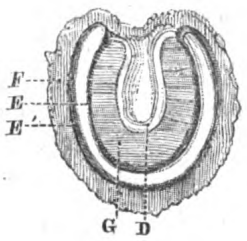
### V. Visceral Epithelial Cirrhoses in General (*continued*).

*b.* Another series of experiments show perhaps still better than the preceding the independence enjoyed by the epitheliums with respect to the sub-jacent tissues, they were made by M. Zielonko. The cornea of a frog was cut out, and introduced, soon after the operation, into the cavity of the subcutaneous lymphatic sac of another frog. Care was taken to introduce this cornea folded on itself, so that its external or epidermic surface faced the walls of the lymphatic sac (fig. 21). There is soon formed around the foreign body a sort of false membrane or fibrous cyst, which does not lie immediately on the epidermic surface of the cornea, but remains separated from it by a space. Now the cavity in question is soon found lined throughout its whole extent by a regularly disposed epithelium, recalling, except as regards the multiplicity of layers, the endothelial investment of a serous membrane. One may follow, step by step, in this experiment the development of the new epithelial investment, which from the cut surface of the cornea extends progressively on to the internal surface of the fibrous envelope. Thus in contact with the old epithelium the new epithelium is regenerated, and grafts itself by its surface to a *fibrous* membrane, that is to say a *non-organised* one.

*c.* This is the place to recall the fact that the products of the growth of an epithelial investment may not only expand on the surface, but may also extend into the thickness and depth of the subjacent tissues in a digital form, by a process of invagination. This process resembles the mode of development of glands, as it is observed in the embryonic period according to the descriptions of Remak and Kölliker. According to these authors you know that when a gland is formed under a surface covered with epithelium, there arises from the deep surface of the investment, of epiblastic origin, a projection which forces itself progressively into the thickness of the

FIG 21.



(After Zielonko.)

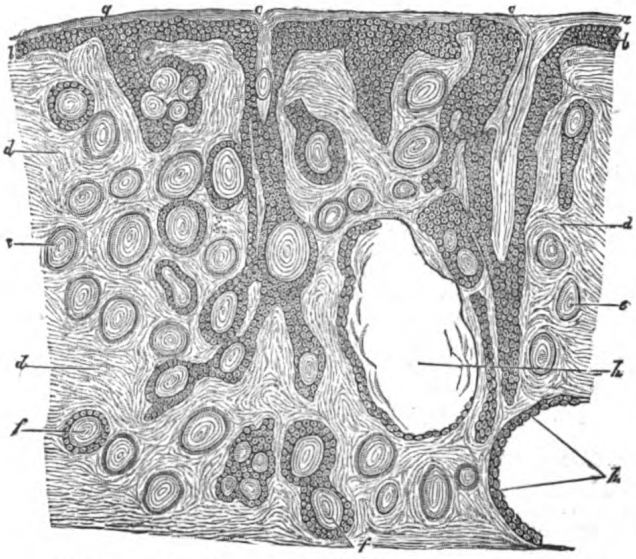
subjacent tissues, of mesoblastic origin, and this projection consists at first of cells of the same kind as those which form the epithelium from which it arises. It is on this model that certain cancers appear to be formed—all cancers, some authors, including M. Waldeyer, say—certainly, some of them are thus formed; the squamous epitheliomata, for instance, and also the cylindrical. This mode of development is easily demonstrated in the case of cancroid in the earlier periods of its development at

the surface of the skin. We see in such a case in sections perpendicular to the surface of the integument, epithelial prolongations arising either from the inter-papillary grooves, or from the sebaceous glands of the hair follicles, penetrating into the thickness of the dermis like the fingers of a glove (fig. 22).

FIG. 22.



Microscopical section of an Epithelial Cancer from the external surface of the Nose.

*a.* Horny layer. *b.* Malpighian layer. *c c.* Root of the hair, disposed irregularly and formed of concentric layers of epithelial cells. *d.* Stroma of the cancer. *e.* Epithelial globes without intermediate connective tissue, scattered in the stroma. *f.* Epithelial globes in the middle of a circle of epithelial cells. *g.* Epidermic prolongations disposed irregularly with epithelial globes, projecting into the subcutaneous connective tissue. *h h.* Two larger cancerous alveoli: their contents have in great part fallen out: on their wall may still be seen a layer of flat connective cells, and at the centre the remains of a mass of horny epithelial cells.

These epithelial processes are in some degree comparable to the acini of glands. It is to be remarked, nevertheless, that there is not here a regular epithelial structure. In fact, as M. Cornil long since showed, in the epithelial prolongation the cells do not present a regular arrangement, and besides they are not separated from the tissue into the midst of which they plunge by any distinct coat.

The formation of similar epithelial prolongations it is important to remember, is not seen only in the case of cancer. It is also observed in lupus and in elephantiasis, according to Friedlander. It is also seen, says the same author—and this brings us back to the chapter of chronic pneumonias—in the thickness of the bronchial walls in animals in whom one has succeeded in producing experimentally prolonged catarrhal pneumonia. (Carl Friedlander. "Ueber epithelwucherung und Krebs," fig. 8, pl. 1. Strasbourg. 1877.)

I think I have said enough to show the predominating part played by epithelial lesions in the production of certain pathological alterations, for it is at least very likely that in all the cases I have just cited the lesion of the subjacent tissues is a secondary, and, to a great extent, accessory phenomenon. To return now to the cirrhoses which I proposed to call epithelial, the reality of the fact which I endeavoured to bring into prominence, already made very likely by all which precedes, becomes perhaps still more so in experimental conditions. I would recall the fact that the lesions of biliary cirrhosis are, as M. Gombault and myself have shown, imitated, so to speak, after ligature of the bile duct. We see in such a case the alteration extending, little by little, along the biliary canals, and even to the intra-acinous biliary capillaries. It is true that in this experiment the enormous epithelial growth often noticed, is not clearly seen free from the participation of the subjacent connective tissue. But it is not the same in the case of chronic epithelial pneumonia after section of the recurrents. The analysis which we have given you of the lesions observed in such a case after the works of Friedlander and Otto Frey, shows that the alterations commence only in the epithelial investment, and that the pneumonia thus produced is above all an epithelial pneumonia before becoming an interstitial pneumonia. The practical interest which is attached to the distinctions I endeavoured to establish—distinctions, perhaps, at first sight, apparently subtle—cannot escape your view, if you will recall the history of the hepatic and renal cirrhoses which I have given you in preceding courses. The biliary, or otherwise called epithelial, cirrhoses, constitute we may say, henceforth, anatomical species absolutely distinct from common cirrhosis, and to which are attached during life a train of symptoms peculiar to each, which enables us in the majority of cases to establish the diagnosis. I have also, besides, called your attention to the differences, as much anatomical as clinical, which separate from one another the various forms of renal disease, not long since mixed up under the common term of chronic Bright's disease. Everything leads us to hope that studies conducted on the same principles will enable us to disentangle the still very confused chaos of the chronic so-called fibroid pneumonias. At present it is certain that besides the chronic pneumonia of catarrhal origin, which I proposed just now to call *epithelial cirrhosis of the lung*, of which I have given you by anticipation an anatomo-pathological sketch which I propose to fill up later on, there exist other forms of fibroid pneumonias very distinct, at any rate anatomically. Such is, for instance, *chronic pneumonia consecutive to acute lobar pneumonia*. Such is also *chronic inter-lobular pneumonia*, which appears to me to be connected with inflammation of the lymphatics of the lung, and of which I shall be led shortly to speak. I designedly for the present, leave my enumeration incomplete. Up to this time, in truth, these various forms of chronic pneumonias perfectly distinct from an anatomo-pathological point of view, have not yet found their place in clinical medicine. But one can scarcely doubt that they will some day attain it, for experience shows that it is rare that the exact determination of an anatomo-pathological species is not sooner or later received into the domain of practice.

(*Concluded.*)

# Original Communications.

## CARIES OF BONES OF THE FOOT—DECEPTIVE INDOLENCE OF THE BONE COVERINGS—SYME'S AMPUTATION AT THE ANKLE. (*a*)

By B. WILLS RICHARDSON, F.R.C.S.I.

THE author observed that he considered it would be an unjustifiable occupation of the Society's time to exhibit specimens of ordinary caries of the foot, were not some useful practical lesson to be derived therefrom. The lesson to be taught by the diseased bones he exhibited was nothing more nor less than the question of the performance of one of those operations which writers on the conservative surgery of the foot delight to call "brilliant." The condensed history of the case which afforded these specimens is as follows:—

Joseph Megaw, æt. 19, was admitted to the Adelaide Hospital on the 21st of last October, to be treated for disease of some of the bones of left foot. He told us that previous to admission two gouging operations had been

(*a*) Read before the Surgical Society of Ireland.

performed on the foot, but that he left hospital before the wound following these operations had healed. From October, 1877, to October, 1878, he was incapacitated by the condition of the foot from doing any work; and as it continued tender to the touch, and painful when he put it to the ground, he entered our hospital on the day I have mentioned, for further treatment.

On investigating the case we found that he also had an open indolent bubo in the left groin, the chief area of which was situated below Poupart's ligament. It was riddled with sinuses, but eventually healed when all these were laid open. Although there was a depressed opening at the inner side of the dorsum of the foot, and a small opening at its outer side, which would heal and remain so for days, there was no other discolouration, nor was there any appreciable swelling or thickening of the bone coverings. The discharge was almost *nil*.

As there could be little doubt, however, when we recollected the synovial membrane anatomy of the tarsus, that notwithstanding the latency of the local symptoms, there was every probability that the middle and distal rows of tarsal bones were more or less diseased, the question arose as to whether an attempt should be made to save a portion of the foot. But on reflecting that the disease was constitutional, that the patient had been operated upon twice before admission, Mr. Syme's reasoning guided me in the decision to perform his operation, rather than run the risk of performing a futile one.

The wisdom of this resolution was demonstrated by the specimens, as they unmistakeably showed what an escape the character of conservative surgery had in this decision; for any other operation than the one he performed would have ended in failure, the bones diseased being—the three cuneiforms; the corresponding ends of the three inner metatarsals, the second and third being the most diseased; the cuboid; the navicular; the neck of the astragalus; and the os calcis between its upper articular surfaces. The cuneiform and the navicular bones were most diseased, the disease in the astragalus and calcis being limited to softening, and to a small amount of caseous infiltration, and would have been easily overlooked in either a Pirogoff, a sub-astragaloid, or a Hancock's operation.

## CASE OF GENU-VALGUM. (a)

By MALACHY I. KILGARIFF, F.R.C.S.I.,
Surgeon to the Mater Misericordiæ Hospital, Dublin.

The following is the history and clinical record of a case of genu valgum recently treated by me by an operation devised by Dr. Alexander Ogston, Surgeon to the Aberdeen Royal Infirmary, and practised by him for the first time on the 17th May, 1876.

On September of last year I was requested by the parents of a young lady to inquire carefully into her condition, and to correct, if possible, the disabling and pitiable deformity from which she suffered. On examination, I found her to be the subject of well-pronounced genu valgum.

On inquiring, I elicited that she was then 15 years old; at birth, that she was a rather delicate infant, and was early attacked with infantile diarrhœa, which proved very intractable, and weakened her very much. When a year and a-half old she caught measles, and made a tedious and bad recovery. Severe bronchitis supervened, and lasted until the end of her second year; during this time she did not walk. She now plucked up strength, got a good appetite, and grew very fat, especially on thorax and abdomen.

She evinced no capability of using her legs in locomotion, and, in fine, did not learn to walk until she was over three years old. At this time she was very stout and heavy, and it was soon noticed that she was becoming in-kneed. Every effort was made to counteract this tendency, but without avail, the deformity continued and increased, and she became the subject of confirmed genu-valgum.

Recourse was now had to steels, and for two or three years she wore an elaborate apparatus, but without any benefit, and nothing further was done in this direction, until she came under my care.

I found her to be an intelligent and sensitive girl, painfully conscious of her disabling and distressing deformity, and most willing to undergo any operation that was likely to correct it. Her complexion was pale, and facial expression rather sad. Her muscular system was not well developed, and her growth was somewhat stunted. Locomotion was difficult, and when walking her movements were awkward and ungainly, the body swinging on a vertical axis traversing the median line. She moved forwards in a jerky manner, the lower limb taking a wide sweep and passing well in front of the other before resting on the ground and fixing itself for the support of the body. The shoulder and upper extremity of the same side participated in a striking manner in these movements. When standing or lying on her back the knees touched—the legs forming with the thighs the limbs of the letter Y. When her inner ankles are placed in contact, one knee crosses completely in front of the other, leaving a space of a few inches between.

When in the upright position the legs formed, with the thighs, an angle of about 150°. The deformity on the left side was somewhat more than on the right. When the legs were flexed to about a right angle, they were brought into the same plane with the thighs. The patellæ were slightly displaced outwards. The internal condyles of the thigh bones were half an inch longer than normal, and the external lateral ligaments of knee-joints and tendons of the biceps were remarkably strong and tense. There was nothing abnormal in the other long bones, nor were the sternal ends of the ribs nodulated.

It appeared perfectly clear to me that the elongation of the internal condyle was the chief obstacle to the correction of the deformity. It threw the leg out, and to effect a cure the condyle should, I thought, be sawn off or displaced upwards.. I proposed Ogston's operation, enumerating its risks; the patient willingly consented to submit to it, and her parents cheerfully acquiesced.

Accordingly, on the 22nd of last October, I proceeded to operate, assisted by Mr. Meldon, Mr. Collins, and Dr. McSwiney.

The patient was placed under the influence of ether, the left knee flexed, and the thigh everted. A long tenotomy-knife, made to my specification by Messrs. Fannin, I introduced about one line in front of the internal condyloid ridge and 2½ in. above the joint. I directed the point of the knife towards the groove in front of the condyles, keeping the blade close to the bone. When I felt its point beneath the skin, I pressed its edge against the bone, and, by a sawing movement, divided the soft parts and periosteum.

Through the canal made by the knife I introduced Adams' saw for sub-cutaneous osteal section, and sawed directly through the bone. When I was conscious that I had almost divided the internal condyle, I applied my knee to the inside of the joint, and using the patient's leg as a lever, I completed the detachment of the condyle, which gave way with an audible snap.

I now readily drew the leg into its proper position, the tibia pressing the internal condyle upwards and placing it in normal relation with its external fellow.

I dressed the wound with lint soaked in carbolic oil, and fixed the limb in a straight position by Liston's long splint. The carbolic spray from Lister's apparatus was playing on the wound during the operation. Twenty drops of Battley's sedative were administered soon after the operation, and one drachm and a-half of syrup of chloral in the evening.

Oct. 22nd, 1878.—9.30 p.m., pulse 84; temp., 100·2.

23rd.—9.30 a.m., pulse 84; temp., 99·4. 2 p.m., pulse 130; temp., 100. 9.30 p.m., pulse 110; temp., 101·8.

(a) Read before the Surgical Society of Ireland. The discussion will be found on page 164.

24th.—9.30 a.m., pulse 128; temp., 102; slept well last night.

25th.—9.30 a.m., pulse 116; temp., 99·8; some oozing from wound. 9.30 p.m., pulse 120; temp., 101·2.

26th.—9.30 a.m., pulse 104; temp., 99·4. 9.30 p.m., pulse 120; temp., 101; removed lint and applied fresh dressing.

27th.—9.30 a.m., pulse 104; temp., 99·2. 9.30 p.m., pulse 110; temp., 101·2.

28th.—9.30 a.m., pulse 110; temp., 100·2. 9.30 p.m., pulse 124; temp., 101·6; joint swollen, but no extravasation within the capsule.

29th.—9.30 a.m., pulse 108; temp., 99·6. 9.30 p.m., pulse 124; temp., 101·2.

30th.—9.30 a.m., pulse 110; temp., 99·8. 9.30 p.m., pulse 120; temp., 100·4.

31st.—9.30 a.m., pulse 96; temp., 98·8.

Nov. 1st.—9.30 a.m., pulse 100; temp., 98·5.

2nd.—9.30 a.m., pulse 96; temp., 98·6.

3rd.—9.30 a.m., pulse 88; temp., 98·8.

I did not consider it necessary to record the condition of the pulse or the temperature after this date. No blood collected in the joint, nor was there at any time the slightest semblance of synovitis.

On the 7th November, I placed the patient under the influence of ether, removed the splint, and carefully examined the wound, which I found quite closed. I forcibly flexed the leg, grating sounds being heard during the proceeding. I again re-applied the long splint.

On the 16th November, I operated on the right knee. No constitutional disturbance whatever followed this proceeding, and in four days the wound was quite closed in.

I may remark that when proceeding to operate on the right knee the spray apparatus proved out of order, and had to be dispensed with. Her progress was most satisfactory.

On the 30th November, I removed the splint and flexed the leg, re-adjusting the apparatus.

On the 10th December, I again tried passive motion, and permanently released the limb from its fixings.

On the 20th December, she was able to walk slowly round the drawing-room leaning on crutches; and on Christmas-day she was present at the family dinner. From this date her improvement was uninterrupted; and at present her condition is most satisfactory, and her cure perfect.

I visited her to-day, and with laughing face she informed me that she went to the pantomime a few evenings ago, ascending the stair to the circle with perfect ease.

At my request, she walked several times round the drawing-room, her movements being graceful and easy, and not succeeded by any feeling of pain or fatigue. On examination, I found the limbs to be quite straight, the conformation of the right knee being perfectly normal, while a slight puffiness yet remained on each side of the patella of the other.

This, as far as I know, is the first case of Ogston's operation in this country—the result was all that could be desired, and warrants me, I think, in strongly recommending the operation to the profession, believing that it will prove a prompt, safe, and effectual remedy for that most distressing and crippling deformity—genu-valgum.

## INTRA-UTERINE FRACTURES. (a)

By R. L. SWAN, F.R.C.S.I.,
Surgeon to Dublin Orthopædic Hospital; Member of Surgical Court of Examiners, R.C.S.I.

I HAVE the honour, Sir, to bring under the notice of this Society a class of cases, the pathology or production of which many of its members may be in a position to throw a light on. I have myself seen six cases of intra-uterine fracture; none, however, immediately after birth, but at ages varying from nine months to twelve years. I had always regarded the affection more as a surgical curiosity than in a practical light until recently, when my attention has been directed to the subject, and where I have been induced to take some measures for the amelioration of the deformity.

It is, I think, incumbent on every surgeon who has an ambition to elevate his art, and with it to elevate his own knowledge, to use and modify the power he holds as nearly as possible by set rules, on the one hand not being too easily deterred by diffident or inconclusive axioms, nor on the other too easily impelled by his own rashness. The literature of this subject, then, presents a study of interest regarding its practical aspect, as well as a wide field wherein to view its theoretical features. A great number of writers have alluded to the occurrence of intra-uterine fractures, notably, Devergie, Kopp, Schubert, Barker, Flecken; and before the Royal Medical and Chirurgical Society, in 1860, an interesting paper was read by Mr. Bernard Brodhurst on the subject, in which he refers to some points of distinction which may be observed in those fractures. He shows they may be either simple or compound, dis-united or re-united at birth, or that solution of continuity may be due to imperfect ossification or congenital rachitis. Excluding on the present occasion compound fractures, also those disunited at birth, and fractures occurring in rachitic subjects, I will confine myself to the consideration of those cases which have come under my own observation, namely, simple fractures united at birth, and existing in the persons of children free—with one exception—from rickets. In that instance the rickets was (if the term be allowed), acquired. In five of those cases the fracture was situated somewhat below the middle of the tibia; in one about the centre of the radius. A depression of the integuments was situated opposite the fracture in all those cases. The bone in each instance was distinctly, though not intimately, attached to this umbilicus. In one example, that of a boy 12 years old, club-hand co-existed with the fracture, which was in the tibia of the same side. In three cases deficiencies of the toes of the same foot were observed. One was the subject of hare-lip, and the remaining case, that of fracture of the radius, was without any other deformity, except that the lower portion of the ulna seemed imperfect or absent. In each fracture of the tibia, the lower portion of the fibula was either absent or welded in one mass with the tibia. The tendons were also abnormally placed and matted together, and a condition which may be termed equino-valgus existed. The condition of the bones thus referred to has been described by Dr. Little.

The accompanying cast represents the limb of a little girl, 2½ years of age, which was sent to me by my friend, Dr. O'Hanlon, of Castlecomer. In the upright position the child could only reach the ground with the toes. Where any weight was imposed on the foot it rotated outwards, and in consequence of there being no resistance at the external malleolus, an extreme degree of valgus was the result. The foot was then quite an inefficient support for the body, and it might naturally be anticipated that as the weight of the child increased, this state of things would in no degree improve. It can easily be imagined that the friends of such a patient would be most anxious to adopt any means to remedy her condition, and I was very earnestly implored by the mother of the child to devise some plan for her relief. I was at first deterred from any operative measures by the following reflections: 1st. That a want of a fair amount of success, which was very probable, would without commensurate result, expose the child to considerable danger and pain; and 2ndly. A statement from undoubted authority (Mr. W. Adams) that those limbs did not subsequently grow in proportion to the general development of the frame. On considering, however, the comparative freedom from risk which the antiseptic method confers in section of bones (as Dr. Kilgariff's interesting paper so well exemplifies this evening), and also on reflecting that if the sole were brought horizontal to the ground, a artificial support

(a) Read before the Surgical Society of Ireland.

might be adapted, so as to replace the absent or imperfectly developed fibula, and even if development of the limb did not proceed, a gradually elevated sole might be adapted as the stature increased. Accordingly, with a chisel I cut through the tibia, and dividing the tendo Achillis, brought the limb as straight as possible, gaining as nearly as I could estimate, about two inches in length by the proceeding. Having placed a carbolised pad over the wound, I adapted a splint to the limb. It is needless to give the details of the case. The bone united, I may say, without suppuration. A tendency to valgus remained, which was overcome by dividing some fibres which were presumably the peronei tendons, and which seemed to produce it. A tendency to equinus was easily rectified by manipulation, and the child on being fitted with a boot and double steel, with a cork sole 1¾ in. thick, walked with the greatest facility. I had an opportunity of seeing the child about a week ago; she is going on very satisfactorily.

The cause of those accidents must, I think, Sir, be admitted to be extremely obscure; and although speculations on non-preventible occurrences may be considered to be to some extent unprofitable, still, I think the wide domain over which the numerous observers of our profession roam at will, with so many workers, should leave no region unexplored, no object of interest unnoticed, nor no corner which reveals a truth unsought. At first sight the two most reasonable and obvious factors of such accidents would seem to be—1st. Causes operating from without, such as injuries to the mother; 2nd. Muscular contractions occurring abnormally in the fœtus. With respect to the first, I think it scarcely possible, with the membranes intact, that such an accident could happen. The second idea is, I think, worthy of more consideration. It is that adhered to in the paper by Mr. Brodhurst, already referred to. If, however, abormal muscular contractions can be imagined to produce fracture in the fœtus, it cannot so readily be seen how they can produce those variations in embryonic development with which they are so often associated. The two circumstances exist so frequently combined, that their causes can scarcely be dissevered. I shall not weary the Society by unsubstantiated speculations of my own on the subject; there are others here of greater experience in such cases who have had opportunities of forming views more matured and correct on the subject.

# Clinical Records.

## CALCULUS IN THE FEMALE BLADDER.

By Dr. CAMPBELL BLACK, Glasgow.

An interesting discussion, as reported in the *Medical Press and Circular* on this subject, took place recently in the Surgical Society of Ireland, and considering the divided opinions which prevail as to the mode of extracting calculi from the female bladder, the following brief notes of a case treated by me may possibly possess sufficient interest to justify their publication relative to the discussion in question.

Mrs. McL., æt. 44, came under my notice at the Glasgow Public Dispensary, February 28th, 1877. Patient was considerably emaciated, and was troubled with almost absolute incontinence of urine, and great pain in the hypogastric region. Altogether for no less a period than twelve years previously, her state was such as to have rendered her life perfectly miserable. She had been an inmate of the Royal Infirmary of Glasgow for some time; was treated, as she herself informed me, by hot fomentations, the administration of barley water and various "bottles," but was discharged in the same sorry plight in which she entered. On examination of the bladder I readily detected a stone; and having informed the patient of its existence, and the necessity for its removal, it was arranged that she should return next day, and have the necessary operation performed. Having resolved on rapid dilatation of the urethra, no anæsthetic having been administered, I introduced an ordinary dressing forceps into the urethra, and therewith dilated the urethra to the extent of allowing the introduction of the little finger, and subsequently of the index finger. Further dilatation was accomplished by the forceps. With the same forceps the stone was seized, and without much difficulty extracted. It is of oblong shape, still uncut, and whatever be its internal structure, externally it is obviously phosphatic. Its weight at the time of extraction was 186 grains; its circumference is 2¾ inches; and it measures, in its long diameter, as nearly as possible 2½ inches. Its exterior has the appearance of fine sand paper. Considerable amount of subsequent pain was allayed by morphia suppositories, and the internal administration of belladonna. There was incontinence for several days; the poor woman's suffering was, however, entirely relieved. About a fortnight afterwards she could retain her urine for about an hour, more especially in the recumbent than in the standing position, and this remark applies subsequently. I have reason to believe that until the time of patient's death, which occurred some ten month's afterwards, from what cause I am unable to say, she never regained complete control over her bladder. As in Dr. Atthill's case, it does seem incredible that the presence of so large a stone, and the suffering thereby occasioned, could have been borne so long.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, FEB. 14.

Dr. GREENHOW, President, in the Chair.

Dr. DOUGLAS POWELL showed a case of

LEPROSY WITH GLANDULAR ENLARGEMENT.

A photograph of the case in an earlier stage will be found in the "Pathological Transactions," vol. xxix.

Dr. Powell desired that a committee should be appointed to investigate the case. Later in the evening the President nominated Drs. Cayley, Duckworth, and R. Liveing to act as a committee.

Dr. R. CROCKER exhibited a case of

GENERAL WARTY GROWTH IN A BOY.

Dr. WILLIAM M. ORD communicated a paper

ON RHEUMATOID ARTHRITIS, FROM A CLINICAL POINT OF VIEW,

This communication was intended to draw attention to certain causal relations of one of the conditions included under the term Rheumatoid Arthritis, and to suggest a modification in the classification of arthritis. Thirty-three cases of that form of rheumatoid arthritis, which has been called by Haygarth "Nodosity of the Joints," and by Heberden "Digitorum Nodi," were analysed. All had occurred in women, and in all disturbance of the menstrual function, or disorders involving hyperæmia of the uterus and its appendages, were present. By the term "Nodosity of the Joints" was understood a symmetrical affection of many joints, chiefly of the hands, the affected joints becoming enlarged at their periphery, becoming loosened by loss of surface, and ultimately much distorted, the smaller joints being first affected, and extension taking place in a symmetrically progressive way from these to the larger joints. The subjects belonged in large proportion to the middle classes and were mostly between thirty and forty years o age. Several of them were distinctly passing through the climacteric period of life. Although many were anæmic, amenorrhœa did not exist in any. Dysmenorrhœa was noted in fourteen, half of which had also menorrhagia. Of the remainder several had menorrhagia simply, four had it in conjunction with ovaritis, and others in conjunction with the change of life or with tumours. The relation of the arthritis brought out by the cases was first its commencement in coincidence with menstrual disturbance; second, its paroxysmal exacerbation during, before, or after menstrual periods; third, its cessation as an active or progressive mischief on the cessation of the menstrual disorder; fourth, its alternation with

cerebral disturbance of a hysterical kind. Some cases were more fully detailed:—1. A case in which intense arthritic affection of the upper extremities was noted, in conjunction with severe dysmenorrhœa and menorrhagia; where constitutional treatment and the measures usually applied to the control of the rheumatic process having failed, the uterine conditions were treated sucessfully, with the result that the arthritis, as an active process, ceased, leaving, of course, the nodosity, but a painless nodosity. 2. Two cases in which the arthritis began at the climacteric period in combination with painless menorrhagia, and ceased as an active process on the final disappearance of the catamenia. In one the first attack occurred at a time when the catamenia, having been absent a whole year, returned in unusual excess; where the joints lost all inflammation and pain during subsequent interval, but became severely inflamed, greatly swollen, and painful during several subsequent menorrhagic periods. 3. A case in which a woman suffering from poly-articular arthritis at the climacteric period, the arthritis undergoing little remission in the intervals between the menstrual flow, developed somewhat suddenly hysterical mania. On the establishment of the mania the arthritis became perfectly quiescent, and remained so till the restoration of sanity. Sanity having returned, the arthritis resumed its progress. In this instance the excitement propagated from the uterine organs instead of undergoing reflexion from the cord was, as it were, refracted through the cord to the higher centres. The arguments founded upon these cases were—first, that there was good evidence to show the connection of this form of poly-articular arthritis with the uterine hyperæmia. It was argued, further, that the incitation to the arthritis was conveyed by the nervous system in a reflex way. In support of this view it was advanced that certain lesions of the central nervous system were known to be capable of producing trophic changes in joints, in certain cases identical with those of chronic rheumatoid arthritis; that urinary paraplegia was an evidence of the possibility that a paralysing influence might be reflected; that, therefore it was reasonable to suppose that trophic influence should be reflected; and that the mode of association of the arthritis and the uterine disorder favoured the idea of a nervous nexus, and the idea of this consisting in reflex action through the cord. The gonorrhœal and urethral arthritis of men were compared with the affections under consideration, and it was pointed out that the parts concerned with two cases were homologous parts. It was lastly argued that the local morbid process present in these cases was the same as that existing in mon-articular arthritis, in traumatic, and other surgical arthritis, in gonorrhœal and articular arthritis, in joints affected by morbid deposits and morbid growths in certain cases after true rheumatism, and in all cases coming under the head of rheumatoid arthritis; and that the term "rheumatoid arthritis" insufficiently covered the variety of clinical aspects of the joint-affection; that therefore it was desirable to limit or annul the use of the word "rheumatoid," and apply before the word "arthritis" some qualifying term descriptive in each case of the supposed clinical association. Ricord's term "blennorhagic arthritis," as opposed to the term "urethral rheumatism," was quoted as an instance of such application.

Mr. BARWELL did not understand from the description of Dr. Ord's cases whether the disease described was the typical arthritis deformans, attended with all its very marked photalogical changes. In his experience, this was a disease quite as prevalent in men as in women, and its origin could very frequently be traced to a blow or other injury. Exacerbation of the disease at the menstrual period should not, he thought, be considered indicative of a special connection between the uterine condition and the diseased state. Such changes were commonly met with in almost all chronic diseases.

Dr. GLOVER thought Dr. Ord's paper would prove a valuable contribution to our knowledge of this ill-defined disease. He regretted that the author had not traced the diathetic state. No mention had been made of histories of gouty or rheumatic tendencies. In his opinion quinine was a most valuable agent in the treatment of these cases.

Dr. MAHOMED considered it a distinctly hereditary disease, as much so as gout or rheumatism. For himself, he was inclined to lay great stress on the presence of a high pressure pulse as a distinguishing feature between rheumatoid arthritis and chronic rheumatism. In the latter, a soft pulse was quite as typical a feature; while in gout the high-pressure pulse was always present.

Mr. BRYANT would also ask Dr. Ord whether in his cases there were all the characteristic changes Mr. Barwell had alluded to, so distinctive of this disease which he preferred to call osteo arthritis. Several seemed to him rather allied to gout, while osteo arthritis differed essentially from that as from rheumatism. His experience agreed with that of Mr. Barwell in that the majority of the cases he had witnessed had been in men, and where women had been affected, he did not recognise uterine disorders as causative factors.

Dr. GREENFIELD remarked that his own experience strongly confirmed Dr. Ord's, in that he believed a disturbance of the uterine organs to be a frequent cause of rheumatoid arthritis. Perhaps no two observers would agree as to what cases should be included under the term. He regarded chronic osteo arthritis as a distinct affection. The disease in question was a symmetrical affection of the hands or feet, beginning at the index side and passing inwards; and he could bring forward cases supporting the opinion that it was associated with leucorrhœa and other uterine troubles, or in men with urethral irritation, with spermatorrhœa, and similar affections, an exacerbation of which coincided with that of the condition of the joint. With reference to the pathology of the affection he could not quite agree with Dr. Ord's neuropathic theory, but rather inclined to class these cases with the results of absorption of septic material from the urethra, or genital tracts: in fact, that there was some link between them and gonorrhœal rheumatism. In the treatment of these cases actæa racemosa was, in his experience useless, while local treatment directed to the uterine disorder was most beneficial.

Dr. DUCKWORTH took for granted that these cases of Dr. Ord's were genuine cases of osteo-arthritis; to the pathology of which his paper was a valuable contribution. In his opinion there was nothing to support the idea that it was a hereditary disease. Overwork and underfeeding were important elements in its causation, and, though he had seen the disease in young people, it was common in women, about the climacteric period, particularly in those whose business was in the laundry. He alluded to the characteristic adduction of the fingers.

Dr. ORD, in replying, remarked that two of his critics had looked at his cases surgically, while those who had supported his views were physicians; he admitted the difficulty of a definition of the disease, the essentials of which were, a waste of the cartilage and bone of the joint surface, and a hypertrophy of the periosteum and cartilage round the joint; there being no co-existing affection of tendons, but swelling and looseness of the joint, and a liability to displacement of it. The original describers of the disease varied in their descriptions. Haygarth had described it as occurring in women, and affecting many joints. Adams, as more common in men, and confined to single joints. Trousseau appeared to agree with Haygarth, Folin and Duplay, with Adams. In his cases, diathesis in its usual sense had little to do with the disease; he altogether objected to its being considered hereditary, nor could the meaning of arterial tension in these cases, or its worth as a diagnostic point be determined; to prove the absence of gout was difficult, but he had ascertained in every case the absence of urate deposits. He allowed that he could not prove the neurotic origin of his cases, but he believed that as yet there was no evidence of their septic origin. His position was this; there being great reason to believe that certain diseases of the spinal cord could cause disease of joint almost, if not wholly identical with this, why should not such a disease be producible by reflex effect as well as by direct influence. Charcot and German writers seemed for the most part to consider the disease not as a reflex but as a direct result of some affection of the cord.

Dr. MARKHAM SKERRITT, of Clifton, exhibited a

SPECIMEN OF COMPLETE OBSTRUCTION OF THE INTESTINE BY FIBRINOUS EXUDATION,

from a patient who had come under his care at the Bristol General Hospital. A young man, æt. 19, previously in good health, on the 11th day of last May felt slight abdominal pain, and was afterwards very sick; there were no febrile symptoms. Next day he suffered from vomiting and diarrhœa. After this vomiting continued, but there was no action of the bowels. On admission, a week after the onset of the attack, there were practically no acute symptoms, except frequent bilious vomiting. The skin was cool, the pulse 80, large, regular, and rather soft, the tongue almost clean, the abdomen moderately distended, and almost free from pain and tenderness. An enema of three pints was given without difficulty, but with no result. Opium and hot fomentations were

ordered. Next day some dulness in the flanks, changing with the patient's position, was noted. On the following day the patient sank rapidly and died. The temperature throughout was sub-normal. At the post-mortem examination, the ileus, about a foot above the valve, was found to dip down into the pelvis so as to form a loop, which was much contracted, intensely inflamed on its peritoneal surface, solid to the feel, much like a firm umbilical cord; and its canal was here completely blocked by a solid fibrinous cast, four inches long, firmly attached to the mucous membrane, and tailing off at either end as a ragged coating of a part only of the inner wall of the intestine. This loop of gut bounded anteriorly an irregular cavity containing fæces and partially lined with false membrane, into which the vermiform appendix was found to open. No foreign body was discovered. There was no fluid in the peritoneal cavity. The two points raised by Dr. Markham Skerritt in commenting on this case were, 1. The pathological condition; and 2. The data for diagnosis. Inflammation marked by the formation of a fibrinous false membrane was met with in the intestine in various conditions; but no other case had been found on record in which the intestine was completely plugged with the exudation. It was probable that such a condition could occur only where the inflammation was so intense as to cause stasis of the fæces; for otherwise the movements of the intestinal walls, and the flow of fæces, would interfere with the continued deposit of the exudation; and hence in dysentery, where diarrhœa was marked, no very thick layer of false membrane was found. In this case, probably, ulceration of the vermiform appendix occurred first, followed by its perforation and extension of inflammation throughout the small intestine; slight at first, corresponding with the period of diarrhœa, and then more intense, causing cessation of peristaltic action, and consequent constipation. The inflammation took on the croupous type, and complete blocking of the intestine was the result. The absence of fluid from the peritoneal cavity was worthy of note; and the physical signs might be explained on the theory that each individual coil of intestine in contact with the flanks presented to the percussing fingers, in one position a greater quantity of fæces, in another, a larger proportion of gas. As to the data for diagnosis; the sudden onset of symptoms was in favour of the presence of one of the causes of acute intestinal obstruction. But the preliminary diarrhœa which preceded constipation accorded only with the history of enteritis simply, in which a mild inflammation accompanied by diarrhœa was succeeded by a more severe implication of the gut, causing cessation of peristaltic action, and consequent constipation. But beyond this there was practically no positive evidence of enteritis, except bilious vomiting, all the other ordinary acute symptoms of this condition were absent. Notwithstanding this, a diagnosis of simple enteritis was made, founded upon an experience in which it had been the exception for acute abdominal inflammations to be accompanied by urgent symptoms. And yet this latency of symptoms was held to be of some positive value in diagnosis, as indicating the absence of any suddenly induced mechanical cause of obstruction, relievable, it might be, by timely operation. The following conclusions were derived from an experience which probably had been somewhat exceptional:—1st. That an entire absence of acute symptoms might co-exist with an intense local inflammation of the abdomen. 2nd. That if in a case of apparent intestinal obstruction urgent symptoms were in abeyance, it was in favour of the view that the condition was either non-acute, or, if acute, was not to be relieved by operation.

Mr. Howard Marsh read a

CASE OF ACUTE INTESTINAL OBSTRUCTION IN WHICH THE ABDOMEN WAS OPENED, A STRICTURE OF THE SIGMOID FLEXURE FOUND, AND A FALSE ANUS ESTABLISHED IN THE LINEA ALBA, THE PATIENT RECOVERING.

The patient, a woman of forty, had, on her admission into St. Bartholomew's Hospital, under Dr. Marsh, on Oct. 15, been suffering with acute intestinal obstruction, with frequent sickness and abdominal distension for eight days. She had previously considered herself well, and had experienced no trouble in the action of her bowels. No hernia, intussusception, or other causes of obstruction could be detected. The colon, which was distended, could be traced through the umbilical and left lumbar regions. The patient on her admission was found to be in a very exhausted condition, with a feeble pulse of 120, and a relaxed and clammy skin. During a consultation in the case some of the hospital staff advised, that since the colon could be felt to be distended, colotomy should be performed. Others, believing that the sudden manner in which the symptoms of acute obstruction had come on in a person who had apparently been previously healthy, indicated some form of internal strangulation, which if unrelieved might lead to gangrene of the intestine, recommended that the abdominal cavity should be explored. The latter operation was at once performed. An incision was made below the umbilicus in the linea alba, and the intestine—starting with the coil which presented in the wound—was traced towards the left iliac fossæ, each successive piece of the gut being returned as soon as it had been examined, and before another loop was drawn out. While this was being done a stricture of malignant character was detected in the middle of the sigmoid flexure. The intestine just above the stricture was fastened by numerous closely-placed sutures to the wound in the linea alba, and a false anus was established in this situation. The operation was found to be very easy, and was speedily completed. The patient made a good recovery, and left the hospital at the end of about two months. In his remarks Mr. Marsh very strongly insisted on the importance of operating in cases of abdominal obstruction—where the diagnosis can be established—before peritonitis and other local changes have ensued. He alluded to the large percentage of cases of ovariotomy in which the abdominal cavity is safely opened; and asked whether it could be more dangerous to open the abdomen, and divide a constricting band, or release an internal strangulation, than it was to remove a large tumour, which was, perhaps, extensively adherent to the omentum, the intestines, or the uterus? He believed a great future was in store for the surgical treatment of intestinal obstruction; and that the operation, if performed early, and with due care, and in cases in which a clear diagnosis could be made, would prove at least as successful as ovariotomy.

Mr. Bryant had not quite understood how far the symptoms were those of acute rather than a chronic stoppage, but he believed that from the history he should have been inclined to advocate colotomy, though it was always difficult to judge of this without being in presence of the patient. He entirely endorsed Mr. Marsh's observations as to the desirability of early operations in these cases.

Mr. Barwell thought that he also would have voted in favour of colotomy, which would have involved less risk than the operation performed, on the successful result of which he congratulated Mr. Marsh. He, like Mr. Bryant, was strongly in favour of an early operation.

Mr. Gould asked Mr. Marsh whether he thought it would have been profitable to have removed the intestine, having regard to its limited extent.

Mr. Marsh replied that the reason the abdomen was opened was—firstly, that the symptoms were acute; secondly, that no history of previous trouble could be obtained; thirdly, that the nature of the obstruction was obscure. He allowed that he himself had inclined towards colotomy, though there had been no symptoms of malignant stricture; the anterior position of the artificial anus was, he thought, an advantage rather than the opposite. It was more manageable and more easily attended to by the patient. He had not considered it advisable, seeing the exhausted state of the patient, to expose her to the risk of prolonging the operation by removing the diseased intestine by Bilroth's method; though in a suitable case he should undoubtedly do so.

The meeting then adjourned.

## SURGICAL SOCIETY OF IRELAND.

### Session 1878-79.

### Friday, January 31, 1879.

The Fifth Meeting of the Session was held in the Albert Hall of the Royal College of Surgeons,

Dr. Mapother, Vice-President of the College, in the Chair.

Mr. Richardson, (hon. sec.), read the minutes of the previous meeting, which were signed.

#### RARE SPECIMEN OF FRACTURE.

Mr. Wm. Thomson—The specimen I have to bring under the notice of the Society this evening, is one which I removed

last Wednesday from a woman in Richmond Hospital, sent to me by Prof. Minchin. It is one of extreme rarity, as we find on dissection, and for the identification of it, I am largely indebted to my colleague, Dr. Corley. The history the woman gave us, was that two years ago, she twisted her foot whilst getting on to a pathway, and she broke her leg. When taken into hospital, the condition of the parts was very much as shown in the cast. We have this prominence produced by the complete dislocation inwards of the tibia, and on the outer side, corresponding to the depression in the cast, is a fracture of the fibula. On dissecting the specimen, it proves to be an admirable example of the fracture described by Dupuytren, and of which he says that in 200 cases during a course of fifteen years he had only met one. The position of the fibula with reference to the tibia is almost directly behind, while the tibia has been rotated in such a position that the crest points directly outwards. The inferior articular surface of the tibia has lost the natural depression, and we have a convex instead of a concave surface. Next, resting on the astragalus, is the lower end of the upper fragment of the fibula, and outside is the external malleolus, completely detached from the shaft of the bone. There is a general anchylosis of all the fragments. We have the external malleolus anchylosed to the outer side of the astragalus, and the tip of the tibia also on the inner side firmly attached. If you allow me, I will read one or two points that Mr. Adams mentions of injuries of the ankle-joint :—"Complete luxation of the tibia inwards from the astragalus, complicated with a single fracture of the fibula. This is a very severe, and fortunately a very rare accident. In alluding to it, Dupuytren says that 'the foot is not only susceptible of being carried outwards, but also upwards at the same time ;' a double displacement which he had observed to occur only once in 200 cases of fractures of the fibula, treated in the Hôtel Dieu, for fifteen years, 'but the case was so marked,' he says, that in future it cannot be mistaken or passed over in silence." And then he describes the only cases he had seen. I suppose when this fracture was first seen, it would have been possible to have diagnosed what had actually happened ; but I very much question whether it would have been possible to have reduced the dislocation ultimately, and procured a satisfactory result ; because we had here the fibula acting as a wedge between the external portion of the malleolus and the tibia itself, and unless it had been possible to remove the fibula from its position within the joints, as it rested on the astragalus, and bring it into apposition with its other portion at the outside, I do not see how the dislocation could have been got rid of. Mr. Thomson said he had not had time to look further into the subject, wishing to exhibit the specimen as a fresh one, but he would bring the case forward on a future occasion.

### OVARIAN CYST.

Mr. Stokes—I shall not detain the Society more than a few moments in exhibiting this cyst, which is that of an ovarian tumour, I removed last Wednesday week at the Richmond Hospital from a young woman, aged nineteen years, who had been the subject of abdominal enlargement for the last two years. She came under my notice first in Dec., 1877 ; she is a dark-haired, florid complexioned, well-nourished unmarried female. For two or three months previous to her coming to me, she had suffered a good deal from amenorrhœa. She observed there was an enlargement, chiefly on the right side. I made a careful examination, assisted by Dr. Kidd, our obstetric consulting surgeon, and my other colleagues, and we came to the conclusion that the case was one of ovarian disease. As, however, the tumour was at the time comparatively small in size, and her health otherwise extremely good, we thought it would be desirable to postpone all operative interference. I may also say that I consulted Mr. Spencer Wells in reference to the case, having discussed the point on more than one occasion as to whether it is desirable or not to perform ovariotomy when the tumour is in an early stage of development ; and he agreed with Dr. Kidd and others as to the desirability of postponing operative interference until the tumour got larger. On last Wednesday week I performed the operation, removed the tumour, and found this cyst, the contents of which were very thin. I have never seen anything like it in any case I have witnessed or operated on. The contents of it were perfectly clear and transparent as spring water. There was a very large quantity ; but I have unfortunately not had an opportunity of getting a careful analytical examination of the fluid made, owing to an accident immediately after the operation. The quantity of the fluid was very considerable. It was found to be a bilocular cyst with a very short, thick pedicle, which was secured by a silk ligature, and returned into the abdomen. The circumstance is gratifying that this adds another to the list of successful cases recently performed in the Richmond Hospital ; for the patient is now, I am happy to say, convalescent.

Mr. Richardson read a communication on

### CARIES OF BONES OF THE FOOT,

which will be found on page 158.

Mr. Kilgariff read a communication on a case of

### GENU VALGUM.

which will be found on page 159.

Dr. McSwiney thought the Society would agree with him in thinking that the operation detailed by Mr. Kilgariff was a very valuable one in the history of orthopædic surgery. He was himself present, and took a deep interest in its success. Having directed his attention to the subject of the deformity in question, he soon became convinced that there were two varieties of genu valgum, in one of which the cause of the deformity consisted in an excessive growth of the condyle ; and in the other, of an extremely relaxed condition of the fibrous structures and ligaments. The old method of treating it was by splints or tenotomy, but the modern method was much more rapid and much more successful. He found that a French surgeon, M. Delore, of Lyons, had recently been in the habit of breaking the knee-joint by putting his knee against the knee of the genu valgum, and forcibly setting it straight—a very violent proceeding, followed by the displacement desired of the tibial epiphysis. Mr. McEwen took a wedge out of the femur, while Mr. M. Shlegel removed a wedge out of the tibia. Mr. Reeves had been publishing cases attended apparently with success, where he operated in the line of Ogston, using a chisel, and undertaking not to enter the joint. Mr. McEwen, of Glasgow, had published cases in which he removed a V-shaped portion of bone from the femur. But it appeared to him, as the result proved, that Mr. Kilgariff, in adopting Ogston's operation, was wise ; and having, as he had said, witnessed the operation, and also seen the patient that day, he could fully confirm what Mr. Kilgariff had stated. When a student he remembered being cautioned that the knee-joint should never, if possible, be opened, as disastrous results were likely to follow ; but now there seemed to be immunity from serious consequences when not only was the knee-joint opened, but a piece of bone sawn off and left in the joint. He was astonished how the articular surface ever became even enough to admit of the motion he witnessed on the part of Mr. Kilgariff's patient, and that there was not considerable roughness where the condyle had been sawn off and displaced upwards and outwards. Moreover, synovitis, anchylosis, necrosis, non-union, suppuration, each and every one was likely to occur from so violent and serious an interference with such an important joint ; but the fact was undoubted that none of those consequences had resulted from Ogston's operation, which had been successfully carried ont in the present case. .

Mr. Ormsby said they ought to be much obliged to Mr. Kilgariff for his excellent paper ; but it contained two or three things to which slight exception might be taken. First, he had only operated in one case, and yet he recommended the operation adopted on the occasion as the best for the deformity called genu valgum, commonly known as knock-knee. Mr. A. Barker had also performed Ogston's operation in a case, and a fatal result had followed in three days.

Dr. Baxter referred to Reeves' operation, which he saw performed by Dr. Swan on a child between two and three years old. The valgum was better marked on the left limb than on the right. In operating Dr. Swan made a transverse incision about 1½ inch above the internal condyle, cutting into the bone until the tenotomy knife struck on the periosteum. Having made an incision of the width of that originally made, he struck three or four times with a mallet until he detached the bone very nearly down to the periosteum, but not entering the joint. He then took the limb and forcibly flexed it outwards, making a genu varum, instead of the genu valgum. It was then treated with carbolic dressing and put up in plaster bandage. Since the operation there has been no bad symptom of any kind. The temperature of the child had been nearly always the same. It would be a

question for the Society whether the foregoing operation or that practised by Mr. Kilgariff was to be preferred.

Dr. SWAN said he intended at a future meeting to give the case in detail; but he thought there was not much to be said in favour of Mr. Reeves' operation over that performed by Mr. Kilgariff. In selecting Mr. Reeves' operation he thought that the detritus from the saw passing into the joint might, perhaps, be a cause of irritation; but the facts had not shown that that had been the case. He could scarcely believe in the idea entertained by Reeves, that the condyle was not detached, and that there was no entrance into the knee-joint; for the condyle gave way with a distinct click or noise, as described by Mr. Kilgariff. Mr. Reeves' theory assumed an amount of elasticity in the encrusting cartilage, which he thought it did not possess. Mr. Kilgariff's case was sufficiently good; and if his succeeded as well he would be satisfied.

Mr. KILGARIFF, in reply to Mr. Ormsby's statement that he was not warranted in recommending the operation, having but slight experience of it, said in recommending it he bore in mind the literature of the subject, which he had carefully read. He was justified in stating that fifty such operations had been performed, of which the only one fatal was that quoted by Mr. Ormsby; and he believed that in that case the entire limb was enveloped in a plaster of Paris bandage, the wound being hidden from sight, and pyæmia resulted. Of course, Ogston's or Reeves' operation would only be warranted in a case of elongated condyle. It was not his intention to discuss in his paper the relative merits of the different operations, but rather to bring before this Society the particular case of which he had had experience himself.

Dr. SWAN read a paper on

INTRA-UTERINE FRACTURE,

which will be found at page 160.

The VICE-PRESIDENT said Dr. Swan had divided his paper into two important branches—the curative treatment of those deformities, and their causation in the womb. There were several specimens in the Pathological Museum of the College, including a curious one presented by Dr. Kidd.

Dr. KIDD did not think the specimen referred to bore upon the subject of Dr. Swan's paper. The child was born in the Coombe Hospital, presenting a remarkable appearance, and it lived a few hours. It was the premature offspring of a syphilitic mother; and on examination after death almost every bone in the body was found to be fractured. Certainly, there was not a long bone that was not fractured. Some of the flat bones were fractured also. The humerus had been fractured, and an osseous union had taken place. The ribs and legs had been fractured. Having examined it very carefully, the conclusion he came to was that it was a case of intra-uterine rickets, and that the fractures were possibly produced by muscular contractions. Mr. Barker would lay the specimen on the table. Though it did not exactly bear on the case Mr. Swan had detailed it might interest members.

Mr. STOKES reminded Dr. Swan of a work on the subject by M. Malgaigne, who in a very interesting chapter had given some remarkable cases of intra-uterine fracture, which he regarded as the results of very strong impressions on the mother. In one instance there were 112 fractures, and these occurred shortly after the mother had been present at an execution on the wheel, the bones being fractured in the situation usually found when death was brought about in that manner. He classified the cases into those resulting from external injury to the mother, from rickets, from contraction of the fœtal muscles, and from strong maternal impressions.

Mr. CORLEY asked Dr. Swan how, when the children were not seen till twelve years of age, those fractures could be pronounced intra-uterine?

Mr. RICHARDSON alluded to a case of intra-uterine disjunction of the upper epiphysis of the tibia published by him some years ago, in the case of a syphilitic child.

Mr. KILGARIFF said he had had an opportunity of witnessing a remarkable case that was within the recollection of Dr. Kidd. It occurred in the Coombe Hospital some years ago, and was that of an illegitimate child, the mother, about sixteen years of age, having been treated in some hospital in town for amenorrhœa. She had done her utmost to deceive the medical men she had consulted, and had taken very large quantities of aloes from time to time, and also of ergot. The child, most remarkable in many respects, was born in the hospital, and continued healthy to about the eighth or ninth day, when it suddenly expired. There was some suspicion or mystery overhanging the case, and he was asked to make a post-mortem examination, which he did. He found the cranial bones very imperfectly developed, more particularly at the border of the foramen magnum. For a long time he was puzzled to account for death. But on examining the foramen magnum he found some of the medulla oblongata was pressed upon and cut; and on examining the skeleton he found every long bone broken in two pieces, including the clavicles and every rib in the body. At the time it struck him that the fractures were caused by convulsions produced by the medicines with which the mother was drugged.

Dr. KIDD said the specimen produced was the case in question.

Dr. SWAN, in reply, said no doubt the cause of those fractures was obscure. The fractures in the specimen seemed to have occurred in a rickety child, the predisposing cause being muscular action or convulsions. As to how fracture and deformity were produced in the same subject it was hard to tell; however they might theorise about uterine currents, abnormal forces and so on, he did not think they had any data on which to base a correct estimate. Intra-uterine fractures were very characteristic, the welding of the tibia and fibula together, &c.

The Society then adjourned.

# Department of Lunacy.

## NUNN *v.* HEMMINGS.

THERE have been few cases within our remembrance which have been allowed to occupy the time of our law courts in such a useless manner as the one recently concluded.

Mr. Nunn, the unfortunate plaintiff, has been the inmate of no less than three asylums. He was placed in 1873 under the care of Dr. Forbes Winslow, in consequence of his having made two distinct attempts on his life; the first, by jumping out of a first-floor window, and the second, by swallowing his shirt studs. In addition to these he had made attempts on the lives of his children, and threatened that of his wife. He escaped from Dr. Winslow's asylum—in which he was treated as a drawing-room patient, having a certain amount of liberty and parole—to Munster House, Fulham, under the care of Dr. Blandford and Mr. Hemmings, in which asylum he alleges that he was placed in a padded room as a punishment for an attempted escape, and was subjected to cruel treatment by being "ducked" twelve times in a bath. This is the charge, but beyond originating in his own imagination it is not substantiated by a single witness. The attendants who were at the asylum at the time were all summoned at the trial, and testified, one and all, that the whole was a pure fabrication of the unfortunate plaintiff.

The Lord Chief Baron endeavoured to close the case immediately after the examination of Mr. Hemmings; but Sergeant Parry, the leading counsel for the plaintiff, would not consent to such a course, but for what reason we are at a loss to comprehend. The following medical men tesified to Mr. Nunn's state of mind at various periods:—Dr. Andrew Clarke, Dr. Boyd, Dr. Blandford, Dr. Stephens, Mr. Hemmings, Dr. Forbes Winslow, and Dr. Puller. It is, however, rather surprising to us that the latter gentleman, who had come expressly to give his testimony in the case, should have entirely forgotten that he had signed two certificates for Mr. Nunn's incarceration—one for Dr. Winslow's asylum, the other for Munster House.

Every medical man who signs a lunacy certificate should keep a copy of what he has signed for reference. In addition to the evidence of the medical men and attend-

ants, was that of Mrs. Nunn, who proved that she had taken the utmost care of her husband during the commencement of his abnormal mental state when at home, and was reluctant to place him under restraint until it was found absolutely necessary to do so for the protection of herself and family, and for his own good and safety. The chief delusions under which this gentleman appears to have laboured, were that he was ruined, too wicked to live, and that he was starved. All these were proved in evidence to be delusions. From beginning to end the case was regarded as a sensational one. A crowded court who were never loath topublicly express their opinion, though they received a stern rebuke from the learned judge : an audience of women anxious to see asylums and their proprietors denounced and swept from the face of the earth, doubtless from personal motives and eager for revenge, in fact, the so-called "lunacy reformers" of England. The Chief Baron addressed the Court as follows on this subject :—

"Looking at the assemblage of Englishmen, and, I suppose I must call them, Englishwomen, who crowd this court, and who indulge in an abuse of the privilege of attending a public trial by giving vent to expressions of applause or condemnation, I would have cleared the court before this, however difficult it might have been, but that I might have excluded many who take a fair, just, and natural interest in the case, and who have conducted themselves with perfect propriety."

A case like this calls for small comment from us. Such allegations as those made by the plaintiff, substantiated by no witness, may be pronounced delusions. The learned judge evidently held this opinion, also the jury, and there could have been no sane person in court who could have arrived at any other conclusion. It is, however, a monstrous shame that a professional brother should be liable to be dragged into a court of justice, put to great personal expense, as well as mental anxiety, on the insane assertions of an escaped lunatic.

On the merits of the case the Lord Chief Baron says as follows in his summing up :—

"Is it true? The defendant says it is a delusion absolutely, and there is a great body of evidence showing that the plaintiff has had delusions of a disordered brain. In his story the plaintiff is directly contradicted by *every living man* who could have witnessed the scene if it occurred. While in support of his claim there is *not one single witness* who has deposed to *one* fact, nor any confirmatory evidence."

After this statement of the learned judge Mr. Hemmings would be justified in informing the proper authorities that this unfortunate gentleman is still at large. On the other hand, the learned judge let fall remarks to the effect that the statement of the plaintiff could not be substantiated by one single living witness, who could have been brought forward ; and if for one moment we can regard the plaintiff as a sane man, the only course open to Mr. Hemmings would be to indict him for corrupt and deliberate perjury. Mr. Hemmings leaves the court with the sincere sympathy of his professional brethren, and we say emphatically, without a stain on his character.

"Ordor Psychologicus."—There is a diversity of opinion respecting the smell which is said to emanate from insane persons. In a ward where several insane patients have been confined there is undoubtedly a peculiar odour. This is, however, considered by some to originate from the condition the patients may be in. It is impossible to keep them clean at all times of the day, and one or more of them may be in a state giving rise to the smell so characteristic of an insane ward. The condition of their alimentary canal is also to be considered. Very frequently the digestion has been neglected, and the effluvia which arises from the mouths of some insane persons and impregnates the air is due to impaired digestion. We are of opinion that there is no smell characteristic of insanity ; the former notion that this was the case has now expired, but some medical men used to say that they could "*nose a lunatic.*"

Suicide in the Monaghan Asylum.—A lunatic inmate of the District Asylum at Monaghan hung himself last week with a rope made from the straw of his bed, every other material suitable for such purpose having been removed. At the inquest the jury found "that deceased died from strangulation, having hanged himself in his bed-room by making a rope of the straw forming his bed, he being a patient in the Asylum, and of unsound mind ; and we believe that every care was taken of the deceased by the attendants and others in the Asylum."

Professional Etiquette.—We are requested to obtain the opinion of members of the profession practising in lunacy on the following question : In what cases is a medical man, whose name is well known as a "mad doctor," justified in seeing a patient without giving an assumed name? This would apply to medical men attached to large county asylums and insane hospitals, whose names are known in the neighbourhood as being so connected, and to physicians practising as specialists in towns. It must, however, be distinctly understood that the assumed name is *only* taken at the special request of the friend or relative of the patient, and to prevent any cause for excitement of the patient and so to enable the medical man to form a correct opinion of the patient's natural condition. We desire answers to this.

Stoned to Death.—A rather strange case of hallucination has occurred lately. A man appears to have become suddenly insane, and to have taken the life of a fellow creature, mistaking him for the devil. Cases of sudden lunacy have been of frequent occurrence of late, and many desperate attempts at homicide and suicide have been made by persons at large and mentally afflicted. Under this heading a paragraph has appeared in the *Yorkshire Post*, the murder being attributed to jealousy about a woman. We are now informed that there was no cause of vengeance, but that it was done with the intention of "killing the devil," as the madman joyfully said on going contentedly to place himself in the hands of the police. A piece of rock hurled with the violence of insanity against the unfortunate Leandri fractured his skull and also broke one of his arms. The maniac Peretti is shut up in the prison of Sartene, the nearest to the scene of the outrage, and he is under the strictest medical surveillance, but his insanity and violence continue unabated.

---

The success of the high classes for ladies at Odessa has exceeded all expectations. On the opening day, January 21, instead of the expected sixty or seventy students, 215 ladies were inscribed. The University has offered its rooms for classes.

---

Among recent deaths is that of M. Chauffod, Professor of Zoology at the Paris School of Medicine. M. Chauffod during his whole career opposed M. Claude Bernard's determinism, and advocated the existence of a vital principle and final causes in a number of books largely circulated.

WEDNESDAY, FEBRUARY 26, 1879.

## THE HUNTERIAN ORATION.

ONCE more the annual oration in honour of John Hunter has been delivered at the Royal College of Surgeons. The orator was one whose professorial duties must have made him feel a more than ordinary interest in the life and labours of the great anatomist. Nevertheless, however great our admiration may be of any one who has distinguished himself among all other men, it is no easy task to satisfactorily take up a theme that has already been the subject of many eloquent discourses. It is, therefore, no little praise to say that there is a freshness and vigour in Dr. Humphry's oration which cannot fail to make it interesting even to those to whom the subject is no novelty.

In reference to the age at which Hunter began those studies for which he was afterwards so distinguished, Dr. Humphry makes, at the very outset of his oration, an observation that should receive the attention of every parent who is desirous of sending his son into the medical profession. "There can be no doubt," he said, "that the profession has suffered in quality and status, as well as in practical outcome, from being commenced in many instances by lads, who had not only an insufficient mental training, but who had not the solidity of character and the tone of thought which should be present in those whose business it is to seek amid the chambers of death for the means of fortifying and prolonging life." This remark is in our opinion particularly applicable to the present time, when young men can enter the profession without serving that apprenticeship which was often an invaluable introduction to their futu work as general practitioners. When, under the old system of apprenticeship, the student on entering the medical schools, had already obtained a good general idea of the kind of practice in which he would be afterwards engaged, the age at which he commenced his medical studies was not of so much consequence. But now that mere boys, who have never handled a pestle and mortar, and who could not distinguish between rhubarb and jalap, may go directly from their Virgil and Horace to the dissecting-room and lecture-theatre of our medical schools, the early age at which many begin their professional studies is a matter of more serious consideration.

Although there is no characteristic of Hunter's life and work which Dr. Humphry has omitted to notice, he is chiefly impressed with what he justly considers to be the two salient features in the character of that great man—viz., his "observation" and "reflection." With an enthusiasm which may be excused in one who belongs to the same profession as did John Hunter, the orator exclaims: "To have made such a museum is one of the greatest of human achievements; to have thought carefully and well upon every specimen in it is far more—it is one of the greatest of human glories." After remarking that few men have worked more, experimented more, and thought more, and that "in fewer still has the balance between so large amount of work, and so large amount of thought, been through life so well maintained," notice is taken of Hunter's views respecting a question which has been the subject of controversy among philosophers and scientists of all ages. Doubtless, with regard to the questions—What is life? and, What are the properties of matter in its relation to life? there are passages in Hunter's writings to which both the most materialistic and most orthodox physiologist may appeal in support of their respective doctrines. In one place the great physiologist says: "As the causes and effects of matter seem to be entirely connected with matter itself, and to be a property in and inseparable from it, and as these are becoming better known, the 'presiding spirits' (of the ancient) are every day vanishing, and their authority becoming less." It is evident from this passage that Hunter "recognised the potentiality of matter;" although, as Dr. Humphry well observes, "he forbore to press the inquiry further into those speculations as to ultimates, those questions as to the origin of matter, and the nature of its properties, respecting which men may dogmatise and quarrel, and hopelessly quarrel on, because they are on the confines of, if not within the circle of, the unknowable." Indeed, Hunter could not rid his mind of that "something" which no materialist has been able to explain away. "Life," he says, "appears to be something super-added to this peculiar modification of matter; or this modification is so arranged that the principle of life arises out of the arrangement." The orator's remarks on this all-absorbing question are particularly interesting; but we must hasten to a subject of much more practical importance, to which he has devoted a considerable portion of his oration. We allude to the question of Medical Education.

The extraordinary manner in which the faculty of reflection was developed in the mind of Hunter, naturally suggested to Dr. Humphry the question whether our present system of medical education is such as will en-

courage in the student a habit of reflecting upon the facts with which he becomes acquainted, and of taking a thorough grasp of the general principles, the more important facts, and practical bearings of the several subjects to which he has to devote his attention. Whether, indeed, it is such as will induce the student to take a keen interest in his work, to love it for its own sake, and not merely for the personal benefits he hopes to derive from it. Dr. Humphry is inclined to think that the student's love of knowledge is rather choked than matured by our present system of education and examinations; that he, as a rule, rather flies from than clings to his work; that he is brought to the fountain and made to drink, but the draught has lost the sparkle and the refreshing quality it should have. The orator considers that the difficulty of "carrying out a rational and really beneficial system of education as opposed to what may be called cram," is to be attributed partly to the constantly accumulating mass of facts in every branch of science, and partly to the character and requirements of medical examinations. It is well observed that the great evils of examinations is their "tendency to make facts preponderate over thought, and so to add to the accumulating weight of that heap which oppresses the student and smothers his aspirations and interest in his work." We cordially agree with all that Dr. Humphry has said on this important subject. Neither has the *Medical Press*, nor have our contemporaries, failed to notice the many imperfections that are to be found both in the teaching and in the examination of the student. Some time ago we drew attention to the dry, tedious, and uninteresting style of lecturing too frequently adopted at the medical schools, and to the want of mutual co-operation and sympathy subsisting between these schools and the several licensing bodies. In the same spirit the orator remarked, "The dry bones, as Hunter would have taught them, and as Bell to some extent did teach them, not with purposeless and pedantic minuteness of detail, but as parts of a noble animal mechanism, and full of meaning, would become instinct with life, and would enlist the interest and stimulate the energies of the most unwilling student." The difficulties, however, in the way of educating the thinking as well as the learning capacities of the student, are almost insurmountable. Lecturers are not so good as they should be, or as they might be. They are seldom chosen from any special talent they may have for teaching, and they have generally too many other subjects to attend to, to devote much consideration to a pursuit which is quite an art in itself. On the other hand, it should not be forgotten that Medicine is a profession by which its followers have to earn their daily bread, and not like one of those sciences which men study from a predilection they have for them, and on account of the pleasure they derive from the many interesting facts with which they become acquainted. Even the several ways in which the "rising" physician distinguishes himself are but as stepping-stones to a lucrative practice and a position in the profession; and if the ambitious physician relinquishes his studies as soon as he has attained the object he had in view, and no longer continues the study of his profession out of pure love of it, can it be wondered at if the ordinary student seeks by the aid of "manuals" and "text-books," &c., to be conducted by a quick and easy route through the portals of the medical licensing bodies?

"What is really wanted," says Dr. Humphry, towards the conclusion of his eloquent oration, "and what teachers and examiners must combine to promote, is, in the words of Democritus, one of the greatest thinkers of antiquity, 'that we should strive not after fulness of knowledge, but fulness of understanding:' that is, that we should not so much strive after the refinements of chemistry, anatomy, and physiology, as after the fundamental facts and principles of those sciences, well welded together and well woven into the student's mind."

## EXTENSION OF UNIVERSITY TEACHING.

We have every reason to believe that the present movement in favour of the extension of University Teaching, of which Mr. Gladstone and Prince Leopold were recently the eloquent exponents, will indirectly have a marked influence upon the education of future members of the medical profession. There can be doubt that the general education of nine-tenths of the students who now enter the medical schools is not as it should be; and this, we say, while fully aware that no youth can be registered as a student in medicine until he has passed one of the preliminary examinations prescribed by the General Medical Council. It is well-known that the standard of these examinations is not very high, that a large number of successful candidates get little more than the minimum number of marks necessary to pass them, and that, with these conditions in their favour, many are rejected. And what is still more indicative of the unpreparedness of candidates who go in for these examinations, is the fact that few pass who have not been previously "crammed" in most of the subjects on which they are examined. Under these circumstances it cannot be wondered at if many youths enter the profession who are by no means fit for it, and whose slender abilities would have been turned to better account in some other sphere of life. Nor can we be surprised if, as Dr. Humphry lamented in his Hunterian Oration, medical students are so little given to habits of reflection, and that they seek by the easiest and shortest way possible, to pass their professional examinations.

We are convinced, and we speak after much experience and observation, that the superficial acquirements of many who enter upon their medical studies are to be attributed partly to the early age at which some leave school, and partly to the very deficient means of good and cheap education in the metropolis and elsewhere. As Mr. Gladstone remarked, between those who frequent the Universities, and who are at the upper end of the scale, and those at the lower end, there is a wide range of classes for whom there is a great deficiency of the higher instruction in this country. The London Society for the Extension of University Teaching will doubtless do much towards supplying this want. Nor should it be forgotten that this extension of university teaching would have a salutary influence beyond the sphere of the Universities themselves, inasmuch as it would give an impetus to the establishment of better preparatory and

grammar schools than are now to be found in the metropolis, and whose object would be to thoroughly ground the pupils in the elements of classical and mathematical learning, and so prepare them for entering higher schools and universities.

We would here refer to anorther subject closely connected with the present movement, one that has received very little attention from those who are interested in the social status of our profession. We allude to the ignorance shown by many practitioners on subjects that are not directly connected with their daily work, to the narrowness of their views and sympathies, their want of liberal tastes, their indifference to all that is beautiful and interesting in literature, science, or art. The life of that practitioner who can talk of nothing but pills and powders, or of the last interesting "case he had under his care," cannot be half so rational, noble, and enjoyable as the life of him who can relieve the tedium of his professional duties, or while away his leisure hours, by gratifying some liberal taste, or following some dignified pursuit. At the meeting above-mentioned, Prince Leopold, after alluding to the efforts which Mr. Ruskin has made to spread among the working classes the power of drawing the full measure of instruction and happiness from this wonderful world, eloquently remarks that the most admirable of the lessons inculcated by the great art-critic was, "that the highest wisdom and the highest pleasure need not be costly or exclusive, and that the greatness of a nation must be measured not by her wealth and her apparent power, but by the degree in which all her people have learnt to gather from the world of books, of art, of nature, a pure and ennobling joy." Perhaps there is no class of professional men to which these remarks are more applicable than to members of our profession. Jaded, as our minds must be with the daily routine and anxieties incidental to public or private practice, and tired, as we often are, of being continually in the chamber of sickness or of death, it is no small privilege if we can occasionally unbend our minds and give a more agreeable turn to our reflections; if when away from the bed-side we can nurture "high thoughts and elevating knowledge;" if we can indulge a taste for some natural science; if we can picture to ourselves some memorable event of the past, or, in imagination, enjoy the society and listen to the opinions of the great men who have passed away; if, in short, we can gather from the world of books, of art, or of nature, a pure and ennobling joy. For the medical practitioner to be endowed with these large sympathies and liberal tastes, he must have received that sound and liberal education which university teaching can alone afford; and, therefore, we hopefully look forward to the time when the work in which the Society for the Extension of University Education is now engaged will bear good fruit, and will be not only of inestimable advantage to the public in general, but also to the medical profession, by improving the education, enlarging the mind, and liberalising the tastes of those who enter it.

---

Since the first day of the current year sixteen members of the medical profession resident in Ireland have died.

# Notes on Current Topics.

## The College of Physicians and the Plague.

When we announced in our last issue that the Royal College of Physicians intended calling a meeting of its Fellows in reference to the appearance of the plague in Europe, we were under the impression that the College would at once appoint a committee to report respecting the nature of the disease that has been recently raging in Astrachan and neighbouring districts, and the means that should be taken to prevent its visiting this country. This step has been taken, but in compliance with a request made to the President by the Duke of Richmond and Gordon, the College has also determined upon sending a Commission, composed of three persons, to proceed to the East for the purpose of investigating the disease. Having come to this resolution, the College is prevented from making any recommendations with respect to the preventive measures that should be taken in this country until the Commission has returned from the East, and made its report to the College. This must necessarily cause a good deal of delay; so that probably the spring will be far advanced before the College will be in a position to give the Government any information and instruction on the subject. It is, in fact, open to doubt whether either the Government or the College is right in sending out a Commission of Inquiry at all, both because it is rather late in the day to adopt such a proceeding, and because the International Sanitary Commission has already obtained all the information it could wish to know respecting the origin and nature of the plague in Russia. With regard to the precautions to be taken, opinion is divided as to whether or not quarantine should be adopted as a preventive measure. But whether it should or whether it should not, it stands to reason that the Government cannot wait until the return of the Commission, appointed by the College, from the East, before making up its mind as to what steps should be taken. Indeed, the Government has already announced its intention to re-establish quarantine, on whose recommendation we know not. It cannot have been so advised by the Local Government Board, as we know the medical officer of that Board is averse to any such precautions being taken. Nor has it probably acted upon the advice of the College of Physicians, seeing that body has not made, nor cannot make any recommendations until it has received the report of its Commission. We are, therefore, inclined to doubt the propriety of the latter part of the resolution that has been adopted by the College. The task that will be imposed upon the proposed Commission of Investigation appears to us a supererogatory one. Both from the reports that have been made by foreign Governments and from the recently expressed apprehensions and reports of Mr. Netten Ratcliffe, there is very little doubt but that the pestilence now raging in the East is the true plague; and the only question that remains for our consideration turns upon the measures that should be adopted in order to prevent it extending to this country. Whether the Russian and German Governments are right or wrong with regard to the strict quarantine precautions they have taken, it will be admitted that they have acted with commendable

promptitude on the occasion. While our Government and the College of Physicians are wondering whether it is the plague, and are only now talking of sending some one to the East to make inquiries, the above-mentioned Governments have not only settled the question as to the nature of the disease, but have taken summary measures to prevent its further extension, and with such success that there is a great probability of its being confined to the districts in which it first broke out.

## The Election of Councillor for the Irish College of Surgeons.

In consequence of the death of Dr. Ledwich, the election for a Councillor, which was to have taken place on Tuesday, the 25th inst., has been postponed. A meeting of the Fellows will be therefore held on Tuesday, the 4th day of March, at one o'clock, pursuant to the provisions of the Supplemental Charter, to elect two members of Council, in room of Dr. M'Dowell and Dr. Ledwich. The ballot will close at three o'clock.

In addition to the candidates who had already announced their intention to seek admission to the Council, Dr. Thornley Stoker has declared himself as a competitor. Dr. Stoker is Professor of Anatomy in the School of the College, and Surgeon to the Richmond Hospital, and, at a former election, very nearly achieved a seat on the Council.

## The Value of a Chemist's Time.

An Irish pharmaceutical chemist in Cork, named Keating, having had to attend as a witness in a probate case at Dublin, for five days, received £5 for his time from the plaintiff, who had called him, and who gained the suit. Keating considered that he was entitled, as a professional man, to three guineas a day, and he therefore sued for the balance. In cross-examination it came out that he was a bankrupt. It was submitted that as an uncertified bankrupt he could not earn money, but on the other side it was urged that though a bankrupt could not trade, he could receive money for his personal services. On this question the judge postponed his decision.

## Quarantine in the East.

Messrs. Thomas Cook and Son have just received advice from the Austrian Lloyd's Steam Navigation Company, for whom they act as agents, to the effect that the recent reports respecting quarantine of that Company's steamers have been greatly exaggerated. The real facts of the case are that the mail steamers plying between Trieste and Egypt, Egypt and Syria and Constantinople, and Constantinople and Trieste direct, are not subject to quarantine. Therefore, passengers may visit Egypt, Palestine, Constantinople, and Athens, and return to Trieste, without the slightest fear of being detained.

Moreover, the latest intelligence gives a favourable account of the state of the plague in Astrachan, and of the measures which have been taken for stamping it out, and declares that all newspaper statements to the contrary are without foundation. The conviction is moreover expressed that after the expiration of ten days, the northern portion of the Government of Astrachan may be legitimately freed from quarantine, as an interval of forty-two days will then have passed without any cases of sickness having occurred.

## Home Hospitals.

The first annual meeting of the governors and members of the Home Hospital Association was held a few days ago at Berkeley House, Manchester Square. The chair was taken by the Duke of Northumberland, who, in a few opening remarks, drew attention to the objects and development of the Association. The first report of the Association was then read by Mr. H. H. Graham, the Secretary. It stated that the amount of funds placed at the disposal of the committee up to the present time exceeded £11,000, but that £1,116 of this sum had been spent in expenses incidental to the establishment of the Association. The lease of Berkeley House had been purchased for a term of 52½ years, and among the reasons for selecting these premises it was stated that the locality was within easy reach of most of the eminent medical men whose services the inmates would be likely to require.

We should like to know whether in using the term, "eminent medical men," the speaker was referring to the physicians to be appointed to this home hospital, and whether patients are to have the option of being attended by their own family doctors. We quite approve of the principle of home hospitals for the middle classes, but the success of the undertaking will very much depend upon the liberal spirit in which it is carried out.

## Pensions to Medical Men.

The law of Hungary grants a pension to the widows, and a gratuity for the education of the children of medical men who have died from a contagious disease contracted in the discharge of their duty. This recognition of the services and dangers of our profession does honour to this foreign State. The *Progrès Medical* advocates the extension of this favour to French physicians, supporting the petition initiated by the *Moniteur de la Policlinic* to the Chamber of Deputies.

The *Progrès* observes that it has always been opposed to the custom of giving pensions to persons for the simple reason that during a number of years they had discharged their duties faithfully, thus paying a second time for services already remunerated. In the case of medical men dying from contagious disease the circumstances are different. The physician who falls a victim to his devotion cannot be compared to the functionary who dies on duty, or to the soldier who perishes in defence of his country, his family, and himself, for the devotion of the medical man is not prescribed by any law, but is alone imposed by his conscience and his love of humanity. But the *fonctionnaire's* and the soldier's family are taken care of by their country. Should not, then, the services of the physician be recognised?

The *Progrès Medical* thus concludes its brief but eloquent appeal:—"We congratulate our *confrère*, then, on his excellent and charitable idea, and we ardently hope that the Chamber—according to his petition the reception it merits—will not for long allow foreign nations to surpass France in justice and equity." We are slow in asking favours for our profession in England, preferring the initiative should be taken by the lay public who profit by our advice. May

we hope that some of our legislators, may be inspired by this paragraph, and that England will gratefully imitate the example of other enlightened countries?

## Summer Diarrhœa.

A few evenings ago, at a meeting of medical officers of health, Mr. Shirley Murphy read a paper on this subject, to which Dr. Buchanan contributed some interesting diagrams, founded on old bills of mortality, and intended to correct an impression which he and others had fallen into, that there was difficulty of finding evidence of the existence of epidemic diarrhœa at periods antecedent to the time of registration. From these diagrams it would appear that at the end of the seventeenth century diarrhœa prevailed in London just as it has done of late years, whilst as regards the eighteenth century, the diagrams showed a greatly diminished mortality from this disease—indeed, says Dr. Buchanan, a strong presumption that during many years there was none worth mentioning.

We need scarcely remark that those facts, if substantiated by further inquiry, must have an important bearing upon the question as to what conditions we should attribute the epidemic prevalence of summer diarrhœa. We have on several occasions drawn attention to the official investigations that have been made into the causes of the great mortality from this disease in several places, and to the fact that there still seems to be a difference of opinion on the subject. The majority of sanitarians are inclined to attribute the prevalence of summer diarrhœa to bad drainage, sewer gas, impure water, and the like. We never wholly shared this opinion, and now we should like to ask those who would support the sewer gas theory how they would account for diarrhœa being so prevalent now, when so much attention is paid to drainage, and so rare during the eighteenth century, when sanitation was altogether neglected, and, indeed, an unknown science?

## Vaccination in China.

The Chinese are especially fond of vaccination, and greatly appreciate it, especially in the Southern part of the Empire. Until lately, in order to stay the ravages of small-pox, inoculation was practised, but now this is rapidly becoming obsolete, and Chinese medical students are frequently called upon to vaccinate the Chinese children, whose parents are quite willing to pay for it. Some of these students occasionally start out journeying from village to village to vaccinate all comers, and they often make a very profitable concern of it; and it is said that they earn enough to support them for the rest of the year.

## The Future of Durham University.

We hope that a new era is about to dawn upon this much neglected school of education, and that under the auspices of the learned new bishop—Dr. Lightfoot—it may become a useful centre for the spread of knowledge in the northern districts of England. We have on several previous occasions alluded to the peculiar fitness of Durham as a university site. It has glorious historic associations, and not amongst the least of its qualifications are its ample endowments. Whether the new bishop succeeds by hoisting a broom at the masthead, or by more gentle and slower measures, we shall hail the result with satisfaction, and especially in the interests of the Northern Schools of Medicine, amongst which we may include Manchester, Sheffield, Leeds, Newcastle. We shall feel satisfied if the medical department is developed to its fullest extent.

We may state without fear of contradiction, that at present a degree from Durham is not held in much esteem. This must be altered. The University must be galvanised into life; a bright future is open to it, and we trust one of the first acts of the new prelate will be an inquiry into the state of the University.

## The Plague and the Local Government Board.

It will be seen from a notice in another part of these columns that the Local Government Board have taken steps towards protecting our ports from the invasion of the plague in the event of that pestilence threatening to visit this country. The necessity of all port sanitary authorities being provided with suitable hospital accommodation, and with the means of isolating patients suffering from infectious disease, and of disinfecting their clothing and bedding, cannot be too forcibly impressed upon our sanitary authorities at a time when there is some fear of the most dreadful of pestilences gaining a footing in these shores. Without committing itself in any way with respect to the vexed question of quarantine, the Board very properly insists upon the adoption of those measures which are undoubtedly the most reliable means of preventing the spread of not only plague but of all kinds of infectious disease—namely, strict isolation and thorough disinfection. It is not, however, practicable to adopt these preventive measures without subjecting vessels from infected districts to a brief or modified form of quarantine, and such does the new "system of medical inspection" amount to, as we shall show on another occasion. Independently of the dreaded importation of plague into this country, it is well that some pressure is put upon port sanitary authorities, as there is reason to fear that the prevalence and extension of other infectious diseases are often aggravated by the want of proper accommodation for the isolation and disinfection of patients and their clothing.

We may here mention that an order has been issued by the Prussian Ministry laying down the measures to be adopted against the importation of the plague by sea into Germany. It rules that all ships coming from Russian ports shall, on arrival, undergo sanitary inspection, and makes the admission of ships at German harbours to free pratique dependent upon this inspection. For suspicious cases positive regulations are to be observed with respect to disinfection, and orders are also given for the medical treatment of the sick in the lazarettos, the enforcement of quarantine, and the interment of persons who die from the plague.

The Medical Faculty of the University of Zurich gave, last week, the degree of M.D. to Miss Draya Sjocie, from Shabats, in Servia, and the Countess Vilma Hugonai, from Teteny, Hungary.

## Doctors as Pharmaceutists.

THE *Pharmaceutical Journal* informs us that an attempt is being made by the Rochdale Chemists' Association to effect an arrangement by which the dispensing in the district may come into the hands of the pharmacists instead of being done, as at present, by the medical men. A sub-committee has been appointed, which in order to obtain reliable data to guide in drawing up such an arrangement has sent out to different parts of the kingdom a circular, containing the following three questions :—(1) Do medical men in your town dispense for their own patients ? (2) If not, are prescriptions free to be taken to any *bonâ fide* chemist ? (3) If so, how does it affect the medical man, and the public as regards fees, and does the arrangement meet with general approval ?

We wish the effort of the Rochdale Association every success, and trust that it may be the forerunner of similar negotiations elsewhere between the doctor and the chemist, and, eventually, of a complete dissociation of dispensing from medical practice. The existing combination of prescribing and compounding which is so universal amongst general medical practitioners in England is the offspring of difficulties which no longer exist. In past times doctors could not carry on their profession without dispensing medicines, the qualified pharmaceutists being few and almost altogether confined to large towns. But now a competent dispenser is to be found in every substantial town, and there can usually be no inconvenience to the patient in referring him to the chemist for his medicine. After all, there is no more natural connection between the physician and his medicines than between the artizan and the tool with which he works, and we should be happy to see the day when the medical practitioner ceases to have any personal interest in the quantity or the price of the drugs which he may order to his patient. In Ireland, as a rule, medical practice and drug compounding are entirely separate professions, and, as we think, greatly to the advantage of the patient, the physician, the pharmaceutist, and the profession at large.

## Apomorphia as an Expectorant.

DRAWING a conclusion from the fact that ordinary emetics, when administered in small doses, generally act as expectorants, the director of the Heidelberg Polyclinic made experiments with small doses of apomorphia. It was found to greatly facilitate expectoration, and to quickly remove dry and sibilant râles. It was given in doses of 1-64th to 1-30th grain in solution, the hydrochlorate being preferred.

## The Case of Mr. Millerchip.

WE deeply regret that a member of the medical profession has been found guilty of manslaughter and sentenced to four months' imprisonment with hard labour. Such a punishment, with the life-long ruin and degradation it brings to a man in the prisoner's position, is so rarely incurred by anyone belonging to our profession, that it is as shocking to us as it is overwhelming to him. Indeed, so seldom is a surgeon found wanting in duty and in humanity, and so strange and painful did the prisoner's case appear to both judge and jury, that while the latter could not help recommending him to the merciful consideration of the Court, the judge spoke in terms which evidently showed his regret at seeing the prisoner in such a trying position.

"Enough (he said) was proved to show very gross and cruel neglect on your part. While I feel that a great debt is due to the medical profession, and while I recognise the large extent of unselfish, noble, and unpaid services which they render to mankind, it is necessary—when such cases as these are brought before judges, where death is occasioned by gross neglect of duty towards the poor who cannot pay for the services of medical men—it is necessary, I say, to mark with some severity the feeling which judges must entertain of such conduct."

That the sentence passed upon this unfortunate man was a "severe" one, and that it might have been a little more tempered with mercy, few will be induced to dispute. There have been notorious criminals who, for a worse crime, have got off with less punishment. It was, perhaps, the first mistake of the prisoner's life, while the punishment will last as long as he lives. Might not the "hard labour" have been remitted to one who had probably for years worked hard for very little pay in a calling to which the whole world is indebted? Have, it may be asked, there been lately so many instances of "gross and cruel conduct" amongst members of the medical profession that it was necessary to make an example of this lone and almost unique case of professional negligence? We hope that the public have too good an opinion of the medical profession to think there was any necessity for making the punishment of Mr. Millerchip such as would deter others from showing the same amount of wilful and inhuman neglect when called upon to attend a pauper patient. Had charges of inhumanity against medical men been lately of common occurrence, we could not be surprised at it being thought "necessary to mark with some severity the feeling which judges must entertain of such conduct." As it is, we are disposed to regard the "severity" of the sentence as rather a questionable way of "acknowledging the large extent of unselfish, noble, and unpaid services which medical men render to mankind."

## The Vacant Examinership of the Irish College of Surgeons.

FOR the office of Examiner in Materia Medica, vacated by the death of Dr. John Barker, three additional candidates have declared themselves—Dr. Charles McDowell, brother of the late Dr. B. F. McDowell ; Dr. C. F. Moore, of the South City Dispensaries ; and Dr. G. Mahood Foy, formerly Lecturer on Forensic Medicine in the Carmichael School. The competitors already announced are Dr. Frazer, author of a well-known work on the subject ; and Dr. Kilgariff, Surgeon to the Mater Misericordiæ Hospital.

THE entertainment to His Grace the Lord-Lieutenant of Ireland by Mr. Smyly, the President of the Royal College of Surgeons in Ireland, has been deferred from the 8th to the 22nd of March, in consequence of the unavoidable absence of His Grace in London.

THE rates of mortality per 1,000 last week in the prin-

cipal cities and large towns of the United Kingdom were —Portsmouth 16, Newcastle-on-Tyne 19, Oldham 20, Plymouth 20, Nottingham 21, Brighton 21, Wolverhampton 21, Hull 21, Leicester 21, Bradford 22, Sheffield 22, London 24, Edinburgh 24, Sunderland 24, Leeds 25, Bristol 25, Norwich 26, Birmingham 26, Glasgow 27, Salford 32, Liverpool 36, Manchester 41, and the highest —in fact, a severe epidemic rate—Dublin, with 56 per 1,000.

---

The rates of mortality in the principal foreign cities, according to the most recent weekly returns were in Bombay 31, Madras 35; Paris 27; Geneva 28; Brussels 32; Amsterdam 24; Rotterdam 24; The Hague 23; Copenhagen 25; Stockholm 25; Christiania 19; St. Petersburgh 52; Berlin 27, Hamburg 27, Dresden 23, Breslau 27, Munich 36; Vienna 30, Buda-Pesth 42; Rome 31, Turin 30, Venice 29; Alexandria 43; Brooklyn 22, Philadelphia 19, and Baltimore 20, per 1,000 of the various populations. Small-pox caused 66 deaths in St. Petersburgh and 17 in Vienna.

---

There seems to be considerable mortality from scarlet fever in Salford and Oldham, and whooping-cough in Manchester. Four fatal cases of diphtheria were recorded in Manchester and Salford, and 2 both in Birmingham and Sunderland. Small-pox caused 23 more deaths in London and its suburbs, 27 in Dublin, but not one in any of the other large towns.

---

The Royal Institute of Sciences at Venice offers three prizes of 3,000 lire each (about £115) for three monographs, one of which will be an account of the advantages which the application of physics to medical science has brought about.

---

A public meeting of the dental profession will be held in Willis's Rooms, on Monday, March the 3rd, at 4 o'clock p.m., for the purpose of receiving a Preliminary Report of the Dental Reform Committee and a proposal in favour of the formation of a Permanent Representative Dental Association.

---

# Scotland.

Between Scylla and Charybdis.—Dr. Newth has recently published a book on "Necroscopy," and two journals have simultaneously been exercising their undoubted prerogative of reviewing it: the one, the somewhat eccentric, *Glasgow Medical Journal;* and the other, its younger, if less critical contemporary, *The Students' Journal and Hospital Gazette.* The value of criticism may be somewhat gauged by comparing these reviews. The Glasgow medical journalist's finding is: "We regret to say that, from a practical and scientific stand-point alike, we are unable to commend this book to our readers." Somebody must be immolated, and why not Dr. Newth, *pour encourager les autres*, if it is his turn? On the other hand, the more generous youth concludes: "We commend Dr. Newth's little manual to the notice of our readers as a valuable and much needed guide!" Both cannot be right. We presume Dr. Newth, in advertising his book, knows from what source to cull. He will be quite right; the world must be fought with its own rusty and useless weapons.

Greenock New Poor House and Asylum—Appointment of Medical Officer.—At a meeting of the Committee of Management of the Parochial Board, held on the 20th inst., the subject of the appointment of the medical officer came up for discussion. It was resolved to continue Dr. Wallace as chief medical officer, at a salary of £120 per annum; and that a junior resident assistant be secured at a salary of about £80 per annum, with board and rations.

Health of Glasgow.—At a meeting of the Town Council held on the 17th inst., Dr. Russell, the medical officer, reported that during the fortnight ending 8th February, there were 629 deaths registered, as compared with 602 in the preceding fortnight, representing a death-rate of 28 per 1,000 living. The number of deaths of persons aged below 1 year was 118, in place of 97, and of persons aged 60 and upwards, 135, in place of 119, as compared with the preceding fortnight. The number of deaths from pulmonary diseases was 283, as compared with 244, representing a death-rate of 13 per 1,000 living, instead of 11, and constituting 45, in place of 40 per cent. of the total deaths. The number of deaths from fever was 9, in place of 7, viz., 5 from enteric fever, and 4 from typhus. The number of deaths from infectious diseases of children was 42, in place of 44, viz., 29 from whooping-cough, 9 from scarlet fever, and 4 from measles. There were 2 cases of small-pox admitted to hospital during the fortnight, but as 1 came from Govan, through the Western Infirmary Dispensary, to the Sanitary Office, it has not been registered as a case against us. The other has, although he slept only one night in Glasgow, and is an importation from Dublin, where at this moment small-pox is extremely prevalent. This was the case of a sailor. The number of cases of fever registered was 45 in place of 29, viz., 30 enteric fever, 12 typhus, and 3 undefined. In addition to these, 121 cases of measles, 66 of scarlet fever, 57 of whooping-cough, and 15 of diphtheria were the occasion of sanitary supervision and assistance as to disinfection and other preventive measures. There have been no new cases of scarlet fever since last report.

Health of Edinburgh.—The mortality of this city for the week ending February 15th fell from 114 to 97, and the death-rate was lowered to 23 per 1,000. No death was recorded from scarlatina, and the zymotic mortality was generally low. The chief cause of mortality continues to be diseases of the chest, especially in the aged. Of the 127 births 11 were illegitimate.

Pauperism in Scotland.—From statistics that have been published by the Board of Supervision, it appears that while the number of paupers, adults and dependents, receiving relief had undergone a regular decrease from 132,927 on 1st January, 1870, to 101,136 on 1st January, 1878, the figure had mounted upon 1st January last to 103,817. The proportion of paupers to population has diminished from 3·9 to 2·8 per cent. In the parishes of Baring, Glasgow, and Govan combined, the pauperism increased from 2·4 per cent. to 2·5 during the year, and in Paisley and Paisley Abbey from 3·4 to 3·5 per cent.

Edinburgh University—Resignation of Professor Balfour.—Professor Balfour has intimated his resignation of the Chair of Botany on account of failing health. The curators are the patrons. It is understood that Dr. Dickson, Professor of Botany in the University of Glasgow, is a candidate for the vacant chair.

SUDDEN DEATH OF DR. ANDERSON, OF IRVINE.—This esteemed gentleman died suddenly in the house of a brother-in-law, in Glasgow, on the 22nd inst. He was visiting professionally in Irvine the previous day, and subsequently went to Glasgow in the afternoon. He was long a surgeon in the Royal Navy, and enjoyed a pension. This is the fourth case of sudden death amongst the medical practitioners of Irvine during the past fifteen years. Disease of the heart is supposed to have been the cause of death.

# Correspondence.

## ALLEGED FAILURE OF THE CONTA IOUS DISEASES ACTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As you have noticed my communication relating to Rev. Mr. Grant's figures, and have desired "a little proof" of the failure of the Contagious Diseases Acts, I forward you some proofs which have been placed before the Government, and therefore have not shrunk from criticism. You will add to the knowledge at present before the profession if you call upon one of the most recent advocates of the Act to prove the truth of the statement which he has made in the letter published in the *British Medical Journal* for Dec. 28, 1878 :—"I look upon the Contagious Diseases Act as one of the greatest blessings—so far at all events as poor little *children* are concerned, *physically*—that, &c."

If you can obtain any statement from the Rev. Dr. Webster, of Cork, as to the nature of this *physical* benefit from the Contagious Diseases Acts to *children*, and his proofs of it, you will be more successful than other applicants I have heard of; and by publishing his "proofs" along with those for which you are now asking opponents, you will add to our knowledge.

Your article entirely ignores the principal object of the counter-memorial to the First Lord of the Admiralty. Mr. Smith attributed the figures he quoted to Mr. Grant personally, and dwells upon his qualifications for giving them. The counter-memorial was to show that Mr. Grant had nothing to do with them except quoting them. You have not therefore laid the object of the memorial before your readers—the publication of the memorial entire would have occupied no more room than your article upon portions of it only—and would have been more candid.

Faithfully yours,

J. BIRKBECK NEVINS.

3 Abercromby Square, Liverpool,
January, 16th, 1879.

# Medical News.

**Royal College of Physicians of London.**—The following gentlemen, having passed the required examinations, were duly admitted Licentiates on February 18th :—

Bell, Thomas Arthur, 9 Falmouth Road, S.E.
Benington, Robert Crewdson, 19 Vivian Road, S.E.
Brown, Edward, St. Bartholomew's Hosp., E.C.
Burton, W. H., M.B. Toronto, London Hosp., E.
Cant, William John, Nechells, Birmingham.
Cowie, Andrew J., M.D. Penn., 127 Ladbroke Grove, W.
Davy, David Henry, Oakleigh Park, N.
Day, William White, Tadcaster.
Douglas, Arthur Latham, 5 Cowley Street, S.W.
Fardon, Edward Ashby, Middlesex Hosp., W.
Gillam, Thomas Henry, Great Northern Hosp., N.
Gillies, Niel, M.D. Kingston, 142 Lambeth Rd., S.E.
Hebert, P. Z., M.D. McGill, 142 Lambeth Road, S.E.
Hetherington, George Haynes, St. Mary's Hosp., W.
Hine, Alfred Leonard, 8 Oakley Street, S.W.
Hope, Edward W., M.B. Edin., 18 Chesham Place, S.W.
Jones, James Robert, M.B. Toronto, London Hosp., E.
Kittson, E. G., M.D. McGill, 142 Lambeth Road, S.E.
Lesslie, R. B., M.D. Toronto, 2 Storey's Gate, S.W.
Lofthouse, John, Rochdale.
McSwain, Angus, M.D. Mass., 142 Lambeth Road, S.E.

Porter, William Smith, Broomhill, Sheffield.

**College of Physicians in Ireland.**—At the last examinations the following obtained the licences in Mecidine and Midwifery :—

MEDICINE.—Patrick Francis Coghlan, John David Collier, Peter Frederick Newland, John Dominick Quin.
MIDWIFERY.—Peter Frederick Newland.

**Hospital for Sick Children,** Great Ormond Street, London.—The twenty-seventh anniversary festival of this charity took place on Thursday last, at Willis's Rooms, under the presidency of the Bishop of Winchester. The hospital was founded in 1851, and is the largest institution for children in the kingdom. It now contains 120 in-patients, in addition to 52 children at Highgate, and during last year the number admitted was 927. In speaking to the principal toast, the right rev. Chairman warmly praised the work carried on by the hospital, and advocated in expressive terms its claims upon the attention of the charitable. The subscriptions announced during the evening amounted to about £2,275. The banquet was largely attended, and was graced by the presence of a number of ladies of distinction.

# Medico-Parliamentary.

## HOUSE OF COMMONS—FEB. 20.

### NOXIOUS VAPOURS.

IN answer to Viscount Newport, Mr. SCLATER BOOTH said he had a measure prepared for the purpose of dealing with the nuisance arising from smoke and noxious vapours and he hoped before long to lay it before the House.

### THE MEDICAL OFFICER OF CLERKENWELL PRISON.

Mr. CROSS informed Dr. Kenealy that he had no objection to lay on the table the report of the Commission appointed to inquire into the case of John Nolan, who died in Clerkenwell Prison, and concerning whose death the coroner's jury returned a verdict that his death had been accelerated by repeated punishments on bread and water ordered by the governor, and sanctioned by the medical officer.

### VACCINATION.

In reply to Mr. Hopwood, Mr. SCLATER-BOOTH said he had no reason to doubt that Joseph Abel, of Farringdon, Berks, had been convicted twenty-five times, and subjected to costs and fines amounting to £35 17s. 6d., for refusing to have his children vaccinated, and he had heard from Mr. Abel quite recently that he had been served with a fresh summons for the same offence. His opinion generally speaking on the impolicy of too frequently repeated prosecutions was very well known to the House, and therefore he need not repeat it. At the same time he must say that the guardians were exercising a discretion in dealing with Mr. Abel which the law imposed upon them in the way they did. The hon. and learned gentleman asked whether he (Mr. Sclater-Booth) was prepared to ask Parliament to interfere with such proceedings. Judging from the debate and division which took place last year, he not only had no intention to apply to Parliament for such power, but there was no reason to suppose that the House of Commons would be willing to acquiesce in any relaxation of the existing law.

### THE GENERAL MEDICAL COUNCIL.

Mr. WADDY asked the Vice-President of the Council whether the Government had received from the General Medical Council the Report on the working and constitution of the Council promised in July last; if not, whether the Government had any hope of soon receiving it, and would consent (in deference to the wish for a change in the constitution of the General Medical

Council) to postpone legislation for amending the Medical Acts till this part of the subject could be included.

Lord G. HAMILTON said: The Government have not received at present any communication from the Medical Council on the subject of the working of the Council. The Medical Council referred the subject to its executive committee, and since that time there has been no meeting of the Council. The amendment of the Medical Acts as regards education, foreign diplomas, education of midwives, and other important matters contained in the Government Bill of last year, can proceed without prejudicing the subject of the Medical Council; but, as before stated, the Government desire to obtain further information before coming to a decision, and propose to institute an inquiry into the subject of the constitution of the Medical Council.

MONDAY, FEBRUARY 24TH.

THE MEDICAL ACT, 1858.—Mr. A. Mills gave notice that on Wednesday he would ask for leave to introduce a Bill to amend the Medical Act of 1858.

OUTBREAK OF DIPHTHERIA.—Mr. SCLATER-BOOTH, in answer to Sir C. Dilke, said there was no objection, if the hon. baronet would move for it, to lay upon the table the report made by Mr. W. H. Power, F.R.C.S., on the cause of the late outbreak of diphtheria in the north of London.

THE SMALL-POX.—Mr. SCLATER-BOOTH, in answer to Dr. Cameron, said that the Report of the inquiry instituted last year by the Department over which he presided into the causes of the great prevalence of small-pox in the metropolis had not yet come to his hands, but he had no doubt that important information had been obtained which would be found to lead to a useful amendment of the law, and also as to the small-pox arrangements now being made for the more carefully carrying out the Act.

## MEDICAL REFORM PROSPECTS.

WE read with sincere gratification the statement of the Duke of Richmond that it is his intention to re-introduce the Medical Acts Amendment Bill in the early days of the current week—probably before these lines are in print. His grace's declaration is a grateful relief, for we had been apprehensive that the Medical Reform Bill might have shared in the general postponement of domestic legislation which, it was supposed, would have resulted from the foreign complications of Great Britain. This apprehension was strengthened by the reply of Lord George Hamilton in the Lower House some weeks since, which spoke of the need of further information, and was redolent of procrastination. But we derive from the Duke of Richmond's early introduction of the Bill the gratification not only of the prospect of immediate consideration of the question—but that arising from the belief that the Bill is intended to pass, and that the Government have determined to throw the Medical Council overboard. Indeed, we have reason to believe that the duke is thoroughly disgusted with the tergiversation of that body, and thoroughly convinced that the indictment against it on the part of the profession is founded on reason and on fact, and is, therefore, determined to go forward towards Medical Reform without troubling himself to drag the Council along with him. Of course the Bill will commence where it ended last year, with the clause restored to it which preserves to the Licensing Bodies their tenure of existence, and with the compromise which—it is hoped—will satisfy the insatiability of the ladies' greed for doctoring. Of course the Scotch Corporations and the Queen's University will obstruct to the utmost of their power, but we are confident in the hope that that obstruction will avail nothing and that the Bill will pass. If so we shall have a Conjoint Examination and an end to the competition of corporations one against the other, and the principal object of medical legislation will have been secured.

But this advantage will bear but little and but half-ripe fruit, if, as we fear it may, the Government decides to adjourn the question of the reconstitution of the General Medical Council. To decree that medical education and examination shall be reformed is well, but of what value can such a decree be either to the profession or the public, if the realisation of it be entrusted to a body which is directly interested, and, by tradition, hostile to any such reform? It is conceivable that the Duke of Richmond will frustrate the purpose of his legislative work by placing the carriage of it in the hands of a Council for whom the initiated entertain no sentiment but those of profound distrust and contempt? We cannot discredit the Government by believing it possible, and we know that the medical profession will never accept as satisfactory a scheme of reform, which in the hands of the Medical Council, would turn out delusive and disastrous. Lord George Hamilton tells us that the educational parts of the Bill will be proceeded with, while the reconstitution of the Council is to be the subject of an inquiry. We ask when, and into what is Parliament to inquire? Is there any difference of opinion in any, even the most insignificant, section of the profession, as to the need for reform of the Medical Council? Will there be found a single witness to defend the *status quo* before such commission? Is there any material difference of idea as to how the Medical Council should be reconstituted?

We rather think not. As far as public journalism is concerned, the Medical Council had but one sympathiser, and even that friend has, this week, declared its disgust with the proceedings of the Executive Committee; and, as for the medical profession, we assert, without hesitation, that the Duke of Richmond will seek, with some care, before he finds one of its members outside the Council to advise that the body shall be left alone.

It is, however, manifest that the whole influence of the profession must be directed to prevent the postponement of this question. We cannot receive with cordiality a reform which would be no reform; and this the Duke of Richmond would give us if he gives us an educational Bill, omitting to provide for its effectual execution.

# Obituary.

## EDWARD LEDWICH, F.R.C.S.I.

THE death of the Master of one of the chief Schools of Medicine in Ireland would be a momentous event, even if Dr. Ledwich was nothing more. But he was, in addition, a man of much influence in the profession in Ireland—the professional pastor of many a medical man throughout the provinces; the senior surgeon of a leading hospital of the Irish metropolis; and an author of some note; and his demise is, therefore, an event which calls for special notice in our columns.

The "Original School of Medicine" in Peter Street, Dublin, was founded by John Kirby, nearly seventy years since. To its management his lieutenants, Thomas and Edward Ledwich, succeeded nearly half-a-century since, and, upon the death of the former, the school fell within the sole charge of Dr. Edward Ledwich, who has just departed. For very many years he was an indefatigable teacher of anatomy, and upon this science he left his mark by his authorship of the manual which bears his name. He was one of the oldest councillors of the Royal College of Surgeons, and the Senior Surgeon of Mercer's Hospital for about a quarter of a century, and was more intimately associated with the teaching and qualifying than, perhaps, any man in Ireland.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

IGNORAMUS.—In reply to your query as to why the coroner of your district withheld for the period of six months the fee earned by the medical witness at the inquest, the grand jury may have omitted to avail themselves of the powers vested in them by the 29th sect. of 9 & 10 Vict., cap. 37, which "empowers the grand jury to present you at each assizes, or presenting term, such sum or sums of money as may be necessary to meet the expenses incident to the holding of inquests till next ensuing assizes." The county treasurer takes charge of this money, and it is obvious that the intention of the legislature was, that the coroner should be empowered to pay at once all expenses "incident to the holding of inquests." A grand jury may possibly omit to present for the sum till the inquests are first held, in order to enable them in examining the coroner's account to refuse, if they can, certain charges, such as medical witness fees, the grand jury considering themselves in a better position to do so before the sums are actually paid, than if they were disbursed by the coroner when the inquests were held. On some occasions cheese-paring grand juries were taught by the going judge of assize that they have not the power to refuse payments in this way, made by the coroner, as the law vests in him the right to summon, if "he deem it necessary, a medical witness," and to pay him for his services according to the schedule of fees set down for the guidance of the coroner. The law also gives the coroner the right of holding an inquest if he deem one necessary.

EULENBERG AND GUTTMANN'S SYMPATHETIC SYSTEM.—Dr. Napier calls our attention to a typographical error which appeared in our last number under the heading "Literary Notes and Gossip," which we hasten to correct. For "errata of 155 lines," read 55 lines, &c. Dr. Napier adds, "The book in question is simply a literal reprint of a series of articles which appeared in a well-known journal devoted to nervous diseases; probably your critic, with a fine feeling of sympathy, will see in this fact some explanation of the inaccuracies which seemed to have pained him so much." Whilst thanking our correspondent for his note, we cannot but think that the very fact of the book being a reprint from type which had already appeared in another form makes it all the more inexcusable that it should be issued with such a string of errata a second time; errors being much more readily rectified in type than in MS.—ED.

Dr. MACDONALD.—The subject was referred to at length about three months back.

J. S. M.—The department do not look favourably upon men who write in favour of reform; it has often proved a bar to promotion. You had better take matters as you find them, it is the "order of merit" in the service.

MR. H. D. W.—Thanks, we are well supplied with translations just now; a little later on we shall be most happy.

A PROVINCIAL will find what he requires in our last week's advertising columns.

CLINICAL SOCIETY OF LONDON.—On Friday, Feb. 28, at 8½ p.m., Mr. Bryant, "A Case of Acute Intestinal Obstruction; laparotomy; Removal of large impacted Gallstone from the Ileum; Death from Peritonitis." Mr. Barwell, "Two Cases of Left Lumbar Colotomy." Mr. Bellamy, "A Case of Intestinal Obstruction treated by Gastrotomy." Mr. Lawson, "A Case of successful Tracheotomy in the last stage of Diphtheria." Mr. Pugin Thornton, "A Case of successful Tracheotomy in the last stage of Diphtheria." Mr. Heath, "Foreign Body (end of a Silver Catheter) in the Bladder; Median Lithotomy; Recovery. Mr. Morrant Baker will exhibit a Case in which a large Rodent Ulcer of the Scalp has been removed by Operation.

### CLINICAL THERMOMETERS.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—I am a long way from an instrument maker, and the register of my favourite thermometer has passed up into the bulb at the top of the instrument and resists all my attempts to get it down.

How can I get it down? If you can tell me how I may avoid the delay and risk of sending it to a maker you will confer a boon on

Middelburg, Cape Colony, Jan. 21, 1879. ONE WHO KNOWS NOT.

[*** If the index is at the top of the instrument a sharp jerk will generally bring it down; if mixed with the mercury, it should be carefully heated in a spirit-lamp. If the heat be too great, or too suddenly applied, the tube will probably burst. Our correspondent could obviate the difficulty in future by using the improved thermometer of Arnold's make, or that of Weiss, in both of which the index cannot change its position.—ED.

X. Y. Z.—We regret we cannot comply with the request of our correspondent. It is our rule not to make selection amongst medical advisers in particular diseases, though we are often asked to do so.

NINCOMPOOP.—M.R.C.S.E. (or Eng.) means Member of the Royal College of Surgeons of England. The Edinburgh surgical diploma is indicated by the letters L.R.C.S.Ed. There is no such title as L.R.C.S.L.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—This day (Wednesday), and on Friday, Feb. 28, at 4 p.m., Prof. Parker, "On the Evolution of the Vertebrata."

QUEKETT MICROSCOPICAL CLUB.—On Friday, Feb. 28, at 8 p.m., Dr. Matthews, "On a Mode of Displaying Objects by the Microscope, irrespective of their Size (the Micro-megascope)." Dr. C. T. Hudson, "On the Rotifers by dark-field Illumination, illustrated by Transparencies."

THE ROYAL MEDICAL BENEVOLENT COLLEGE.—All applications for admission of pensioners or foundation scholars in May next must be made at the office, 37 Soho Square, London, before March 5th.

HUNTERIAN SOCIETY.—This evening, at 8 o'clock, Introductory Address by the President, Dr. J. Braxton Hicks. Mr. F. W. Corner, "On the Hyperdistension of Abscess Cavities by Antiseptic Fluids."

### VACANCIES.

Celbridge Union, Maynooth Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, March 3.

Central London Sick Asylum.—Assistant Medical Officer. Salary, £100, with board. Applications to the Board, at the Highgate Infirmary before March 3.

Dunfanaghy Union, Dunfanaghy Dispensary.—Medical Officer. Salary, £100, with fees, and £10 as Sanitary Officer. Election, March 8.

Isle of Thanet.—Medical Superintendent for the Sanatorium, near Ramsgate. Salary, £150, with an allowance of £1 11s. 6d. per week for board. Applications to the Clerk, Board Room, Minster, near Ramsgate, before March 1.

Liverpool Royal Infirmary.—Resident Medical Officer. Salary, £100, with board. Applications to the Chairman of Committee before March 12.

Magherafelt Union, Draperstown Dispensary.—Medical Officer. Salary £115, with fees, and £15 as Sanitary Officer. Election, March 5.

Maynooth College.—Medical Attendant. Election, June 24. (See Advt.)

Ripon Dispensary.—House Surgeon. Salary, £100. Applications to the Hon. Secretaries.

Sunderland Union.—District Medical Officer. Salary, £100, exclusive of fees. Applications to the Clerk to Guardians before March 10.

Tipperary Union, Cappagh Dispensary.—Medical Officer. Salary, £110, with fees, and £20 as Sanitary Officer. Election, March 15.

Victoria Hospital for Children, Chelsea.—Assistant Surgeon. Applications to the Secretary on or before March 3.

Westmoreland Lock Hospital, Dublin.—Surgeon to the Institution. Salary, £100. Also a Resident Apothecary and Accoucheur. Salary, £80, with allowances. Elections, March 1.

Wexford Union Workhouse.—Medical Officer and Consulting Sanitary Officer. Salary, £125, and £1 a case as Consulting Sanitary Officer. Election, March 1.

### APPOINTMENTS.

BENINGTON, R. C., M.R.C.S., L.R.C.P., L.S.A., Assistant House Physician to St. Thomas's Hospital.

BIRCH, E. A., F.R.C.S.E., L.R.C.P.L., a Surgeon-in-Ordinary to the Chorlton-on-Medlock Dispensary, Manchester.

CASTLE, H., M.R.C.S., L.S.A., House Surgeon to St. Thomas's Hospital.

CLARKE, T., M.D., C.M., Medical Officer to the East Dispensary, Liverpool.

COLENSO, R. J., M.R.C.S.E., House Surgeon to the Royal Infirmary, Windsor.

DAVIES, D. S., M.R.C.S., L.S.A., Assistant House Surgeon to St. Thomas's Hospital.

DAVIES, E. E. C. C., M.R.C.S.E., a House Surgeon to the London Hospital.

FETHERSTONHAUGH, C., M.B., C.M., L.R.C.S.I. & L.M., Assistant House Surgeon to the East Dispensary, Liverpool.

GAYTON, F. C., M.R.C.S.E., Assistant Medical Officer to the Cornwall Lunatic Asylum, Bodmin.

HASLAM, W. F., M.R.C.S., L.S.A., Assistant House Physician to St. Thomas's Hospital.

HAYNES, P. O., M.R.C.S.E., an Assistant House Surgeon to the South Dispensary, Liverpool.

HIGGINS, S. McCulloch, L.K.Q.C.P.I. & L.M., Medical Officer to the North Dispensary, Liverpool.

HODMES, C., M.D., L.R.C.P.L., M.R.C.S.E., a Surgeon to the Chorlton-on-Medlock Dispensary, Manchester.

IRWIN, Fitz-John R., M.B., L.R.C.S.I., Medical Officer to the Workhouse and Fever Infirmary, and No. 1 Dispensary District of the Kilkeel Union.

LAMBERT, W. F., M.B., C.M., Medical Officer, Medical Officer of Health, &c., for the Abby Dispensary District of the Tuam Union.

MACDONNELL, M. A., M.D., C.M., a Medical Officer to the North Dispensary, Liverpool.

PITTS, B., M.B., C.M., F.R.C.S.E., Resident Assistant Surgeon to St. Thomas's Hospital.

PROCTOR, Dr. R. F. S., of Aberdeen, Medical Officer for the Parish of Belhelvie.

SANDWITH, F. M., M.R.C.S., L.R.C.P., House Physician to St. Thomas's Hospital.

SMITH, H. U., M.B. Lond., M.R.C.S., Resident Accoucheur to St. Thomas's Hospital.

STEELE, C. E., M.R.C.S.E., a Medical Officer to the North Dispensary, Liverpool.

TAKAKI, K., M.R.C.S., L.R.C.P., House Surgeon to St. Thomas's Hospital.

## Deaths.

BROWN.—Feb. 15, at Lady Lane, Waterford, Samuel William Brown, L.K.Q.C.P.I., aged 33.

CARTER.—Feb. 13, at Deal, George Redsull Carter, M.R.C.S., aged 68.

CROSSING.—Feb. 13, at Stoke, Thomas Crossing, M.R.C.S.E., aged 81.

HOUGHTON.—Feb. 12, at Dudley, John Hyde Houghton, F.R.C.S.E., aged 63.

LAYCOCK.—Feb. 19, at Willesden, Elizabeth Mary, wife of William Laycock, M.R.C.S., aged 60.

LEDWICH.—Feb. 18, at Dublin, Edward Ledwich, F.R.C.S.I., aged 65.

MERCER.—Feb. 12, at Wadhurst, William Mercer, M.R.C.S., aged 39.

QUINLAN.—On Feb. 17, at Leinster Road, Rathmines, Dublin, John Peter Quinlan, L.R.C.S.I.

SCORESBY-JACKSON.—On Feb. 9, at Edinburgh, Elizabeth Whyte, widow of the late R. E. Scoresby-Jackson, M.D., F.R.S.

WHITE.—On Feb. 13, John White, L.R.C.P.Ed., of Rich Hill, co Armagh.

# IRISH POOR-LAW INTELLIGENCE.

## IRISH MEDICAL ASSOCIATION.

REPORT of the proceedings of the Committee of Council during the four months ending 21st of January, 1879, read adopted at a meeting of the Council, held the 21st of January, 1879.

Dr. PURCELL, Chairman of Committee, presiding.

MR. CHAIRMAN AND GENTLEMEN,—During the period of four months now ending, the Committee of Council held eleven meetings.

Dr. Spencer, whom you appointed assistant secretary on the 8th October, entered upon his duties at once, and the services of the late clerk were discontinued as soon as possible.

### VACCINATION PROSECUTIONS.

It will be remembered that the circular of the 31st August, 1876, issued to the justices of petty sessions, instructing them to certify for payment of "a reasonable sum, *not as a fee, but for his expenses*, to the dispensary medical officer, if he should be required to give evidence" in prosecutions of defaulters under the Compulsory Vaccination Act, was brought under the notice of the Local Government Board, who, in reply, stated that the circular referred to was originally issued by the Lord-Lieutenant. The effect of that peculiarly ill-timed circular was very unfortunate, for since its issue the justices, who appeared almost unanimously to consider that it deprived them of the power of certifying for payment of *a fee* and expenses to the medical officer for his evidence, have, in nearly every instance since, refused to consider the claim of any medical officer for the amount of the expenses he had actually incurred, much less the fee is entitled to, at their discretion, under the 13th section of the Compulsory Vaccination Act.

The Committee of Council therefore addressed a letter to the Chief Secretary for Ireland setting forth that the effect given by the justices to the circular in question discouraged the reporting of defaulters, and so tended most seriously to frustrate the intentions of the Legislature with regard to vaccination. They therefore requested that the matter might be brought under the notice of His Grace the Lord-Lieutenant, and expressed a hope that the circular referred to might be cancelled, and that new instructions might be issued without delay to the justices.

A copy of the whole correspondence on this subject between the Committee of Council and the Local Government Board was forwarded to the Chief Secretary, who in reply stated, by direction of the Lord-Lieutenant, that "the subject is under consideration with a view to improving the position of the medical officers by legislation," and that "the circular of 31st August, 1876, was *intended to assist the medical officers in their applications to the justices for the allowance of some more reasonable compensation* than the amount of their actual expenses."

The following is the correspondence:—

Irish Medical Association,
Royal College of Surgeons, Dublin,
24th day of October, 1878.

SIR,—By direction of the Council of the Irish Medical Association, I have the honour herewith to forward to you a copy of a letter on the subject of remuneration of dispensary medical officers for their evidence in cases of prosecution of defaulters under the Compulsory Vaccination Act, which has been recently addressed by order of the Council to the Local Government Board for Ireland, and also a copy of the reply thereto received; and I am instructed to request that you will have the goodness to submit them to His Grace the Lord-Lieutenant.

The Council have directed me respectfully to point out that the circular referred to in the reply of the Local Government Board cannot fail in its effect to produce a very considerable increase in the proportion of unvaccinated persons, whilst the instructions contained in it virtually deprive the magistrates of the discretion conferred upon them by the 13th section of the Compulsory Vaccination Act, and are not only impolitic, but if persisted in, must prove at no distant time disastrous to the public health. To that policy, in a great measure, the Council attribute as much the extension, as the sad results of the epidemic of small-pox which at present exists in many parts of Ireland.

That it is neither the duty of a dispensary medical officer under any circumstances to act as a prosecutor, nor as has been suggested is it his interest, even if paid for his evidence, to act as a witness against defaulters, can hardly be questioned; nor can it be denied that in consequence of the increase in the number of persons unprotected by vaccination which will assuredly occur, extreme danger to the public health must naturally result from the positive discouragement given to those officers in carrying out one of the most important and beneficial provisions, from a sanitary point of view, ever enacted by Parliament.

The Council have directed me further to submit that it is not merely a hardship, but manifestly unjust, that the dispensary medical officers should be called upon to attend at court and give evidence without remuneration, whereby they incur considerable inconvenience, resulting from interference with their official duties, and even actual loss as regards their private practice, inasmuch as it was neither contemplated nor imposed upon them as a duty by the Medical Charities Act or the regulations of the Local Government Board; whilst on the contrary the 13th section of the Compulsory Vaccination Act distinctly provides that remuneration may, at the discretion of the magistrates, be obtained for that special service.

The Council trust that, in view of the beneficial results to the community which would inevitably follow the judicious enforcement of vaccination, his Grace will be pleased to reverse the instructions to magistrates contained in the circular referred to, and direct that the

dispensary medical officers shall in future be fairly remunerated for the service indicated, and also be encouraged in every legitimate way to carry out punctually and effectively the intentions of the legislature with regard to vaccination.

I have the honour to be, Sir,
Your obedient servant,
JOHN WILLIAM MOORE, M.D.,
Honorary Secretary to the Council.

To the Right Hon. James Lowther, M.P.,
Chief Secretary for Ireland.

---

(Copy Letter to Local Government Board.)

Irish Medical Association,
Royal College of Surgeons, Dublin,
13th September, 1878.

SIR,—I am directed by the Council of the Irish Medical Association to request the attention of the Local Government Board to the subject of remuneration of dispensary medical officers for their attendance and evidence in cases of prosecutions of defaulters, under the Compulsory Vaccination Act; and to observe that the Council have received very numerous complaints, especially of late, from dispensary medical officers, chiefly those of country districts, to the effect that they have been either directed by the Guardians, or formally summoned *subpœnâ* by the magistrates, to attend and give evidence at the hearing of cases of prosecution for the default referred to; and that, having complied, and immediately afterwards having sought to obtain from the magistrates the necessary certificate to enable the Guardians to pay them reasonable remuneration, their applications have been refused—sometimes on the ground that it was part of the duty of the dispensary medical officers so to attend and give evidence *gratuitously;* occasionally that as paid officers of the Union they are not entitled to remuneration; but most frequently, that the 13th Section of the 26th and 27th Vict., cap. 52, allows payment *only of the expenses actually incurred by the medical officers*, and does not authorise payment of *fees* for such services. The Council regret to have observed from a recent newspaper report of the proceedings of the Guardians of Ballinasloe Union that the Local Government Board appears to have arrived at the conclusion that the last cited argument is correct, inasmuch as the Board is reported to have informed the Guardians that "in all cases of proceedings brought before the Bench by direction of the Guardians for non-compliance with the Vaccination Acts, under the 13th Section of the 26th and 27th Vict., cap. 52, the justices, before whom the prosecutions are heard, may and ought to certify for payment out of the rates of any expenses incurred in such proceedings; and in ascertaining the amount of such expenses, to allow a reasonable sum, *not as a fee, but for his expenses*, to the dispensary medical officer if he should be required to attend as a witness."

And the Council are confirmed in their view of the opinion of the Board on this subject by the fact that Mr. Pelly, one of the auditors of the Board, informed the Guardians of the Cahirciveen Union, on the 11th Dec., 1877, that in future any payment made by way of fee to a dispensary medical officer for giving evidence at vaccination prosecutions would be subject to disallowance; at the same time stating, as his reason for adopting such a course, that he did not consider the 13th Section of the Compulsory Vaccination Act contemplates payment of *fees*, but merely authorises the *expenses necessarily incurred by a dispensary medical officer* to be allowed by the justices at their discretion, the auditor having evidently fallen into the error of supposing that the expenses specified are those incurred by the *witnesses*, instead of those *incurred in the proceedings*, as defined by the Act.

The Council of the Irish Medical Association, having submitted a case for the opinion of counsel—viz., Mr. Gerald Fitzgibbon, Q.C., (*a*) Solicitor-General for Ireland (whose opinion has very recently been supported by another eminent counsel), are advised—

1. That a dispensary medical officer is not bound either by the Medical Charities Act, the Vaccination Acts, or the Board's Regulations, to prosecute defaulters, or even to give evidence at vaccination prosecutions;
2. That neither the Local Government Board nor the Guardians have authority to direct him so to do;
3. That the Local Government Board has no power to deprive him of his office for not doing so;
4. That in addition to the expenses actually incurred by him, he is *entitled to be paid a fee for his evidence*, if such be certified for by the justices; and
5. That the 13th Section of the Compulsory Vaccination Act most clearly permits the payment of a *fee* to a dispensary medical officer for his evidence, as a *part of the* "*expenses incurred in such proceedings*," in the same manner as the fees of a lawyer or solicitor, if engaged in such cases by the guardians, should be paid upon the certificate of the justices.

The Council are also informed that the Local Government Board has expressed an opinion to the effect that the dispensary medical officers ought to give their evidence in such cases gratuitously, because they are interested in the success of vaccination. If, however, from this it is to be inferred that the interest a dispensary medical officer has in vaccination is of a pecuniary kind, the Council have directed me to observe that as the rate of remuneration for the trouble and time necessarily involved in each successful vaccination is very inadequate, it would rather appear to be the interest of the medical officer, from a pecuniary point of view, to have as few public vaccinations as possible to perform. And it must be borne in mind that as all the defaulters do not avail themselves of gratuitous vaccination at the dispensary, the medical officer consequently has no interest whatsoever in giving evidence against those who do not. And, further, that the mere fact of his having given evidence against defaulters almost invariably creates ill-feeling towards him, which, on the part of those who are dispensary patients, leads to a desire for retaliation—hence the frequent occurrence of harassing, even though frivolous, complaints; whilst those who were his "private patients" almost invariably resent his appearing as a witness against them by depriving him of his private practice in their families, and endeavouring (often successfully) to make their friends do likewise.

I may here call the attention of the Board to the reply given in the House of Commons, during the last session of Parliament, by Mr. Sclater-Booth, President of the Local Government Board for England, to a question put by Mr. Gray, M.P., relative to the remuneration given to public vaccinators in Ireland, when the President of the English Local Government Board stated that he "could not say what was the remuneration given for vaccination in Ireland, nor could he answer for the defects of the Irish system, but by some means or another the payment for each successful vaccination in *England* amounted to about *half-a-crown*, and he considered the money *well spent*."

I am further directed to point out that if dispensary medical officers be not fairly remunerated for giving evidence in vaccination prosecutions, it is only natural to expect that—if, instead of being rewarded for their zeal in reporting defaulters, they are to all intents and purposes severely punished for so doing—they will, as far as possible, avoid the future detection of defaulters; the certain result of which must be that even a much larger proportion of unvaccinated persons than at present existing will remain undetected throughout the country—a result which the Council, although they would deeply deplore it, nevertheless cannot fail to foresee as certain to occur. The Council, therefore, consider it a duty incumbent on them,

(*a*) Now Lord Chief Justice of Appeal in Ireland.

in the public interest, to urge that every possible means should be exercised by the Local Government Board to carry into full effect the beneficent intentions of the Legislature with regard to vaccination, whereby it was unmistakably, and most wisely, intended that every person should be, as far as possible by vaccination, protected against small-pox ; and the Council have directed me to submit that unless the dispensary medical officers are fairly remunerated for their evidence at vaccination prosecutions, it is futile to imagine that full effect will be given to the provisions of the Vaccination Acts ; and they therefore trust that the Local Government Board will promptly exert itself by representing to the justices and boards of guardians the advisability of encouraging in every legitimate way the dispensary medical officers to report punctually every instance of default—not the least of which would be to ensure payment to them for the special and extra service above referred to.

In conclusion, I am directed to add that the Council are deeply impressed with the opinion, that if the remuneration for public vaccinations in Ireland were made equal to that given in England, and the suggestions now offered were carried out effectively, no such formidable epidemic of small-pox as that which exists at present could possibly occur again in Ireland.

I am, Sir, your obedient servant,

JOHN WM. MOORE, M.D.,
Hon. Secretary to the Council.

To the Secretary,
Local Government Board for Ireland.

*(To be continued.)*

## THE HEALTH OF IRELAND IN 1878.

*Births.*—During the year 1878 there were registered in the Dublin Registration District, 9,513 births, being equal to 30 per 1,000 of the population. The average annual number for the preceding ten years was 28 per 1,000.

In London the number of births registered during the year 1878 was 129,182, being equal to a rate of 36 in every 1,000 of the estimated population ; in Glasgow, 36 per 1,000 ; and in Edinburgh 33 per 1,000 of the estimated population.

*Deaths.*—9,269 deaths were registered in the Dublin Registration District during the year 1878, being equal to 1 in 34, or 29·5 in every 1,000 of the population, against an average death-rate of 26·2 per 1,000 for the previous ten years ; in the year 1877 the death-rate was 28·0 per 1,000.

Omitting 302 deaths, which being those of persons admitted into public institutions from localities outside the Dublin Registration District are not properly chargeable to the district, the death-rate for last year is 28·5 per 1,000 of the population, the rate for the city being 30·7 per 1,000 (29·1 on the North side and 31·9 on the South), and for the suburbs 20·8 per 1,000. The rates for the several Registrars' districts range from 13·2 the rate for Blackrock, to 39·6 for No. 1 South City (Meath Street) District.

Of the 9,269 deaths in the entire district, 2,460 were registered in the first quarter of the year, 2,380 in the second, 2,008 in the third, and 2,421 in the fourth, the weekly average being 178.

The deaths registered in Belfast during the year afford a rate of 28 in every 1,000 of the population in 1871 (allowing for the probable increase in the population since that year the death-rate yielded by the deaths registered in Belfast is 23 per 1,000) ; in Cork the rate afforded by the number of deaths registered was 27 per 1,000 of the population in 1871 ; in Limerick it was 27, in Londonderry 20, in Waterford 32, in Galway 28, and in Sligo 20.

The deaths registered in London during the year 1878 amounted to 23·4 in every 1,000 of the inhabitants ; in Glasgow 24·8 per 1,000 ; and in Edinburgh 22·0 in every 1,000.

*Diseases — Dublin Registration District.* — The 9,269 deaths registered last year are 1,039, or 12·6 per cent. in excess of the average annual number for the previous ten years. An analysis of the table shows that four-fifths of the increase occurred in deaths from the two groups of causes, zymotic diseases and affections of the respiratory organs, the deaths in the former group numbering 2,065 against an average of 1,708, and those in the latter amounting to 2,046 against an average of 1,559. The deaths tabulated under the other divisions in which the causes of death are classified do not present any material difference, either of increase or decline, as compared with the average mortality in the ten years, 1868-77.

The death-rate represented by the 2,065 deaths from zymotic diseases registered during 1878 is 6·6 per 1,000 of the population ; the average rate for the preceding ten years was 5·4 per 1,000. Omitting 51 deaths of hospital patients admitted from without the district, the deaths last year from the seven principal diseases of this class amount to 1,695, or 5·4 per 1,000 inhabitants, the rate for the city being 6·1 (5·0 on the North side and 7·0 on the South), and for the suburbs 2·7 per 1,000. The rates for the several Registrar's districts vary from 1·9 per 1,000 in Blackrock to 10·0 per 1,000 in Number 1 South City (Meath Street) District.

Five hundred and fifty deaths, or more than 26 per cent. of the mortality from zymotic diseases, resulted from small-pox, which, in the preceding five years. or from the close of the epidemic of 1871-2, caused only 67 deaths.

The disease was most fatal in the South City Districts, where it caused 400 deaths ; 107 deaths occurred in the North City Districts ; 14 are chargeable to Rathmines District, 7 to Donnybrook, and 1 to Blackrock, and the remaining 21 were hospital cases admitted from without the Dublin Registration area. Fifty-seven of the deaths were registered in the first quarter of the year, 212 in the second, 165 in the third, and 116 in the fourth. These figures would indicate a gradual subsidence of the disease since the summer months, but it is to be regretted that the returns for the closing weeks of the year are not as favourable as had been anticipated.

Weekly returns of the cases of small-pox treated in the various Dublin hospitals have been received during the last eight months. From these it appears that on Saturday, 27th April, 231 patients were under treatment ; between that date and Saturday, 28th of December, 1,835 new cases were admitted, 364 patients died, and 1,58 were discharged, leaving 122 in hospital at the close of th year. It will be seen that of 1,944 cases during the above period, the respective results of which were determined, 1,580, or 81·3 per cent., made recoveries, and 364, or 18·7 per cent., ended fatally. In proportion to the number of cases, the disease was more fatal in the December quarter than in the earlier months. The highest weekly number of cases admitted during the eight months was 106 in the week ending 18th May, and the lowest 11 in that ending 2nd November ; 48 cases were admitted in the last week of the year.

During the year 333 deaths from the several forms of continued fever were registered, viz. : 98 from typhus, 189 from typhoid, and 46 from simple continued fever ; the average annual number of deaths from fever in the ten years 1868-77, was 310.

Whooping-cough caused 281 deaths, or double the average number ; scarlet fever, on the other hand, caused only 132 (67 of these were in the last quarter), against an average of 337 ; 305 deaths were ascribed to diarrhœa, being 54 over the average ; 116 deaths, 75 of which were registered in the first quarter, resulted from measles and its complications, which caused 461 deaths in the year 1877 ; and among the remaining deaths from zymotic diseases are 100 from croup, 29 from diphtheria, 20 from dysentery, 51 from erysipelas, &c.

The deaths from diseases of the respiratory organs, which, as stated above, amount to 2,046, consist of 1,479

from bronchitis, 347 from pneumonia, 17 from pleurisy, 7 each from laryngitis and asthma, and 189 which were returned as from "lung disease," &c. The deaths from these causes form 22 per cent. of the total mortality, and are equivalent to 6·5 per 1,000 of the population, against an average rate of 4·96 per 1,000 for the preceding ten years. Deaths from diseases of the respiratory organs were much more numerous in the latter half of that decade than in the earlier years; thus the average yearly number for the five years, 1868-72, was only 1,422 ; while the average for the five years, 1873-77, amounted to 1,697 ; the number in 1877 was 1,889. The deaths last year from these causes were registered as follows :—660 in the first quarter, 470 in the second, 230 in the third, and 686 in the fourth.

Deaths of children from convulsions, though somewhat over the average, are a few less than in 1877 ; they number 618, being equal to 22·6 per cent. of all the deaths of children under five years of age.

Heart disease caused 396 deaths, pericarditis 12, and aneurism 18.

One hundred and eighty-nine deaths were attributed to paralysis, 134 to apoplexy, 75 to cephalitis, 39 to epilepsy, 8 to insanity, 2 to chorea, 104 to brain disease unspecified ; 9 to hepatitis, 16 to jaundice, 106 to liver disease, 2 to spleen disease ; 58 to Bright's disease, 13 to cystitis, 8 to diabetes, 5 to nephritis, 2 to stone in the bladder, and 71 to kidney disease unspecified.

In the year 1877 the mortality from "Constitutional Diseases" was above the average, but last year the deaths in this class, although numerous, were slightly under the average; they amount to 1,575, or 17 per cent. of the deaths from all causes, and are equivalent to 5 per 1,000 of the population; they include 945 from phthisis (against an average of 980), 174 from mesenteric disease, 168 from hydrocephalus, 39 only from scrofula, 143 from cancer, 11 from gout, &c.

Two hundred and seventeen deaths caused by accidents or negligence, 12 cases of homicide, and 11 of suicide were registered.

*Ages.*—The increase in the mortality last year, as compared with the average for the preceding decade, was distributed over all the age periods.

Of the 9,269 deaths, 2,733, or 29 per cent., were of children under five years of age, and 2,161, or 23 per cent., were of persons aged 60 years or upwards, including those of 1,063 persons aged 70 years and upwards, of whom 44 were stated to have been nonagenarians, and 6 (3 men and 3 women) were returned as centenarians.

*Provincial Town Districts.*—The respective death-rates, represented by the deaths from the seven principal zymotic diseases, registered during the year in the seven provincial town districts included in the weekly returns are :—Belfast, 4·3 per 1,000 of the population, according to the Census of 1871 (or, allowing for increase since that year, 3·4 per 1,000) ; Cork, 2·8 per 1,000 of the population in 1871 ; Limerick, 2·6 per 1,000 ; Londonderry, 1·4 ; Waterford, 5·2 ; Galway, 6·1 ; and Sligo, 2·0 per 1,000.

The high zymotic rate in Galway is owing principally to the prevalence of small-pox in the second half of the year. This disease caused 85 of the 559 deaths registered during the year, and fever caused 25. In Waterford, measles during the first quarter, and whooping-cough in the first and second quarters, led to the comparatively high rate ; 71 deaths from the former disease and 52 from the latter were recorded during the year, but no death from small-pox was returned.

In Belfast, where the deaths from all causes numbered 5,152, there were 776 from the seven zymotic diseases—viz., 36 from small-pox, 204 from scarlatina (100 of which were recorded in the last quarter), 199 from fever, 209 from diarrhœa, 69 from whooping-cough, 52 from measles, and 7 from diphtheria. No deaths from small-pox were registered in the last quarter.

There were no deaths from small-pox registered in Cork during the year; the deaths from the six other zymotic diseases named above are : 75 from diarrhœa, 61 from measles (49 of which were in the March quarter), 59 from whooping-cough, 58 from fever, and only 1 each from scarlatina and diphtheria ; the number of deaths from all causes registered was 2,464.

Four deaths from small-pox were registered in Limerick, and 1 each in Londonderry and Sligo.

Forty-four per cent. of the deaths in Limerick occurred in public institutions.

## MOUNTMELLICK UNION.

WITH reference to the resolution of the board refusing to pay a fee of two guineas for examining a dangerous lunatic, the Local Government Board wrote calling the guardians' attention to the Acts of Parliament on the subject, and adding—"Where the justices made an order under their hands and seals for the remuneration of the medical officer, the guardians are bound to pay such amount, provided it does not exceed in the whole, the sum of £2." In the case under notice the justices made an order for £2, and the guardians decliined to give more than £1.

Mr. Cobbe now remarked that he knew justices who refused to sign those certificates, because they considered the people quite able to pay themselves.

Mr. Millner—I know about three weeks ago, Mr. Phillips and myself were called on in one of those cases. When we were done, the man's family applied for an order for the payment of two guineas to the doctor, which we refused to give, as we thought they were able to pay themselves.

Chairman—I do not think, as a rule, the justices exceed the guinea, except under peculiar circumstances. I know that in Maryborough in one case the doctor had to attend twice on the person, and we allowed him two guineas.

No order was made on the Local Government Board's communication.

It is obvious that the Mountmellick Guardians don't know what they talk about. The fee for examination of lunatics is restricted to those cases in which "the person shall be brought before any two justices, and it shall be proved to their satisfaction that such person was discovered and apprehended under circumstances denoting a derangement of mind, and a purpose of committing some crime for which, if committed, such person would be liable to be indicted."

For the examination of harmless lunatics there is no provision in law. The medical officer, if served with a ticket, must see them, and prescribe, if he sees fit, but it is not his duty to certify their lunacy unless paid by the friends. If he does so the magistrates cannot order, and the guardians cannot pay him.

But in the case of a dangerous lunatic, the friends cannot be made to pay, and if the magistrate certify for a fee, the guardians *must* pay.

## DR. JOHN P. QUINLAN.

WE regret to announce the death of Dr. John Peter Quinlan, which took place at his residence, Leinster Road, Rathmines, on the 17th inst., in the fifty-fifth year of his age. Dr. Quinlan was a Licentiate of the Royal College of Surgeons, Ireland, of 1848, and for over twenty-one years medical officer of the Borrisoleigh Dispensary, Thurles Union, Co. Tipperary, from which he retired in 1875 on superannuation.

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention.

### LECTURE II.

### BRONCHIAL CONGESTION, AND THE PATHOLOGICAL RELATIONS OF ASTHMA.

(*Concluded.*)

By JOHN C. THOROWGOOD, M.D., F.R.C.P.,

Physician to Victoria Park Hospital for Diseases of the Chest, and to the West London Hospital.

(*Continued from page* 139.)

ASTHMA due to, or associated with, bronchial congestion usually soon gets speedily bad when the patient lies down at night.

A small boy, æt. 9, was under my notice in 1873, who never knew anything of asthma till at the age of 4, when he passed through an attack of scarlet fever. He had no anasarca, as I was informed, but ever after the scarlet fever he remained liable to asthma, which was always worse when he lay down in bed; was relieved often by sneezing, as well as by coughing up mucus. The urine was normal, save excess of lithates. The inspiration was attended with a few sonorous sounds. A dry, bracing air did more good than any medicine in this case.

Dr. Blackley, in his observations upon himself when affected with hay catarrh, found that if he lay flat on his back he could easily bring on all the distress of a true asthmatic attack. Blackley considers congestion the sole factor of the asthma. Here, as I need not tell you, I do not agree with him. The congestion causes dyspnœa, but true bronchial asthma requires, for its production, that muscular spasm be added to bronchial congestion.

Illustrations of muscular spasm, induced by contiguity of inflamed membrane, are often brought before us. I may instance spasm of the laryngeal muscles coming on suddenly as a most dangerous complication in laryngitis. Already I have referred to bronchial spasm and asthma as a secondary neurosis resulting from bronchitis; and I may instance the case of a member of our profession, who while travelling about to get rid of a persistent bronchitis, suddenly, while passing a night at Gibraltar, was taken with spasmodic asthma; and so severely did this asthma keep its hold, that when consulting me in August last, this gentleman informed me that for 340 nights out of 365 he had had to sit up for two hours or more fighting for breath, "and you may judge what that is," said he, "to a man actively engaged in practice during the whole day." The means by which this physician was eventually much relieved will come before us again presently.

In another case, the course of events tended to a different issue, and a brief narration of the case will bring me to the question of emphysema in connection with asthma.

The patient was a clergyman of ample means, who, in consequence of very troublesome bronchitis, was sent many years ago to Madeira, whence he returned with dysentery, as an unwelcome addition to his bronchial inflammation. He told me he knew nothing of asthma till he went to Torquay, and there he was seized quite suddenly at night, and he learned that five people of his acquaintance at Torquay had all experienced severe asthmatic attacks during that same night. The case of this clergyman, referred to, I find, by Salter in his table of cases, was instructive, and illustrative of the course of many cases of asthma connected with bronchitis. First, the poor man had troublesome bronchial inflammation, which appeared to irritate the nerves from the pulmonary plexus, which Remak has shown to be distributed to the bronchial muscles. Then under some peculiar atmospheric exciting cause this muscle was thrown into spasm, and the patient surprised by a fit of asthma; and from that time bronchitis and asthma clung to him for the rest of his life. Gradually the spasmodic seizures became less severe, while very marked atrophous emphysema of lungs came on, expiration being notably difficult and prolonged. It seemed, there-

(a) Delivered before the Medical Society of London. Erasmus Wilson, F.R.S., President, in the Chair.

fore, as if spasm and inflammation together had worn out the strength of the bronchial muscle, and during the latter years of this patient's life, his distress was from over-distended lungs, impeded expiration with paralytic and wasted condition of bronchial muscle.

Few will dispute the proposition that the establishment of an atrophous emphysema of lung materially compromises the permanent recovery of an asthmatic patient. In my last lecture I laid stress on prolonged and laborious expiration as a sign that emphysematous distention of the air vesicles either was, or soon would be, developed; while, on the other hand, I also stated that where the attack of bronchial spasm was sudden, though severe, inspiratory distress marked, the patient young and free from any antecedent inflammation of his bronchi, that then we might look for a complete recovery, a statement confirmed by one or more authorities to whom I make reference.

Now, with respect to emphysema as a concomitant of asthma there is something to be said, for I am sure I have on occasions over-estimated the degree of emphysema present in the lungs, and given an unwarrantably bad prognosis of the case in consequence. Some of the latest observations published by Dr. Salter in the *Lancet* make me think he, too, was conscious of having fallen into the same error. The causes of the mistake I believe to be a want of due recognition of the causes and forms of emphysema in the first place; and, in the second place, want of attention to the way in which the diaphragm is acting. Of the forms of emphysema, first it may be a mere mechanical distention of lung, due to impeded expiration; and it is in the lung apices we notice the emphysematous signs first, as these parts suffer first from expiratory pressure. This was shown in the case of M. Groux, the man who had a congenital fissure in his chest wall, through which the movement of the lung could be observed. During forced expiration the lung came forward into this sternal fissure as a long tympanitic tumour.

Von Ziemssen, too, had the opportunity of seeing the case of a robust man, æt. 45, in whom there existed a congenital deficiency of the pectoralis minor, and of the entire sternocostal portion of the pectoralis major, so that the muscles of the four upper intercostal spaces were covered only by skin. On quiet inspiration a considerable sinking in was noticed in these situations, which was succeeded in expiration by a filling out of the same spaces; and on forced expiration these intercostal spaces were powerfully puffed out and disturbed.

When the intercostal muscle was made to contract over the space by galvanism applied, then the bulging was not observed in that one space during expiration.

The obstructed expiration due to an attack of bronchitis we know to cause a temporary over-distension of lung—an acute emphysema subsiding with the subsidence of its cause, just as the temporary emphysema of whooping-cough subsides as the neurosis itself passes away.

Salter says he is convinced that he has seen emphysema of lung come on without any antecedent bronchitis, and in this I agree, though I do not hold that emphysema unconnected with bronchitis is always a mechanical affair, and independent of nervous influence. I believe that imperfect innervation through the vagus nerve may lead to defective expiration and emphysema; indeed, experiment has shown that section of the vagus will cause slow breathing, prolonged expiration, and emphysema of the lungs. Emphysema of centric nervous origin may develop with great rapidity, as in a case recorded by Dr. Walshe, where well-marked vesicular emphysema was found in the lungs of an infant that only survived its birth by two hours. No form of bronchitis, pneumonia, or atelectasis of lung was present, "but," says Walshe, "almost immediately after birth this infant was seized with extreme difficulty of breathing, probably of cerebral origin," and so died.

In a case recorded by my former colleague at Victoria Park Hospital, Dr. Baumler (Path. Trans. xxiii.), where an aneurism pressed on and paralysed the right pneumogastric, the lungs after death were found large and emphysematous. A former distinguished President and Lettsomian Lecturer of our Society, Dr. Habershon, has paid attention to the effect of pressure on the pneumogastric nerve, and he has observed that first this pressure leads to paroxysmal and spasmodic contraction of the muscles of the larynx; secondly, to diminished muscular power, with paralysis and wasting of the laryngeal muscles; and, thirdly, to pulmonary congestion.

Dr. George Johnson has reported a case of death from an aneurismal tumour pressing on the left pneumogastric and recurrent nerves, and here the lungs were found "very œdematous," and the muscular structures of the larynx notably atrophied.

From these statements we may, I think, infer that emphysema may be developed in the lungs under defective innervation, as well as under the influence of mechanical distention of the air vesicles.

Provided the nerve failure be not due to any organic cause, these cases of emphysema, prolonged expiration, and dyspnœa may, and do, improve wonderfully often, under the influence of a tonic and bracing air, if the condition of general atony be marked; or under a pure soothing air, where intercurrent spasm comes on, and there is reason to suspect a lurking bronchitis. The way in which patients, who have been for months in a constant state of chest distension and oppression, very rapidly improve, so as to be able to run up hills in Cornwall, Ventnor, and other places, makes me believe strongly in defective innervation as a great cause of their emphysema and breath troubles. Time forbids me to quote a few cases that have impressed me much, but when I come to the medicinal treatment of these cases, I shall hope to have time to mention the excellent effects exercised by nux vomica as a medicine for them.

The really bad cases are those of atrophous emphysema. Here we find, as in the clergyman's case already reported, a history of bronchitis to weaken the bronchial muscle; next, bronchial spasm to strain and stretch the air cells; then gradually spasm gives way to paralysis, the lungs waste, air stagnates in them, the blood is badly oxygenated, the heart suffers, and, like the air cells, becomes either fibroid or fatty, and death by syncope often closes the scene. The clergyman, who was so typical an example of this sad course of events, I was told, died at last of syncope.

These are the cases where expiratory dyspnœa is characteristic and marked. Often I have heard the patients say that they want to get the air *out* of their chest; and one intelligent man remarked spontaneously, that it seemed as if a door existed, by which air was let in, but then it would not re-open to let the air out. In this man's case, chest distension was well seen, the lower chest not retracted, and the diaphragm obviously depressed.

The class of case approximates to those singular cases of asthma described by Wunderlich, where a gradually increasing dyspnœa culminates at its maximum in two or three days, with chest motionless, and hyperesonant with pent-up air, heart and liver both pressed down, the former by distended lung, the latter by distended lung and depressed diaphragm. This condition of chest is a truly distressing one to witness, and differs pretty evidently from the severe bronchial asthma, with retracted epigastrium, seen in young persons. If not relieved the patient becomes livid, and complains of twitching and jumpings in his limbs, due to the circulation of carboniferous blood through the system. The diaphragm here is deeply concerned, being depressed, and apparently in a semi-paralytic condition, and when things are thus the case is, in my experience, a most unpromising one. "That paralysis of the diaphragm is incompatible with the duration of life," as once stated, is not absolutely true, for Duchenne has clearly proved that life may hold on without serious disturbance, so long as the accessory muscles of respiration and the lungs remained unaffected, though the diaphragm be as a matter of demonstration, completely paralysed. In

a work on asthma (*a*) which I published some years ago, I have made reference to this diaphragmatic palsy and inertia as greatly adding to the intractability of emphysematous asthma; and as experience has grown, I am but confirmed in my belief. I see cases of persons with no great amount of bronchial spasm, who are always short-breathed, have weakness of voice, often tendency to vomiting, both on full and empty stomach, and whose chest and abdomen are distended, prominent, and motionless. When no actual spasm is on, the chest is almost noiseless, little air movement can be heard, and expiration is feeble and long. These are about the most intractable cases one can meet with in practice. If there be a remedy, it must be sought in climate rather than in physic.

Galvanisation in the course of the phrenic nerve has been suggested, but I have no experience to bring before you as to its success.

This peculiar condition of diaphragm has been observed in saturnine asthma, as a result of lead in the system. The importance of recognising this depressed state of the diaphragm in cases of emphysema, with or without asthmatic complication, I observe to be alluded to in the very recent work of Dr. Headlam Greenhow, on Chronic Bronchitis; and I there learn that thirty years ago Dr. Stokes, of Dublin, drew a distinction between those cases of emphysema, or, as he terms it, dilatation of the air cells, in which the diaphragm is displaced downwards, and those in which it is not so displaced.

Stokes gives the case of a young man, who had distended chest and emphysematous lungs, but yet presented no evidence of depression of the diaphragm. This young man did not suffer from difficulty of breathing in the intervals when he was free from bronchitis, and was able to take very active exercise; having, shortly before entering the Meath Hospital, walked a distance of 40 miles in one day. His chief inconvenience was the frequent occurrence of bronchitic attacks.

In the case given by Dr. Greenhow himself of a man who made well marked improvement from a condition of emphysema, complicated with asthma as a secondary neurosis (253, 254), it was observed that the abdominal muscles were in unusual activity, and so much hypertrophied that the situation of the linea alba and lineæ transversales was marked by distinct furrows, indicating the powerful nature of the expiratory effort to press up the diaphragm, and empty the lungs of stagnant air.

I trust I have thus exemplified the important part taken by the diaphragm in connnection with emphysematous dyspnœa. Till I learned fully to appreciate this, I often wondered why some cases of dyspnœa, not characterised by any well-marked attacks of bronchial spasm, were so much more incurable than other cases, where bronchial spasm was a prominent cause of complaint on the part of the patient; and I soon found that in these intractable cases there was not only evidence of lung distention and emphysema, but also very imperfect action of the diaphragm, and marked over-fulness of the lower chest. Nux vomica and strychnia, remedies so very useful in pure emphysema, were quite powerless in this condition of diaphragmatic inertia. It is worth while always to seek for a small zone of congested capillary vessels, which at times may be found on the surface corresponding to the line of the diaphragm.

Being desirous in this lecture on the Pathological Relations of Bronchial Asthma to say a few words on the true degenerative changes of lung tissue that may result from prolonged asthma, I am obliged to omit the consideration of the pathological relations of heart disease, renal disease, and gout, and proceed to degeneration of pulmonary tissue.

The question before us is, Will prolonged attacks of bronchial spasm lead to phthisical or tubercular disease in the lungs, as well as to emphysematous distension and degeneration of the pulmonary muscles?

Bronchial spasm is a disorder of function; phthisis and emphysema are diseases of tissue, and as a general rule prolonged disorder of function, sooner or later, leads to structural tissue change. While, as I have already shown, bronchial congestion may become a determining cause of bronchial spasm; so we have the reverse condition often brought to our notice, where severe attacks of bronchial spasm, relieved by inhaling burning nitre paper, exist for years before any signs of cough and bronchial congestion become apparent; a well-marked example of this course of events I have now under observation.

A man had typical seizure of bronchial spasm for years, and then began to have cough, and slowly developing symptoms of emphysema and bronchitis as a secondary effect. In seeking into these secondary effects of bronchial spasm, by far the most common is vesicular emphysema of the lungs; and some cases that have come under my notice, where persons who have been long asthmatic have eventually become phthisical, seem to me to have been examples of the extension of atrophous emphysema into a destructive process involving the lung substance. For the victim of spasmodic asthma to become really tuberculous, and die with genuine grey tubercles present in the lungs, appears a most rare event. One case I have found reported from the German, where a young student, who was liable to most intense attacks of spasm with great drawing in of epigastrium, eventually died; and a post-mortem examination showed the lungs full of grey tubercles. My own experience fails to afford any similar case; and of the cases that I have noted of patients who have died of genuine acute tuberculosis, I do not find any note of asthmatic attacks as features in the history of these cases. In a well-marked case of miliary acute tuberculosis, given by Dr. Peacock, where a young lady, æt. 22, fell ill on May 14th, and died on June 1st, there was dyspnœa, aggravated in the recumbent posture as a prominent symptom, together with great acceleration of the respirations; but I do not find any antecedent history of asthmatic seizures, and auscultation revealed nothing more than harshness in the respiratory murmur. There seemed no auscultatory evidence of bronchial stricture. Post-mortem—both lungs were more or less airless, and filled with small miliary tubercles, none of which had undergone any softening process.

I do not find any evidence to associate miliary tubercles with attacks of bronchial spasm, though we can conceive the possibility of the conjunction of the two affections in certain cases, from what we know of the causation of bronchial spasm by bronchitis and bronchial congestion.

That protracted asthma should lead to a phthisical destruction of lung, is not a common event, and yet I can find illustrations of this occurrence from my own experience, as well as from that of others.

In Salter's table of 223 cases of asthma, there appear 49 in whom there is a distinct account of emphysema of lungs, and of asthma existing in some of the members of the patient's family. In 14 cases we find history of phthisis as a hereditary disease affecting parents, brothers, sisters, uncles, or aunts, and in about half of these 14 cases the physical signs as recorded were such as would suggest the possibility of phthisis, but I only find one mention of hæmoptysis among them.

Looking over my own notes of cases where asthma has issued in phthisis, I find the termination certainly an uncommon one, and I find hæmoptysis nearly always recorded among the symptoms.

The cases prone to go into phthisis are those of persons approaching to, or fairly in, middle life, who have been for some time asthmatic, who come of an ancestry liable to pulmonary disease, and in whom the physical signs of atrophous emphysema of lungs are well marked.

The presence of small fibrinous casts of the minute bronchi in the expectoration always makes me expect a phthisical termination of the case, and there used to be in our museum at Victoria Park Hospital a most characteristic fibrinous branching cast of some of the twigs of

(*a*) "Notes on Asthma." Third Edition. J. and A. Churchill.

the bronchial tree that had been coughed up by a gentleman, who, having been for many years liable to asthma, eventually died of pulmonary phthisis.

In atrophous emphysema there is feeble nutrition, wasting of the coats of the bronchi, and the fibrinous casts formed tend to irritate and destroy the weak bronchial membrane, and so is set up ulcerative destruction of the lung. A natural inherited weakness of the bronchial membrane and air vesicles may constitute the hereditary element in the case, and such a weakness may be derived from parents affected with any form of pulmonary disease. Of three cases where I was able to get full and complete notes of asthma turning to phthisis, in one the fibrinous sputum was noted, and this was in the case of a man who died late in life, and when young had suffered much from gout.

Of my two other cases, one was that of a gentleman, æt. 60, who for years was liable to very severe spasmodic asthma, gradually spasm passed off, dyspnœa became constant and abiding, blood appeared at intervals on the expectoration, moist crepitation became distinct at right lung apex; temporary benefit followed on the use of cod-liver oil and hypophosphite of soda, but in about three years death, with all the signs of phthisis, took place.

My second case was that of a lady, æt. 21, whose father was living, and a great sufferer from bronchial asthma. The daughter, during her childhood and early youth, had also suffered severely with fits of asthma, usually relieved by inhaling the smoke of burning nitre paper. When I saw her in September, 1876, these spasmodic attacks had passed away, but she had a pulse of 120, copious purulent expectoration, at times streaked with blood, and abundant sub-crepitant râles over upper third of left lung, and hoarseness of voice. She improved more than I expected on pills of creasote and syrup of hypophosphite of lime; but rather more than twelve months after I first saw her, I heard of her death from phthisis at her home in the country.

## EXCISION OF ELBOW AND SUBSEQUENT AMPUTATION. (a)

By B. WILLS RICHARDSON, F.R.C.S.I.

WERE this Society the repertory of the histories of successful surgery only, its value as a didactic body would be very small indeed. It appears to me very much to be regretted that those who make communications, at the meetings of our societies, of the early stages of their cases, too often forget that they are incomplete by the omission of final results.

Having recently had under my observation a case in which unsuccess followed an excision of the elbow, I have here this evening the bones resected in the operation some months ago, in which disease re-appeared after the operation, ultimately necessitating amputation of the arm. They illustrate one of the difficulties with which the surgeon has to contend, and one which too often defeats his efforts—namely, the scrofulous diathesis.

The following condensed particulars of the case were prepared for me by our resident surgical pupil, Mr. Richard Sawyer:—

Margaret Johnstone, æt. 17, was admitted to the Adelaide Hospital on April 27, 1878. Both her parents are dead, and of seven brothers all are dead except one. Of the dead brothers, one died of pulmonary phthisis. She has one sister suffering from glandular enlargements in the neck. When she herself was but 9 years old the glands in her neck also enlarged and suppurated, and ulcers formed on her legs and chest.

In June, 1877, the right elbow became swollen and painful, and in April, 1878, the joint having gone from bad to worse, she entered the Adelaide Hospital for treatment.

Being a tolerably fat girl, a couple of leeches were occasionally applied over the joint whenever it was unusually painful, and gave transitory relief. Neither they, however, nor moderate counter-irritation, combined with alterative internal remedies, prevented suppuration, abscesses having formed, which contracted into sinuses leading to carious bone. At last a period arrived that operation could no longer be postponed, and I excised the joint on August 24, 1878, taking every care to cut the bones well beyond the carious surfaces.

Apparently matters progressed favourably under antiseptic treatment, until September 18, when an old abscess in the forearm recommenced discharging. Other abscesses formed in front of the excised parts, and on October 24, four sinuses had formed, and the cicatrix of the operation which was nearly complete, re-opened here and there. Injections of various kinds were tried with the sinuses and the frequent use of carbolic spray to the surface, but none were of any avail, except that they insured cleanliness. During November and December, 1878, and January, 1879, the pain gradually increased, and was so persistent, that she willingly submitted to my amputating the arm on Tuesday, February 11. The operation, I should observe, was performed under carbolic spray, and the antiseptic treatment is being carried out.

An examination of the portions of bones removed in the amputation will show you that considerable advance had taken place in the formation of a new joint, a strong band of dense fibrous structure uniting the radius and ulna to the humerus, and the radius and ulna to one another.

In the band uniting the humerus to these bones there is a nodule of cartilage and a piece of bone, but whether this is calcified cartilage I cannot speak positively. At the lower end of the humerus there is an ostitis disease nest, which formed part of the wall of an abscess that discharged itself through the sinuses. The surface of this nest was covered with a pulpy structure, and itself was the probable cause of all the mischief.

The specimen, for this reason alone, is of vast interest, for it shows the capability of a small disease nest in bone to baffle the most assiduous attention of the surgeon, and the conservative efforts of the soft structures at the seat of an excision.

## ABDOMINAL SECTION FOR INTUSSUSCEPTION. (a)

By ANTHONY HAGARTY CORLEY, M.D.

MR. PRESIDENT AND GENTLEMEN,—It requires no small amount of moral courage to bring before a Society like this the details of an unsuccessful operation, but the task becomes an obligation, when the operation is one not before done in this country. In determining to elicit an expression of opinion from the Surgical Society on a question not heretofore submitted for its consideration, I am fortified by the result of a similar proceeding occurring in the past. Nearly ten years ago, I had the temerity, in spite of the established Irish surgical canons, to perform the operation of tracheotomy in croup. In my case life was prolonged, but not saved, and the disease, unchecked, proved fatal. My paper in this Hall was subject to the most adverse criticisms, and every hostile expression of opinion was received with a favour denied to the views which I supported. Since that time I have seen them brought forward, again and again, by abler advocates, and I have seen many of the hostile critics won over—some to acquiescence, some to approval, and some to the doing likewise. If this paper be followed by like results I shall be well satisfied.

(a) Read before the Surgical Society o Ireland. The discussion will be found on page 187.

I have named my paper "Abdominal Section for Intussusception," and the case I shall detail bears out the title, but I trust I shall not be out of order, if I am obliged, in making my remarks on it, to take in a wider field and embrace the consideration of other conditions of obstruction than the one named.

W. S., æt. nine months, in excellent health, although thus late only beginning to teeth, and a fine, well-grown child, not yet weaned, was laughing and crowing on his mother's knee, at 3 o'clock on Wednesday, the 21st of August last. He was suddenly observed to grow pale and very faint, and after a little time he vomited. As he was teething the indisposition was set down to that source, and did not at first cause his parents much uneasiness. As, however, the symptoms did not diminish and as the vomiting returned after every attempt to feed him, he was brought to me at 10 o'clock that night. I observed the faintness and pallor, but as the vomiting was not a very marked symptom, and as his bowels had been moved more than once, I took the same view as his parents did; lanced over a projecting incisor where the gum was red, swollen, and tender, prescribed a little wine, and ordered a poultice to be applied to the epigastrium in case the vomiting should continue. I believed his condition was that of reflex cerebral anæmia due to dental irritation. Next morning I saw him again, and was told that there had been more vomiting, that the weakness had increased, and that a slight movement of the bowels had occurred, with traces of blood on the napkin. The symptoms of collapse were more marked, and I fully recognised the gravity of the case, although its exact diagnosis did not strike me. As I had to leave town for some hours that day I recommended that Dr. Kidd, who had attended the mother in her confinements, should be called in. He, at once suspecting the true nature of the case, made a rectal examination. As the anus and rectum were large and easily distended the finger passed readily up, and an invaginated portion of the gut was detected, between two and three inches from the anus.

*Ex post facto* reasoning may make some think that the diagnosis was easy, but I, who saw the case from the first, do not think so, and am the more ready, in confessing my own failure, to render due credit to the trained observation and *tactus eruditus* which in this, as in most other cases, have given Dr. Kidd's judgment such a weight with his professional brethren. As soon as I returned to town in the evening, I called on him and learned the result of his examination. He told me that he had not thought insufflation worthy of trial as the sphincter was a remarkably loose one, and as regards operation, the great collapse of the child contra-indicated even its discussion: though he thought if reaction set in it would be a fair case. I immediately saw the patient and found Dr. Kidd's diagnosis easily established. The child was no worse than in morning, and I made up my mind that if any improvement in pulse or strength came on I should, with Dr. Kidd's approval, propose to operate in the morning, and on consultation he agreed.

On the next morning there were some signs of reaction, and accordingly at 9 o'clock, just forty-two hours after the onset of the symptoms, I proceeded to perform abdominal section, or as it is called by our Transatlantic brethren, laparotomy. Ably assisted by Dr. Kidd, by my colleague Mr. Stokes, who fully agreed with our views, and by Mr. Hetherington, who administered chloroform, and my resident pupil, Mr. Campbell, who took charge of the spray apparatus, I opened the abdomen, from below the umbilicus to about an inch above the pubis, but subsequently had to enlarge the opening upwards. We were then able to explore the cavity. The immediate results of that attempt were anything but satisfactory. The small intestines bulged forward very much, and I sought in vain for some time for the invagination. At first we could discover no large intestine, and the lower part of the ileum stretched like a tense cord out of a thick roll or lump situated in the pelvis. This we found was the whole of the large intestine, and on raising it a little out of its position, it was seen to be an irregularly conical roll, with the ileum disappearing into the middle of its base. There was certainly a very complete invagination, but there were no signs of mischief beyond congestion. We next endeavoured to disengage the invaginated portion, and here we had very great difficulty. Whilst Mr. Stokes held the ileum (which was tense and quite immovable), and upper part of the lump, I endeavoured to draw the lower portion downwards, and had to apply my fingers to roll after roll, in a manner that suggested very much the reduction of a very tight paraphymosis. At length, after an amount of traction and force, much beyond what we thought would have been necessary, we unrolled the whole length, and, mark this, the termination of the ileum was the last portion to make its appearance. On examination, the invaginated mass was found congested merely. The intestines which had bulged out through the ventral opening were replaced with some difficulty, and the edges of the wound brought together with catgut sutures introduced by round needles. For about an hour after the operation I expected a successful issue. There was no return of vomiting, the pulse improved, and he took the breast well, but soon after he began to fail. I was inclined to suspect internal hæmorrhage, as there was paleness of surface, gasping, and jactitation. At 2 o'clock he died.

At the post-mortem examination the suspicion of hæmorrhage was removed. There was no gangrene, no ulceration, and no effused blood; but there was congestion extending from about two inches above the cæcum, to the upper third of the rectum, and, in the cavity of the peritoneum, there were about two ounces of reddish serum. The case then, was one of what have been termed ilio-cæcal intussusception and, as what I conceive to have been the mechanism of the accident, has not been given before so as to explain this case, I shall dwell on it for a few minutes, and illustrate my views with diagrams.

I observed that the ileum was the last portion to emerge from the roll; which plainly showed that it must have been, as in all reported cases, the first to have become invaginated, and it may be fairly allowed that if the abnormal process had been permitted to proceed uninterruptedly, the ilio-cæcal valve would soon, as in recorded examples, have appeared at the anus. But at the operation it seemed as if only a couple of inches of the ileum were included in the roll, and the post-mortem examination proved that such was the fact, as evidenced by the amount of the gut marked by congestion. Now, if a regular and uniform invagination had taken place, by the time the end of the ileum would reach the anus exactly one half of the entire length of large intestine would be invaginated, and of course, the same length of ileum would be included within the invaginated portion, instead of the limited piece we found. My reading of the conditions found at the operation as well as shown by the post-mortem is, that it commences as an ilio-cæcal intussusception, and that there was a series of invaginations following—thus explaining the shortness of the tumour, the small amount of ileum involved, and the difficulty of reduction. That an intussusception may occur, it is required to have a contracted portion of gut and immediately succeeding it a dilated portion. The proportional relations of the ileum and cæcum as to calibre give this, and whilst forming an anatomical predisposing cause, explain the commencement. The sacculated natural state of the whole of the colon down to the sigmoid flexure give a succession of similar causes. The involved portion of ileum passing through the cæcum is carried for some distance through the ascending colon, producing contraction, by its pressure, of the containing bowel on the contained, but in order to proceed, the tract beyond the intruding portion must remain for a while dilated. This dilated portion is large enough to contain, not only the piece of small intestine and its immediate covering, but also the outer and, as yet, only enveloping folds of large intestines.

Another intussusception then occurs. Two tubules are first involved and subsequently four, and then six—thus eventually would be formed a hard, short mass contain-

ing a small piece of ileum in its centre, and having the large intestine in irregular lengths of concentric double rolls surrounding, as it were a kind of telescoping.

I believe this is the way in which my case occurred, and the diagrams will serve to explain my meaning. They will also explain the difficulty of reduction and give a reason for Jonathan Hutchinson's remarks, quoted further on. As regards the cause of death, I can attribute it to shock, but will presently quote a high opinion on it. The exposure of intestines, in addition to the force necessary for reduction, were too much for a child of such a tender age, already shaken by forty-two hours' suffering. An earlier operation, of course, would have held out more hopes, but Dr. Kidd and I were perfectly in accord as to its inadvisability, owing to the collapse present.

It is quite plain, too, that any other means must have failed, and it is to be remarked that the intussusception reached the rectum in, at the most, twenty-one hours, and possibly before that.

As there was no ulceration or rupture of blood vessels, I can only account for the subsequent effusion of the reddish serum by assuming that many of the minute blood vessels in the invaginated intestines were obliterated, and that increased blood pressure in the remainder resulted in dilatation, with thinning of their walls, and consequent effusion.

This view of the mechanism of my case of intussusception, and probably of others, is one that can be tested in the future by observation during operation, and the result of post-mortems where no surgical interference has been attempted.

Since I wrote this description, I read a case reported by Mr. Hutchinson in the 59th volume of the "Medico-Chirurgical Transactions." It resembles mine in almost every particular, and the explanation of it, as far as I can understand, is probably the same. One point he dwells on which I did not particularise, namely, that when we tried to draw on the ileum it seemed quite fixed—thus he had to unroll from below upwards, and with the intention of bringing this mechanical part of the subject before the Society on another occasion, I leave it now. I wish for a discussion on the merits and results of abdominal section for obstruction, especially intussusception, and shall offer a few observations justifying this procedure, asking a trial for it in suitable cases. That very able surgeon, Mr. J. Hutchinson, has laid down a number of conditions influencing us in considering the subject, and has been accused of erring on the side of caution. When I shall quote his words, it will be seen that the particular case I operated on is that in which he says, "no other treatment than that of operation holds out any hope of success," and that opinion from him is enough in justification. When I add that, amongst the few operations recorded, there have been some successful cases, I think there is inducement enough to interfere even at the earliest period, especially in cases like the present, in which nothing short of an operation gives the patient a chance.

As has been rightly remarked, the cases of obstruction naturally divide themselves into two classes—chronic and acute. I shall not attempt to give an exhaustive list, but shall name the most important. The former includes obstruction from impaction of intestinal contents—be they what they may—malignant and other strictures and tumour. The latter comprise intussusception, volvulus, internal hernia, or constriction by bands, appendices, or diverticula. I exclude the ordinary forms of surgical hernia, because, although there may be some cases in which abdominal section may have to be considered (see Mr. Annandale's case, *British Medical Journal*, Feb. 8, page 194), the majority are to be treated on accustomed principles. About the chronic cases we have time for consideration. Purgatives, &c., including the free use of belladonna, opium, galvanism, and large enemata, present themselves as modes of treatment. What is looked on as the comparatively mild measure of colotomy will cure or prolong life in the more severe cases, but in chronic cases the question sometimes arises, Is the patient to be allowed to die without an effort to make sure of the cause? and possibly to remove it. But the acute cases are those that more immediately concern us. We have to ascertain, as far as possible, the cause. We are to learn from experience how far we can trust Nature to remove them, and next we must have a sufficient number of recorded operations, with their results, to form a just estimate of their danger and their value, as compared with masterly inactivity. I honour the man who, in the days before antiseptic surgery, had the hardihood to propose, and the courage to attempt, cutting into the abdomen for acute obstruction. Even up to my own student days the general peritoneum was a sacred structure, to touch which, except in the case of ascites, we were taught to hold almost a profanation. But the success of ovariotomy, as it became established, began to encourage the idea that when necessary, that membrane might be freely incised. In order to give proper value to the advantages of operation, it is necessary to dwell for a moment, first, on the frequency of cases of obstruction, and next, on the probability of a natural cure.

The statistics collected by Lichenstern, from the mortality returns of England, Geneva, Vienna, and St. Petersburgh, for a period of six years, show that out of every 100,000 inhabitants, from five to 10 die yearly of intestinal obstruction (excluding hernia and malignant disease). The English returns give one death out of 260 to this cause. As there are differences of return, the writer contents himself by assuming one death in 300 to 500 as indicative of its frequency. Independent reasoning makes me think the English return is nearer the truth. Of the various causes, according to the same authority, intussusception stands first. Out of 1,363 cases collected by him from every cause, and these are many, no less than 442, or 32·4 per cent., were cases of intussusception. My principal reason for thinking the higher figures correct is, that I believe, from personal experience, many cases die undiagnosed, and post-mortems in private are rare. The next question is, What are the chances of such cases when left to Nature? Lichenstern says, "There is no cause of acute occlusion of the intestine which cannot spontaneously disappear as well as originate. An intestinal knot can loose itself, an incarcerated or strangulated loop can become free, an invagination can become disengaged, twisting or dislocation of the intestine with angular bend can straighten itself;" . . . . but "the number of these spontaneous cures is exceedingly small, when we compare them with the mass of cases that have ended fatally, and we must describe the prognosis of internal occlusion of the intestine as in *the higher degree unfavourable*, and ileus as—to use De Haen's words a '*morbus terribilis, creberrime letalis*,' . . . the most common termination of occlusion of the intestine is fatal peritonitis with or without perforation." "Death," he says, "in cases of occlusion of the intestines, whether general peritonitis precedes it or not, is, in most cases, due to arterial anæmia of the brain (often associated with cerebral œdema), and to consecutive paralysis of the heart and respiration." "This duration," he continues, "is on the average six days, and varies from eight hours to 13 days." These are the words of one who is, on the whole, an opponent of operative interference.

It is true that recoveries may, and do take place, when we have diagnosed complete obstruction, but in all of them, except one, is not the termination open to the objection that the diagnosis might have been an error, and that, in the absence of post-mortem proof, we refuse to accept it? This exception I have alluded to is intussusception into rectum, or when after the discharge of a piece of intestine, the patient recovers. I grant that there are many cases of this kind on record. Many have been recorded in this city, and I have seen one myself. If we refuse to operate, even in cases of intussusception, what other course is open? Allowing the use of insufflation, large enemata, position and taxis, in the latter cases, and

summing up all the advice as to treatment, even in Leichenstern's exhaustive essay, we are practically told to rely on opium and expectancy.

But is a natural cure a termination to be relied on, or is it an *ignus fatuus* that lights us away from the only certain one—viz., removal of the cause? To borrow an illustration from my obstetric friends, is it like that spontaneous evolution by which Nature has occasionally effected a delivery in cross-birth, but which, were the medical attendant to trust to alone, or even principally, he would, indeed, justify the quotation "*rusticus expectat dum defluxid amnis.*"

In certain cases we have no choice but to wait, but even when by sloughing, the separation of the occluded portion is accomplished, much danger immediate and remote remains. I should certainly like to know more of the subsequent history of the cases which have recovered after this process, and it is a most important fact to remember that the earliest age, according to Meigs and Pepper, at which this *mode of cure is recorded is thirteen months; a case reported by Marage.*

Now as regards operation. Without going as far as Mr. Teale, whose words I shall presently quote, I think it will be allowed that within the last few years, our ideas as to the danger of opening the peritoneum, have been very much modified, and an amount of success has been obtained in operations involving this procedure almost unexpected.

Mr. Teale says, "exploration of the abdominal cavity is, to my mind, justifiable on two cardinal grounds. Firstly, the mere opening of the peritoneal cavity is not necessarily a dangerous operation. Secondly, there are many cases of obstruction of the bowels which must prove fatal unless relief can be given which can *only be rightly directed by the exploration* of the *abdominal cavity.* As to the impunity with which it may be opened, I need hardly remind you how constantly this is proved in operation for hernia. We think nothing of pulling out and handling coils of intestine" (from this I beg leave to dissent). He then goes on "it is a common saying that it is not the operation which proves fatal, but the delay in operating, in other words, the damage to the bowel by delay, not the damage to the peritoneum by the operation." He then relates his own cases, one of which in an adult was successful, although the obstruction was a cancerous stricture of the sigmoid flexure, for which he was obliged at once to perform left lumbar colotomy.

Dr. Clifford Allbutt, of Leeds, in commenting on Mr. Hutchinson's objections to the exploration of the abdomen, says "there we can reach the issue between Mr. Hutchinson's canons and the teaching of the Leeds surgeons, and I cannot hesitate to support the practice of my colleagues in this matter. Let us, I repeat, make our diagnosis certain, and if we do this, and for the most part we can, by close attention to the history of the case, the signs, the symptoms, and the age of the patient; then I say the indications for operation will be as clear as in the case of strangulated hernia. To deny operation to a case of internal hernia is, in my opinion, to deny the patient some fair chance of life. Mr. Teale's views represent those of Mr. Wheelhouse, Mr. Jessop, and Mr. Atkinson. "I may further refer to the two admirable papers in the second volume of the New York Pathological Transactions, and to the successful cases reported by Drs. Hutchinson, Marsh, Sands, and Howse; that of the last being almost identical in history with my own. It is right to say that the foregoing observations of Dr. Allbutt, chiefly refer to what Mr. Hutchinson says of abdominal section in obscure cases. As regards the operation in intussusception, Mr. Hutchinson speaks thus: "My own opinion is, however, definite, and in any such case, enemata, insufflation, and other measures, having had patient and repeated trials, I should not hesitate to open the abdomen. I have done this in two cases, and in one of them with perfect success; and successful cases have also been recorded by Mr. Howard Marsh, Mr. Howse, and other surgeons. In the peculiar form of intussusception, beginning at the cæcum and advancing until the inverted ilio-cæcal valve presents at the child's anus, I should suspect that an *operation will always be required,* for I know of no reliable record of the recovery of such a case either by gangrene or by the measures to which we may apply the name of rectal taxis."

May we not hope that in these days of careful antiseptic surgery cases will arise which the surgeon may fairly at once diagnose as irremediable except by operation, and that he will no longer be debarred from interfering.

In conclusion, let me say, sir, that I feel that I have done but scant justice to the subject of my paper. The limit of time allowed me must be my excuse. In good truth I have gone over piles of literature, and I could have dwelt at much greater length. I trust we shall have the subject brought before the Society again and again, with recorded cases of operation more successful than my own. (*a*)

## HOSPITAL LARIBOISIERE, PARIS.

*Intra-Peritoneal Hæmorrhage in a Woman pregnant eight months and a-half.—Sudden Death.—Cæsarian Operation—Extraction of a Living Child.*

By M. M. C. MAYGRIER.

Under the care of M. FEREOL.

MARIE PHILLIPE, æt. 31, was admitted May 3rd into the above hospital. She had worked for more than twenty years at the making of hats, and was constantly exposed to mercurial absorption, and presented manifest signs of mercurial poisoning, as excessive general trembling, tremulous voice, ginivitis, suppuration of gums, loss of teeth, &c. These complications were of ancient date, the patient often being compelled to absent herself from the workshop. For the past eighteen months the symptoms had increased in intensity. There was no syphilitic, alcoholic, or paludian poisoning. Ten years previously she had been pregnant, and went on to full time, the child dying some months after birth. She is now *enceinte* for the second time, and about seven months advanced. The child is living, though the *battements des cœur* are weak.

During her sojourn in hospital the mercurial trembling diminished, and the state of the gums improved, under the treatment by tonics, iodide of potassium, and sulphur baths; but a considerable degree of œdema of the lower limbs, extending even to the abdominal walls, came on. At the same time a little ascites existed. Urine free from albumen. Nothing particularly noticeable about the other organs.

On the 16th June, at six in the evening, whilst on duty we were called to this patient, who was in a state of syncope, which almost immediately terminated in death. Auscultation revealed that the child was alive, the heart-beats being clear. On examining the neck of the uterus it was found impossible to dilate it without great sacrifice of time, and as the pulsations of the fœtal heart were becoming feeble, Cæsarian section was performed. This was done about ten minutes after the death of the mother. Scarcely was the peritoneal cavity opened, than there was an escape of blood, mingled with serosity and numerous clots. The uterus was opened in the median line, and a male child extracted. The heart was beating, but insufflation had to be practised for an hour and a half to completely establish life.

The autopsy was made on the following morning. The

Journal,* January 26, 1878, August 31, 1878, January 11, 1879, February 8, 1879. "Guy's Hospital Reports," 1868. "New York Pathological Transactions," vol. ii. Meigs and Pepper, "Diseases of Children."

thoracic organs were healthy, the heart was in syncope and did not contain one drop of blood. The abdominal cavity was filled with blood and clots.

We were struck by the excessive size of the spleen and the smallness of the liver, the former weighing about 1,500 grammes, the latter 900 grammes. The splenic vein was very dilated. At the top of the hilus of the spleen, it bifurcated, one branch following the normal track of the splenic vein, the other, enormously dilated, anastomasing as it passed behind the stomach with the emulgent vein of the right side. The latter was enormous, and received the right utero-ovarian vein.

The walls of these veins were in places very thin, and the hæmorrhage probably occurred from this cause. The left renal vein was of ordinary size, and the inferior vena cava was of normal calibre.

A microscopical examination of the liver was made by M. Ch. Sabourin, and showed there was no cirrhosis. The tissue of the spleen was normal, though hypertrophied. Finally, the kidneys were healthy. This case is interesting on many grounds.

1st. On account of pregnancy arriving at term in a woman suffering from chronic mercurial poisoning.

2nd. As Cæsarian section was performed *ten minutes after death of mother*, allowing the extraction of a live child.

3rd. On account of the excessive volume of the spleen and the presence of intra-abdominal veinosities, which led to frightful hæmorrhage, either through mechanical rupture, or alteration of the venous walls.

## EPIDEMIOLOGICAL SOCIETY OF GREAT BRITAIN.

### THE PLAGUE IN RUSSIA.

A SPECIAL meeting of members of this Society was held last week in the Council Room of University College, Gower Street, London, Surgeon-General JOHN MURRAY, M.D., the President, in the chair, when two papers were read bearing upon the plague in Russia.

The first paper was read by Mr. J. NETTEN RADCLIFFE. The communication was entitled—

### OBSERVATIONS ON THE REAPPEARANCE OF PLAGUE IN EUROPE,

and in the course of his remarks the author said :—The great drama enacted by the plague for over a thousand years (to use the words of August Hirsh) closed in Europe in 1841 ; in the Levant generally in 1844. A century and a half of freedom from the disease in this country, and in the greatest part of Western Europe, had not effaced the popular terror of it when the malady disappeared from all its most ancient haunts, and Europe and the Levant believed themselves to be freed from an evil which had scourged their populations for many generations. They believed, however, doubtingly, as is shown by the retention of their laws against plague unmodified, and by the state of preparedness maintained with regard to them. Moreover, certain prescient physicians held that the disappearance of plague gave no warrant for its permanent extinction. Among this group of far-seeing men our venerated member and former president, Dr. Gavin Milroy, stands pre-eminent. In 1853, ten years after the disappearance of plague from its familiar haunts, the disease showed itself anew in the East ; and in the course of the twenty years 1853-72 a series of outbreaks occurred of interest, as it first seemed, rather to the epidemiologist than to the international hygienist. Outbreaks occurred in Western Arabia, 1853; the district of Bengazi, Regency of Tripoli, North Africa, 1858-59 ; Persian Kurdistan, 1863 ; Mesopotamia, 1867 ; and Persian Kurdistan again, 1871. The outbreaks occurred in localities widely separated from each other (not even excepting the two in Persian Kurdistan), and they were curiously circumscribed ; but the information we possess with regard to them leaves no reasonable doubt that they were outbreaks of bubonic (true) plague. In the winter of 1873-74, and spring of 1874, a new phase of development, so to speak of the resuscitated plague began. Within this period the disease broke out in three different countries of the East, all of which had suffered from the malady in the earlier period of its reappearance. These manifestations occurred practically contemporaneously in Mesopotamia, Western Arabia, and in the district of Bengazi, North Africa. The outbreaks in Western Arabia and Bengazi affected, more or less, the localities in which the disease had prevailed in 1853 in the former country, and in 1858-59 in the latter ; and they were as circumscribed as those of the years last named. The outbreak in Mesopotamia occurred on the verge of the locality which had been the scene of the outbreak of 1867, and in its progress included that locality. But this outbreak of 1873-74 proved to be the beginning of a prevalence of the disease, which continued throughout the years 1874, 1875, 1876, and 1877, the area of diffusion extending each year until 1876, when it included the whole of Turkish Arabia (Arak-Arabi) bordering upon the rivers Euphrates and Tigris, and extending between the Euphrates and the Syrian Desert. In the first year of prevalence, 1876, it is estimated not less than twenty thousand persons in the infected districts were killed by plague. The loss of life in Bagdad from the disease during the years 1866-67 probably exceeded five thousand. While this diffusion in Mesopotamia was in progress, and in the year 1876, plague broke out early in the year in the Shuster district, Khuzistan, South-west Persia, killing there about two thousand five hundred people. Later in the same year the disease showed itself in one of its former haunts among the Himalaya mountains, North-Western India, namely, in the district of Kumann, and prevailed there several months. About the same time cases of plague in isolated instances or in groups, were recorded in Northern Persia, in more than one locality of the province of Astrabad ; and in the spring of 1877 the malady declared itself in the province of Ghilan, attacking more especially the capital town, Resht, and the surrounding district, where it is estimated to have killed some four thousand people before the close of the year. The same year cases of plague probably occurred at Baku and other places on the Caspian littoral of Caucasia ; and it has recently been made known that the disease, also in the same year, was scattered widely in European Russia—thirty-two cases of the malady were reported to the Medical Department of the Imperial Government as having occurred in the south-western province of Tchernigew, and forty-one cases in the north-eastern province of Viatka, the total cases officially reported in the empire numbering two hundred and forty-one. An official telegraphic report from Tsaritszin, on the 17th ultimo, stated that the plague had ceased throughout the infected district. Nevertheless measures were being actively carried out to enclose it with a sanitary cordon, which it was hoped to complete by the 27th ultimo. The extraordinary measure has, moreover, been taken, under a ukase, dated February 13th, 1879, of declaring the infected district in a state of siege, that is to say, under military law ; and a governor-general has been appointed over the provinces of Astrachan and the neighbouring provinces of Saratov and Samara, with exceptional powers (that of proclaiming any part or the whole of these provinces in a state of siege among others), in order to secure the greatest promptitude and efficiency in the execution of any measures which may be deemed necessary against plague. Eight villages or districts are reported to have suffered especially during this outbreak, six on the right bank and two on the left bank of the Volga. All the places lie between Astrachan and Tsaritszin, and the infected area appears to extend about a hundred and fifty miles along both banks of the river. The data as yet received do not admit of any general

statement being made of the number of persons attacked and the loss of life.

The second paper was contributed by Dr. E. D. DICKSON, physician to the British Embassy in Constantinople, and was read by Mr. T. THORNE, one of the hon. secretaries of the Society. The paper was entitled,

ON THE CHARACTERISTICS OF PLAGUE IN MESOPOTAMIA IN 1876 AND 1877,

and in the course of it Dr. Dickson said—The sudden and alarming announcement of an outbreak of plague in Asiatic Russia, the possibility of this scourge extending into Europe, the conflicting opinions that seem to be entertained concerning the nature of the malady, and the precautions necessary to ward it off, have prompted a brief sketch, derived almost entirely from notes taken and kindly given me by Dr. Giovanni Cabiadis, as the result of his observations at Hilleh and Bagdad during the outbreaks of plague in 1876-77. Two or three months previous to the manifestation of plague in Mesopotamia, glandular swellings free from fever prevailed in that country. They showed themselves in the groin, armpit, or neck, and were not accompanied by other symptoms. They began to appear amongst the inhabitants about the end of autumn, and continued through the winter; but towards the end of it plague broke out, and reached its acme of intensity in the spring, and died out suddenly during the summer season, when the great heat declared itself, and the thermometer rose to 45 or 50 deg. of centigrades scale. During the prevalence of the plague the thermometer ranged between 5 deg. and 30 deg.; and when it rose to 30 deg. the disease had reached its maximum of intensity. As the temperature increased from 30 deg. to 45 deg., the epidemic began to diminish; and as soon as the thermometer got up to 45 deg. it ceased abruptly. On the cessation of plague, apyretic glandular swellings reappeared again, precisely similar to those which had preceded the outbreak; and they continued to manifest themselves for about two months longer. The symptoms that characterise plague are of two orders—local and general. In severe cases the general symptoms precede the local manifestations. The patient is suddenly seized with high fever, which in some instances is ushered in by a prolonged shivering fit; the pulse beats 130, or even more; and the temperature of the body rises to above 42 deg. centigrade. In some cases, however, this febrile condition is hardly appreciable; while, on the other hand, alarming complications indicate the severity of the attack by perturbations connected with the nervous centres, or with the circulating system or assimilative organs. The nervous agitation which sometimes ushers in an attack of plague is a very remarkable symptom, and one that Dr. Cabiadis had never met with before. He describes it as a prolonged regular shake, lasting from six hours to three days. While the patient is suffering from it he does not complain of cold, nor does the thermometer indicate a lowered temperature. The pulse is small, short, and quick, and the temperature of the body remains in nearly its normal state. This tremour is always followed by profound coma, during which the patient rapidly sinks. Dr. Beck and a few other physicians, basing their views on the intercurrent phenomena manifested in some cases of plague, imagined that this disease might be merely a variety of the pernicious fevers engendered by the malaria poison. But Dr. Cabiadis cites three facts which conclusively subvert this hypothesis:—Firstly, no intermission has ever been observed in the symptoms of plague, not even in those intercurrent phenomena which arise from complications of the nervous, circulating, and assimilative organs; secondly, there is no instance on record of an attack of plague having been cut short by the administration of sulphate of quinine; thirdly, the striking difference which marks the expression of the countenance and the general aspect presented by a person suffering from an attack of pernicious fever and that of one suffering from the plague. On coming up to a patient suffering from an attack of pernicious fever, you are struck with the gravity of his case and the danger threatening his life. The very reverse of this meets your eye when you see, for the first time, a case of plague. Even the worst instances of this malady are apt to deceive an inexperienced physician, and make him fancy that the case is free from danger, when in reality the patient has only a few hours to live. With regard to the debated question of contagion, I beg to draw attention to the conclusions arrived at by Dr. Cabiadis, and which are derived from a careful study of the facts that came under his observation during the two last outbreaks of plague in Mesopotamia. Dr. Cabiadis neither attempts to deny the contagious properties of plague, nor does he accept unconditionally the assertion of those who pretend that you must keep at a distance, say of six metres, from the patient, in order to avoid contracting the disease. The experience acquired by him during the epidemic outbreaks of Hilleh and Bagdad has convinced him that no great risk is incurred in touching persons with the plague, provided you avoid exposing yourself for any lengthened period to the atmosphere of the apartment occupied by him. As a proof of this doctrine, he says, that those persons who lived in the same house with a plague-smitten patient, but who avoided touching him or his clothes, through fear of catching the infection, generally did get the plague; whilst those who lived in houses exempt from the malady, but who visited plague patients, and handled them freely, without remaining long in the same room with them, hardly ever caught the disease. When plague entered a house it seldom spared its inmates, and often carried them all off within a week's time. In noting these facts, Dr. Cabiadis was careful to take into account the various tenets of the different religious sects of the people of Bagdad. For, while the Mahometans, discarding all sanitary precautions, lived with and handled plague patients, the Jews and Christians, on the contrary, firmly believing in its contagious properties, very seldom touched them. Yet all of them equally caught the disease if they lived in the same house with the plague patient, but were safe if they quitted the house the moment a case of plague occurred in it. Dr. Cabiadis quotes another remarkable fact in support of his theory. With one exception, none of the physicians, surgeons, or assistants who daily attended on plague patients caught that malady, and he himself handled nearly two thousand plague-smitten persons without suffering any inconvenience from it. To this it might be objected that the immunity enjoyed by them was owing to their contact with the sick being a momentary one. But Dr. Cabiadis remarks that if this be true with respect to the physician, it cannot be so with regard to the surgeon and assistant, whose duties obliged them to prolong their stay near the patients for the purpose of opening abscesses, washing and dressing sores, &c. The exception alluded to above was that of an assistant who actually died of the plague. But in an epidemic outbreak affecting a whole population, one death amongst an entire corporation would rather indicate the law that governed the general mortality at the time then the exceptional liability of that body for coming into contact with the diseased. Dr. Cabiadis says that he considers the atmosphere which surrounds a person affected with plague as the true medium of transmission. Apart from this, he has also met numerous instances in which he believes the clothes and bedding of plague patients communicated the malady to sound persons living beyond the sphere of the epidemic outbreak. Such articles were made of wool, cotton, flax, or hemp. He ignores whether these materials in a raw state would have given the disease as well, since he has not met with any fact to enlighten him upon the subject. The origin of plague and the causes that bring it into activity are utterly unknown. Some persons have conceived the idea that a marsh-miasm might be the exciting cause of this pestilence; but Dr. Cabiadis refutes this idea by quoting the immunity from plague enjoyed by Bussorah and Kerbela, two of the dampest cities in Mesopotamia, and both of them surrounded by marshes. Some persons have fancied that eating diseased camels' meat might have caused the outbreak in Mesopotamia. In order

to find out whether there were any truth in this assertion, Dr. Cabiadis made a careful inquiry, but failed to discover any evidence in corroboration of it. He, therefore, infers that diseased camels' meat, like that of any other diseased animal, might predispose to an attack of plague, but not engender the malady. The most palpable and evident of all the causes which predispose an individual to an attack of plague during an epidemic outbreak is poverty. No other malady shows the influence of this factor in so striking a degree; so much so, indeed, that Dr. Cabiadis styles the plague *miseria morbus*. In his experience, he found that the poor were seldom spared; the wealthy hardly ever attacked. Cholera also has a preference for the poor; but, at the same time it spares not the rich; whereas plague attacks exclusively the poor. The most effectual means for the protection of a community against the propagation of plague are—the isolation of the sick; the destruction by fire of their clothes; and the white-washing with lime and free ventilating of the domiciles in which cases of plague occur. The plague reappeared in only one, out of 350 houses which had been whitewashed after an outbreak of plague in them; whilst its reappearance in houses that had merely been abandoned for a time, after an attack of that disease, but which had not been whitewashed, was of frequent occurrence. The other disinfectants tried, such as sulphur-fumigations, lighting fires, and throwing a solution of sulphate of iron into the drains, gave no decided results, except when associated with the whitewashing and airing of the infected house. Dr. Cabiadis believes that *cordons sanitaires*, properly enforced, are extremely useful in checking the extension of an outbreak of plague. The greatest vigilance, however, is required to render them efficient, because the persons put to guard these cordons often allow passengers to evade them, either through neglect of their duties, or through the persuasive influence of bribes. He strongly condemns, however, the practice adopted at one time in Bagdad of shutting up persons smitten with the plague in their houses, and placing guards round them to prevent communication with the rest of the population. The fear of this harsh and unreasonable measure caused the inhabitants to conceal the existence of the malady, and even to bury inside the house those who succumbed from it; thus deceiving the authorities, and helping to intensify and propagate the evil it was intended to mitigate. Dr. Cabiadis can offer no sugggestions worthy of trust as to the best mode of treating plague. The remedies chiefly tried at Bagdad and Hilleh were:—Leeches and mercurial frictions to the swellings, combined with the internal administration of phenic acid or sulphate of quinine. In some cases these remedies were thought to do good, while in others they proved useless, if not detrimental; and Dr. Cabiadis is convinced that we know as little about the cure of this disease as we do about its essence. He concludes his interesting notes on this subject by expressing astonishment and regret that no public hospital exists in Bagdad, an extensive city of 150,000 inhabitants. A large military hospital was built there by Midhat Pacha on a fine and a healthy site, but no use has been made of it. He therefore suggests that the Government should turn it into a civil hospital for the benefit of the people of Bagdad.

Sir Joseph Fayrer, M.D., remarked that, while he approved of every sanitary precaution being taken, he hoped that one effect of the paper which had just been read would be to dissipate the irrational fear of contagion which existed in many quarters, and to disperse the panics which sometimes occurred in regard to the plague. He coincided with a high authority in Egypt who once told him that he had no confidence whatever in the idea that plague was extended by contact, and that *cordons sanitaires* were perfectly useless. He did not think that any amount of dirt or insanitation would ever generate the disease; but he believed that dirt and insanitation might encourage, foster, and intensify its development. He regarded the plague as being a low form of fever, something akin to typhus.

Dr. Caddy, R.N., had no doubt that there was a general desire among Orientalists to disguise the actual facts of the case. He could easily fancy that Oriental dirt and Oriental clothing constituted fertile sources of spreading the disease, which was said to be one that arose from poverty, privation, and filth, and which allied itself with acute febrile illness.

Dr. Lawrence Hamilton remarked that lying in these matters had been reduced in Russia to a scientific system. Omission and suppression of facts was carried on in that country to an extent which was almost inconceivable to the mind of an honest Briton. He looked upon the plague as a description of low typhus fever, which only manifested itself when a country had been devastated, scourged, and weakened by previous diseases.

Mr. Radcliffe observed that they must wait until the plague came within reach of some of the larger towns where hospitals could be established, with proper staffs attached to them, before attempting to approach the disease from a pathological point of view. Still, they had extremely valuable information on the subject; and the results of experience supported the conclusion of the Commission of the French Academy that there was no evidence to show that the plague was the result of direct contact with the sick patient,—the idea on which our quarantine laws were based; but that it was the result of an infection in the air and in the surroundings of the patient. There was, likewise, a concurrence of testimony in regard to the fact that a prime condition in connection with outbreaks of plague had been the poverty of the people who were attacked, and the misery and wretchedness in which they lived. So far as we are concerned, he believed that the ordinary administration of public health in this country—our ordinary arrangements—were adequate for our protection, and quite sufficient to enable us to deal effectively, thoroughly, and completely with any cases of plague which might be introduced into England. Even if a few cases did occur they could be encountered without any serious danger of extension, except under conditions of neglect and panic so scandalous that he declined to entertain a thought of them. We had been able so to cope with typhus that, save under circumstances of very exceptional destitution, we need not now look forward to an epidemic of that disease; and what was true in regard to typhus ought to be true with respect to the plague. If the Government were to act in the spirit which his remarks indicated, and were not to interfere with any nonsense about quarantine, cases of plague in this country would be simply pathological curiosities.

The Chairman remarked that a knowledge of the fact that Government were aware of the danger, and were prepared against any attack, could not fail to engender that confidence which was the best possible antidote to the panic which a severe epidemic was so likely to produce.

Votes of thanks were accorded to the authors of the papers for their contributions.

## SURGICAL SOCIETY OF IRELAND.

Session 1878-79.

Friday, February 14th, 1879.

The Sixth Meeting of the Session was held in the Albert Hall of the Royal College of Surgeons,

Dr. Edward D. Mapother, Vice-President of the College, in the Chair.

Mr. Richardson, (hon. sec.), read the minutes of the previous meeting, which were signed.

Mr. B. Wills Richardson made a communication on

EXCISION OF THE ELBOW JOINT—RECENT SPECIMEN.

which will be found at page 180.

Mr. CORLEY read a communication on

ABDOMINAL SECTION FOR INTUSSUSCEPTION

which will be found at page 180.

Dr. KIDD—Dr. Corley has mentioned my name in connection with this case. I was indebted to his kindness for seeing it in the first instance; and I was fortunate enough to establish a diagnosis. As the part I took was chiefly in regard to the diagnosis, perhaps before members address themselves to the question of the operation, I may be allowed to say a word or two as to the diagnosis. I believe it is only the second instance in my life in which I recognised a case of intussusception. Whether I may have overlooked cases before or not, I cannot say. The first case was not proved to be one of correct diagnosis, neither by the operation nor by the post-mortem examination. But I am quite as well satisfied in my own mind that the diagnosis was correct, as I am in this case, in which the correctness of the diagnosis was proved. The first case was that of a child, aged 5 months, of a lady residing at Killiney; it was a beautiful, well-nourished, thriving child. In the middle of the day the lady was nursing her infant, and having handed it back to the nurse, she noticed that it became pale, fainted, and afterwards appeared in pain. After trying the usual domestic remedies, she at once got into the train, came to Dublin, and brought the child to me; within, I believe, four hours of the time it first appeared to be ill. It was lying in the nurse's lap, exceedingly pale, and very weak; it had vomited two or three times, and passed a small, feculent motion from the rectum. It made constant straining attempts to pass more from the bowel; but on each occasion blood exuded. When I saw the blood it was quite red and fresh, but mixed with a small quantity of mucus. It has long been an established rule with me, if I see a patient suffering much, and find them passing red blood from the bowel, that I examine the rectum. We all know if blood issues down from the upper portion of the intestinal tract, it is altered in its appearance. If it is bright and red, we may be pretty sure it comes from the lower portion of the canal. I, therefore, examined the rectum, passed my finger in, and at once found a peculiar, sausage-like or conical roll, formed of the intussuscepted intestine; I thought I could even recognise the opening of the ilio-cæcal valve. It was somewhat pear-shaped, like the small end of a pear, a little curved, as it were, turned to one side; which, I thought, was probably the result of the attachment of the mesentery to it. But the feeling of it was so characteristic, I at once pronounced my opinion that it was a case of intussusception. I think the rule of always examining the bowel, either in a child or adult, where you have red blood from it, with any degree of constitutional irritation, would save us from a great many oversights, as I am sure it did me in that instance. Mr. Porter, Dr. Cruise, and others, saw the child with me; and we all agreed that it was a case of intussusception. The features of the case were—the sudden collapse, sickness, scanty feculent evacuation, straining efforts, and exuding of blood mixed with mucus; and then on passing the finger into the rectum we found the intestine. That was before Hutchinson's paper was published. We treated the child with opium, and made many attempts to return the intestine; but all failed, and the child died after some seven days. The next case, which Mr. Corley has detailed, was under similar conditions; the child in perfect health, the sudden collapse, sickness of stomach, a quantity of feculent discharge from the rectum, and then straining and exuding blood. When I saw it, there was fresh blood coming from the lower portion of the bowel. I passed my finger in, and found the coil of intestine. In the first case, I believe I saw the child within four hours of the time the invagination or intussusception took place; in the second, I believe it was about twenty hours from the commencement of the symptoms; and the intussuscepted portion of the intestine was as easily felt in the case I examined after the expiration of four hours, as in that I examined after twenty hours. So I believe that the process is one that takes place rapidly, passing down quickly into the rectum. As to the question of the operation, whatever responsibility attaches to it, I fully share with Mr. Corley. We were quite in accord in recommending the operation as the only chance the child had of being saved. Perhaps in the face of the statistics adduced by Dr. Brinton, it is rather hazardous to make this assertion. Of 42 or 43 per cent. of cases of acute obstruction by intussusception, he states that some 30 per cent. or more recovered. That is a very startling statement. But if it be true that Dr. Brinton's diagnosis of cases of intussusception was formed on seeing an escape of a portion of the intestine, we need not be startled. His diagnosis was, that if a patient evacuated a portion of the intestine after a certain number of days, it was a case of intussusception; and a large number of those patients recovered. I believe the escape of a portion of the intestine in adults is not by any means so uncommon as in children. In children the disease runs a much more rapid course. There are very few instances on record of the escape of the intestine in children. In the appendix to Jonathan Hutchinson's first paper, he has given a large number of cases, in all of which the diagnosis was established by evacuation of the intestine; and so the number of recoveries was very much less than Dr. Brinton records. In very few, where the patients were children, did the intestine slough off, and the child recover, though there are some few cases of it. Dr. Hutchinson remarks that all those cases may be fairly divided, as cases of hernia are, into two classes—cases of intussusception where the intestine is strangulated, and cases of intussusception where it is simply irreducible. Where it is strangulated it shows the collapse is extreme, and as a rule, death results; but where it is simply irreducible, symptoms of collapse are not so great, and straining and vomiting not so severe, and if the child survives the condition, the prospect of the intestine sloughing off is less than if it was strangulated. That you can easily understand. It has been suggested that the hæmorrhage which occurs in those cases should be taken as a proof of strangulation. That has been found to be an error. Hæmorrhage is not a test of strangulation, but rather that the tumour is not strangulated. Intussusception strangulates the veins of the part; the artery resists the pressure; the arteries go pumping the blood into the intussuscepted portion; the vessels give way, and hence we have the hæmorrhage occurring. So it is rather a proof that it is not strangulated. In very few cases in which post-mortem examinations have been made, has there been any peritonitis found. That is one of the most important features, perhaps, in connection with it. The cases of strangulated intussusception are, of themselves, very rare. The majority are of the other class—the irreducible. Where you have the irreducible form, peritonitis is not set up until the very last stage, if even then. It has been made an objection to the operation, that an early effect of the intussusception would be to set up peritonitis and adhesions; but if you examine the records of the cases in Mr. Hutchinson's tables, where the state of the bowels, either on operation or at the post-mortem examination, is fully detailed, you will see his remark is entirely confirmed, that peritonitis and adhesions are very rarely found indeed. I think that is a very important point in favour of the operation. In some of our class-books it is made an objection that the parts are adhering; and in attempting to draw the invaginated portion out, you require to tear the adhesions, and set up hæmorrhage and fresh inflammation, which may be sure to be fatal. However, the points that I have tried to put in reference to this operation, are that in the majority of cases sloughing does not occur, and yet there will be fatal results; and that in the majority of cases adhesions do not occur, notwithstanding the closeness of the restriction; and that in the large majority of cases all other attempts except the operation fail. Hence, I do not see how we can hesitate to operate. It seems to me to be a case similar to that Spencer Wells records in "The History of Ovariotomy:" When an eminent surgeon asked him "how could he dare to open that woman's peritoneum?" his reply was "how could he dare to stand by and let that woman die unaided?" It comes to this, therefore, that if we have a case of intussusception in a healthy infant, and death is inevitable, I do not think that a surgeon with the present knowledge of abdominal surgery, would dare to stand by and see the child die unaided.

Mr. STOKES.—As I was present at the operation that has been so well described by Dr. Corley, I may be permitted to make one or two remarks. Dr. Corley has mentioned the opinions of two very eminent English surgeons, Mr. Jonathan Hutchinson, and Mr. Teale, of Leeds. Both are diametrically opposed to one another, one holding that we are not in our present state of knowledge justified in performing this very serious operation unless we are satisfied that we can make an accurate diagnosis as to the cause of the obstruction; the other, Mr. Teale, being of opinion, as we have just heard, that owing to the introduction of improved methods of operation, we may undertake it in cases even where we cannot form an accurate diagnosis. I think that, though my experience may be very limited in this operation, we can hardly accept

either of these views. I think that we are perfectly justified in performing the operation even when we cannot make an accurate diagnosis; and I maintain that in most of those cases it is, in our present state of knowledge, wholly impossible to make an accurate diagnosis as to what the exact nature of the obstruction may be. In the case of that rare form of intussusception, or that ilio-cæcal form, which Dr. Corley treated, it is quite clear that no other method of treatment could possibly have been of any avail but that adopted, for, as Jonathan Hutchinson has well pointed out, there is no record of any similar case having been cured by Nature. By no method of abdominal or rectum taxis, or medical treatment, could reduction have possibly been effected; and therefore, though the case has terminated fatally, there is nothing to regret—but quite the reverse—in the operation having been undertaken and performed. My experience of abdominal section is limited to two cases I have operated on, and in both of these I am sorry to say the result was unsuccessful. In one of those cases the diagnosis could be made distinctly; in the other it could not. The first was that of a patient in the Richmond Hospital admitted with symptoms of strangulated hernia, and he had strangulated hernia. In the absence of any of the surgeons, one of the pupils, with more zeal perhaps than discretion, proceeded to reduce the hernia, and the symptoms not having been thereby ameliorated or improved, I was sent for, and found the patient still suffering with all the symptoms of strangulated hernia. A consultation was called, and we all agreed that what probably had taken place was that the hernia had been reduced *en masse*, and that the obstruction still existed in the abdomen. I accordingly performed laparotomy, and discovered the obstruction and succeeded in reducing it; but, as I said, the result of the case was not favourable. In the second case the diagnosis could not be satisfactorily made. It was the case of a gentleman, æt. 55, on whom I operated last autumn. He had some time previously been suffering from habitual constipation. Having been under the care of Dr. Gordon and Dr. Speedy, I need hardly say that everything that medical skill could do for him was done. Finally, no amelioration in his symptoms taking place, I had had an opportunity of seeing him, and I agreed with Dr. Gordon that the only chance for the patient was to perform abdominal section. No tumour could be distinctly felt, nothing could be felt by the rectum, but he had all the symptoms of abdominal obstruction. Before operating I had the advantage of a consultation with Dr. Robert McDonnell and Dr. Thornley Stoker; and I made frequent careful examinations of the case. Among other plans, we adopted passing our hands into the rectum. Dr. Stoker and I endeavoured to pass the hand and arm up into the colon. I was able to do so, but could not get farther than about two inches beyond my wrist, and yet I could not feel any distinct tumour, or determine from the examination what was the cause of the obstruction. I think the result of his examination also was very similar to mine. I performed colotomy. It gave some immediate relief as far as the evacuation of the bowels was concerned, but the patient after twelve hours died from apparent exhaustion. This was a case in which no apparent diagnosis could be made; and I regret that no post-mortem examination would be allowed, so that I cannot really say what was the cause of the obstruction. There was another case in which I operated, and I regret I did not perform laparotomy. It was a case of hernia under my care many years ago in the Richmond Hospital, whilst my late colleagues, Professors Smith and Adams, were there. The man came in with symptoms of strangulated hernia, and on examining the left groin I found a small tumour there, but there were none of the local signs of tumour about it. We were not satisfied that this was a hernia tumour at all, and we considered it desirable to make an exploratory operation, which I did, and found it was a piece of omentum. This was reduced, the symptoms of strangulation continued, and the man died. I found there was a mechanical obstruction in the abdomen caused by a cord-like fibrous band crossing the intestine. There was a dilated portion of gut on one side, and a thin, attenuated portion on the other. Had laparotomy been performed, it is quite possible the obstruction might have been removed, and the patient's life saved. I cannot endorse what Mr. Teale has said, for we cannot look upon it in any light to be as trivial an operation as he would make it, while he institutes a comparison between laparotomy and ovariotomy. The condition in both is totally different. In one case you have more or less diseased intestine; and in the other, the intestines are not necessarily affected at all. It is true, the peritoneum is, in both cases laid open, but in the one you very often have acute inflammation present, and in the other acute disease of the intestines. Therefore they are totally different, and the two should not be in any degree contrasted one with the other. Although antiseptics have done much to render the peritoneum more easily dealt with and handled, and operated on than before, they will never diminish the enormous risks of the operation of laparotomy or abdominal section. Therefore, I think it should only be undertaken after mature and grave consideration, and after everything was done that could possibly give a chance of the patient's life. I shall only say in reference to the very ingenious theory put forward as to the mechanism of this peculiar form, that in my opinion it bears all the evidence of extreme probability as to the way in which it occurs.

Dr. HENRY KENNEDY was struck with the number of infants in whom, on post-mortem examination, he found intussusception. There was nothing more common than to find, not one, but several intussusceptions in the same child. Intussusception did not, however, exist to the same extent, nor was it probably the formidable disease Dr. Corley had brought forward, but it was intussusception to all intents and purposes—½ inch to 1½ inch—and four or five occurred in the same child. There was a peculiar tendency in children to the disease. He concurred in Dr. Corley's description of it. Six or seven cases of intussusception that he had seen would have been fair cases for operation, there having been in each the sudden collapse of a healthy child, from vomiting, and above all, the appearance of blood. None of the cases survived the disease a third day from the moment of attack, exhibiting symptoms exactly as Dr. Kidd described. He regretted that in bygone years he had not had the same knowledge of treating the disease as at present, for he thought that no medical man, whether physician or surgeon, would be justified in passing over a case of the kind without giving the patient a chance by an operation.

Mr. BENNETT observed that he had recently brought before the Pathological Society the record of a case bearing on the question of diagnosis. The facts were these: A young man, æt. 25, a painter, who previously suffered occasionally from colic, was, nine days before his admission to hospital, seized with intense pain in the abdomen, a pain on the right side of the mesial line below the umbilicus; and from that moment, vomiting and obstruction followed. He had no motion from the bowels for many days before his admission. Having been seen first by a practitioner in town, and subsequently by Mr. Porter, the latter admitted him to hospital, where he was received late in the evening. His condition of depression was such that he was reported to be dying. When I was asked to see him it was stated that he was *in articulo*. His condition was not very much removed from the description given; but still the man had suffered somewhat from the collapse of moving in a cab. He was a thin and spare man, and of small-sized limbs; but his whole abdomen was distended to such a degree that if a pin were pricked against it it would burst. There was a coil of intestine passing along in a way that he could hardly hesitate to think the colon was distended, and I said at once the obstruction was somewhere near it. I passed my finger into the rectum without any result at first; but with a little more exertion I found, as the patient strained, both the sphincter and the anus, and all the muscles of the abdomen within reach of my finger, a body which had all the characteristics of intussusception so-called—a sausage-shaped tumour depression in the extremity, divided to the side, but it presented from the right side and downwards to the level of the hip on the left side. Thinking it was an intussusception high up, not turning towards the back, I attempted to pass a catheter into it to verify my conjecture. Failing this I used a polypus forceps. I caught hold of it lightly, and was then able to determine the fact that it was outside the rectum, as I felt it through the wall of the rectum. I then made up my mind that it was a case of intussusception high up. The condition of the man was such that no surgeon would operate on him at the time, and I determined to leave the case over till morning, treating the collapse as well as possible. The man's breathing was so embarrassed that he would fail to breathe much longer with the pressure of the diaphragm; and with the finest aspirator needle I penetrated the colon, as I thought, and for twenty minutes or more I had to stand by whilst a stream of gas escaped from its opening. There was great relief, and the man said, after five or ten minutes, if he were let be quiet he would go to sleep. Opium was administered and the needle

withdrawn as soon as the air ceased to flow; and I waited till morning, with the intention then to explore by direct incision into the abdomen, if the man's condition were suitable. The patient was dead in the morning. The post-mortem examination revealed the fact that the tumour was not intussusception. There was a stricture of exceptional character, which destroyed the entire cæcum, and the pressure caused thereby, combined with the pressure of the small intestine, produced the obstruction. In making the post-mortem examination I evacuated a quantity of free gas through the cavity of the abdomen. There was peritonitis older than the date of the puncture with the needle, to which therefore it could not be attributed. Had either colon outside the peritoneum been opened I should have failed, and the obstruction could not be reached except by a direct incision into the abdomen. This pointed to the fact, passed over by the previous speakers, except by Mr. Stokes, that the diagnosis was of extreme difficulty. Whatever the facility of diagnosis in a child under the conditions mentioned by Dr. Corley and Dr. Kidd, I do not think they were very forward in diagnosing the nature of the obstruction in the adult. My experience would incline me to be cautious as to operating hastily. I had details of three cases in which complete obstruction in the adult existed, and with as great distention as in the case mentioned, though the patients had not sunk so low, and after 15 days in one case, and 11 in another, the patients recovered without any operation. While I was perfectly willing to open the abdomen as an extreme measure, I should be slow to adopt the operation hastily.

Mr. CORLEY replied. A good many points had been mentioned, especially by Dr. Kidd, showing that the subject was an extremely large one. He thought Dr. Kidd would have related his experience in another case bearing on the opinion quoted from Hutchinson and Teale. Anyone misunderstood him who thought he had represented Hutchinson as objecting to the operation. What Hutchinson warned surgeons against was an exploring operation when the diagnosis was not certain. The case he expected Dr. Kidd would have mentioned was that of an operation performed by Staff-Surgeon Johnston for obstruction, the precise nature of which was not known. There was no obstruction found. The cæcum was opened and an artificial anus established, which was afterwards cured, and the woman recovered and lived a couple of years afterwards. What Dr. Kennedy stated was a well-known pathological fact as to the discoveries by post-mortem examinations in intussusception, and these conditions were, he believed, especially frequent in cases of hydrocephalus. At the close of his observations Mr. Bennett had said he was cautious in recommending an early operation. He did not wish anyone to think that he (Mr. Corley) would perform the operation heedlessly or without a full sense of responsibility. The truth very fairly lay between Teale and Hutchinson on the subject. When the patients were stupefied with opium, stercoraceous matter may be drawn into the lungs, giving rise to a form of pneumonia, which was an additional element of danger. This was a fact which was new to him.

The Society then adjourned.

THE rates of mortality in the principal foreign cities, according to the most recent weekly returns were in Calcutta 42, Bombay 30; Paris 26; Geneva 20; Brussels 32; Amsterdam 29; Rotterdam 33; The Hague 27; Copenhagen 26; Stockholm 25; Christiania 15; St. Petersburgh 48; Berlin 25, Hamburg 27, Dresden 22, Breslau 28, Munich 31; Vienna 32, Buda-Pesth 41; Rome 27, Turin 29, Venice 26; Alexandria 45; New York 27, Brooklyn 23, Philadelphia 23, and Baltimore 23 per 1,000 of the various populations. Small-pox caused 47 deaths in St. Petersburgh and 18 in Buda-Pesth.

AT the last examination of candidates for the Licence of the Royal College of Physicians, London, there were twenty-four candidates, all of whom passed. Such a fact has, we believe, never before occurred in the annals of the College, and each member of the batch is to be congratulated upon his part in so happy a consummation.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, MARCH 5, 1879.

## THE PLAGUE.—III.

IT must not be supposed that the adoption by our Government of preventive measures against the plague is unnecessary, because it is doubtful whether the pestilence, which has already been apparently stamped out of Astrachan, will gain a footing in this country, or because the comparative cleanliness and sanitary condition of our countrymen and their homes, would prevent any serious mortality arising from a few cases being accidentally imported. If, as many contend, and we, for the most part admit, dirt, poverty and overcrowding favour the extension of the disease, there are still hundreds of dirty districts, and thousands of dirty people, in our large towns, that would form a favourable nidus for its development were it once to appear amongst us; and as regards poverty, the Earl of Carnarvon has just reminded the Government that there is at this moment an amount of distress, poverty, and want of food, which is greater than has been known for a long period. Before, however, we briefly detail the measures that should be taken to prevent the propagation of this disease, it will be advisable to mention categorically the chief facts which are known respecting its nature, and to say whether the recent outbreak of pestilence in Astrachan is in every respect identical with the plagues which have in former times visited Europe.

With regard to the nature of plague it may be summarily stated that it is a contagious disease generally prevailing as an epidemic, but sometimes sporadic; that it presents most of the characters of a malignant or putro-adynamic fever, accompanied by certain symptoms of a specific nature; that there is great prostration of the

powers of life, and a great tendency to a dissolution of the crasis of the blood and of the soft solids, the mucous membranes, the cellular tissue, and the capillaries, early manifesting the effects of these changes ; that it is often attended with hæmorrhage from some mucous membrane, generally epistaxis or hæmoptysis, still more frequently with buboes and carbuncles in various parts of the body, and sometimes with petechiæ, vibices, and livid patches ; that in many instances owing to the annihilating effects of the contagion upon the vital powers, the patient is rapidly carried off, without any vascular reaction taking place, without the development of any buboes or any other local symptoms, and without either the gastric or cerebral organs being prominently affected ; that, therefore, although the pestilence has been specifically the same in all ages, and in all countries, there have always been different grades or forms of the disease, the local symptoms, the nervous symptoms, or the gastro-enteric symptoms, being more prominent in some cases and in some epidemics than in others ; that although there are many reasons for believing that it may be generated *de novo*, it is, generally speaking, preserved and spread, and appears epidemically, in virtue of its eminently contagious properties ; that the chief pre-disposing causes of the disease are want of cleanliness, insufficient food, overcrowding and bad ventilation, a moist condition of the air, and a temperature ranging between 35° F. and 75° or 80° F.; and that it is most surely contracted by persons who are exposed to the atmosphere surrounding infected persons, or who come much in contact with them, or with their bedding, clothing, and other infected articles. Such are the most prominent characteristics of the plague, and the question is whether the pestilence which has recently appeared in the Levant, and extended to Russia, is the same disease as that we have been describing.

There can be no doubt that the extraordinary precautions which have been taken by the German and Russian Governments were taken from a conviction that they had to contend with the same bubonic pestilence which had in former times depopulated so many cities in Europe. The descriptions that have been given by eye-witnesses of the Levantine Plague as it occurred in 1877 and 1878 (and some of which will be found in Mr. Netter Radcliffe's 'Official Memoranda') leave little doubt as to the nature of the disease. In the description given by Surgeon-Major Colvill of the plague which occurred in the Province of Bagdad in 1876-77, we have several characteristic features of the pestilence. The symptoms are ushered in by that same dread of approaching evil to which we have already referred. The patient "becomes distracted, tosses about in evident fear of something he cannot describe, and if he is absent from his house runs home like a maniac and throws himself on his bed." There is fever of twenty-four to thirty hours' duration. There is that dull apathetic condition of the patient so often observed in this disease. "He has to be spoken to two or three times before he can understand the questions," or his head "will roll from side to side and his face becomes flushed like that of a drunken man." The tongue is black : the teeth and gums are covered with sordes ; the thirst is unquenchable ; the pain in the epigastrium such as if this region were "full of burning charcoal." That there is vomiting, perhaps of blood, and then that enlargement of the lymphatic glands (buboes), and those carbuncles and petechial spots, which have attracted the attention of all who have had personal experience of the disease. The rapid and fatal progress of the pestilence was also well marked in the epidemic to which we are now referring. "I have known cases," says Surgeon-Major Colvill, "in which the patient apparently in good health has screamed out that he has been stabbed in the groin. In these cases the glands enlarged before the fever set in, and they were quickly fatal." Out of 534 deaths 311 occurred within the first three days, and 126 within the first twenty-four hours. The accounts of the plague in Pesht given respectively by Dr. Castaldi, Ottoman Delegate, by Mirza Mehmet Hassan Khan, and by Dr. Konsyimsky, Physician to the Russian Legation, Teheran, closely correspond with that given of the plague in Bagdad by Surgeon-Major Colvill ; and they all agree in regarding the disease as the true bubonic or Eastern plague. Dr. Castaldi gives the following very graphic description of the physiognomy of the disease : "Ce qui caractérise d'une manière non équivoque la peste . . . c'est une expression particulière de la physionomie des malades qui ne peut pas être confondu avec celles des typhiques, ni des cholériques, et qu'il suffit d'avoir vu une seule fois pour ne plus l'oublier. Les yeux sont retirés dans les orbites, mais ils ne sont pas cerclés, d'azur comme les yeux des cholériques, le regard est hagard, mais il n'a pas la fixité de celui, des typhiques, les muscles de la face participent du relâchement des autres muscles et ne présentent pas les rides et les contractions des muscles des malades atteints de typhus ou des maladies cérébrales. L'expression de la figure des pestiférés est celle de l'apathie. Bref, la paste, a une physionomie particulière et la démarche chancelante des pestiférés imprime à l'ensemble de leur attitude un cachet caractéristique." Dr. Castaldi concludes by saying that the symptoms, the progress, and the special physiognomy of the disease do not leave on his mind a shadow of doubt as to the epidemic he witnessed being the true plague. The other observers bear similar testimony ; while in illustration of its fatal and contagiousness Mehmet Hassan Khan mentions one family, seven members of which were carried off in eight days. The German Sanitary Commission was therefore justified in saying that the Russian authorities had "to deal with an outbreak, very limited in extent but intense in character, of the plague, and indeed of the so-called Indian or Asiatic plague."

Now, with respect to the prevention of this pestilence we shall confine our remarks to a few points about which there appears to be some difference of opinion, namely, the question of contagion, the question of quarantine and the influence of filth upon the propagation of the disease. Formerly, there were not wanting people who did not believe in the contagiousness of the plague. This is not the opinion held at the present day, but according to a paper recently read by Mr. J. Netten Radcliffe before the Epidemiological Society, Dr. Cabriadis concluded from his experience of the plague at Bagdad, that no great risk was incurred in touching persons

affected with the plague, provided a person avoided exposing himself for any lengthened period to the atmosphere of the apartment occupied by the patient. If this is the case it would follow that the plague is not nearly so contagious as some of our own infectious diseases, such as scarlet fever or small-pox, and that the stamping out of a pestilence that can only be contracted by actually living with the infected, ought not to be a matter of much difficulty. Unfortunately, however, the opinion of Dr. Cabiadis is opposed to that of all the most experienced writers on this disease, and of all those who witnessed the dreadful outbreak of the disease in Europe in the latter part of the last and in the beginning of the present century, and therefore it would be unsafe to act upon that opinion unless it were supported by further evidence. Dr. Bancroft, who was present with the English army in Egypt, while the plague was raging in that country, states "that the facts which prove the necessity of actual contact with some infected person or thing to communicate the disease are so numerous and notorious that it is unnecessary for me to enter upon a detail of them, after what Dr. Russell and others have published . . . it was shown that all those who avoided contact invariably escaped the disease, while those who did otherwise in suitable conditions were very generally infected . . . nor was there, so far as I have been able to discover, any instance in the French-Egyptian army of a communication of the disease without contact." Similar views were held by Sir James M'Grigor, and many able observers, who had the opportunity of witnessing far more terrible epidemics of this disease than have fallen to the lot of Dr. Cabiadis. While this physician contends that the atmosphere about the sick is "the true medium of transmission," he believes —and who does not believe?—that the clothes and bedding of the sick may transmit the disease. But how can a person come into contact with a plague-stricken patient without coming into contact with his clothes or bedding? or without breathing the air which surrounds him? The fact is, this attempt to revive the old distinction between the terms "contagion" and "infection," is neither scientific nor politic. In all infectious diseases it is difficult to say how much the infection is due to actual contact, and how much to being exposed to the atmosphere of the sick room, as exposure to one medium of infection generally introduces exposure to the other. Dr. Cabiadis contends that the plague is very infectious and not contagious, and only very infectious when there is constant communication between the healthy and the sick. But he admits the clothes may, apart from the patient, transmit the disease, that is to say, a person may become infected without coming into communication with the patient, and without breathing the same air! Hence, this physician's opinion is not only at variance with that of most writers on the subject, but may be regarded as rather paradoxical. The fact is, for all practical purposes it is sufficient to know that plague is a contagious disease in the modern sense of that term, and that either the atmosphere about the sick, or his clothing, and other fomites, may be the media of its transmission. Hence it follows that *isolation* and *disinfection* are the two great measures that should be depended upon for its prevention. It is these principles which have guided the Russian Government in its dealings with the plague in Astrachan, which should guide the action of our Government should the disease threaten to visit this country, and on which the propriety of some form of *quarantine* can alone be defended. In other words, quarantine is only advisable in so far as it enables sanitary authorities to thoroughly carry out the system of isolation and disinfection. Of course, the old plan of keeping passengers on board a ship for thirty or forty days, because they have come from a plague-stricken port, is out of the question at the present day, when, in most places, the sick can be successfully isolated, and everything in the ship disinfected, under what is now called the "system of medical inspection," which involves a detention of only two or three days, or even less. In the case, however, of such a terrible pestilence as plague, a quarantine of observation of five to ten entire days, either in a lazaret on shore, or on board of a troop-lazaret, might, in some instances, be deemed necessary. This plan has been resolved upon by the French Government with respect to the Mediterranean Ports; while, as regards their Channel Ports, they have ordered a quarantine of three to five days either on board, or in a hospital; the disinfection of wearing apparel, and of the vessel itself being also obligatory. But we should hesitate before saying, as some have done, that quarantine should be wholly given up, as other precautionary measures cannot be taken without some form of quarantine being practised. It may, indeed, be said that "isolation" is nothing more than a species of quarantine, whether in respect of a single individual, or of a whole district. Some sanitarians, as for instance, the International Sanitary Conference which met a few years ago at Vienna to consider what precautions should be taken against cholera, think that quarantine by land is useless and impracticable, but that it should be adopted by sea. The members of the conference were unanimous in recommending that quarantine, especially in the Red and Caspian Seas, should be carried out in as complete and satisfactory a manner as possible. But with regard to plague, it appears that even Dr. Cabiadis is not opposed to inland quarantine, for "he believes that *cordons sanitaires* properly enforced, are extremely useful in checking the extension of an outbreak of that pestilence." At all events, the Russian authorities have been pretty successful in stamping out the plague in Astrachan. We doubt whether they would have been so successful if they had been guided in their action by the doctrines of those who do not regard plague as a contagious disease, and who talk of the "nonsense of quarantine." We are not surprised, therefore, that the Duke of Richmond and Gordon, and the Earl of Carnarvon, questioned the propriety of the remarks made by some of the members of the Epidemiological Society, and that the former resolved, "to do all in his power to see that quarantine is effectually carried out." The temperate adoption of quarantine will be the best means of keeping the plague from this country, while strict isolation and disinfection are the only means of preventing its extension should it ever gain a footing. We have, therefore, little to fear from the disease, provided our sanitary authorities and the public likewise, take these precautions against it.

# Notes on Current Topics.

## Changes in the Irish Local Government Department.

A SERIES of departmental changes, which are of extreme importance to Poor-law medical officers in Ireland, are either accomplished or pending within the Local Government Board for Ireland. Mr. O'Brien, a most popular and efficient Inspector in the service, and one whose severance from it is felt to be a loss, has been transferred to office under the new Prisons Board. His place in the metropolitan district will be taken by Dr. MacCabe, the Inspector now in charge of the Cork district, and the profession feel that no more judicious selection could have been made. As a dispensary medical officer for some years, Dr. MacCabe has known what it is to follow the plough—as Resident Physician at the Waterford District and Dundrum Central Criminal Asylums, he acquired a valuable administrative experience, and since he entered the service of the Local Government Board he has won the confidence of both his masters and those with whom he had to deal.

Dr. Brodie, the inspector for Galway, leaves that district to replace Dr. MacCabe at Cork, taking with him the best wishes of those with whom he had worked there for so many years. His successor is Mr. Power, son and ex-Secretary of Sir Alfred, the well-known head of the Local Government Department in Ireland.

The most interesting change in office is that which has been rumoured for a long time, but which is now considered likely to be realised, to wit, the abdication of no less a potentate than Sir Alfred Power himself. The rumour has been so long in the public ear that we may not be considered presumptive or indiscreet in mentioning it. It is said that Sir Alfred has long been anxious about the future of his son, but—his mind being now set at ease on that score—proposes to retire to a well-deserved rest from his labours. But who is to follow him? The whispers oscillate between the Hon. David Plunket, M.P., and Mr. Henry Robinson, formerly himself an inspector under the Local Government Board, and now Assistant Under-Secretary at the Castle. The tide of opinion sets very decidedly in the latter direction.

Whether these rumours are or are not the shadows of coming realities, we cannot but feel an almost breathless interest in the change. The throne of the Local Government Board is, with respect be it said, of more direct interest to the people of Ireland than that of the Lord Chancellor, or even of an Archbishop. The efficiency of the sanitation and poor-law administration of every parish and every village in the country is, every day in the week, directly influenced by the Local Government Board, and while on the one hand an industrious, intelligent, and capable leader of the department would out-value a prince in its relation to Ireland, so on the other hand an indecisive, dull, or impracticable President of the Local Government would be a living calamity to the country.

## Killed in the Streets.

ONE of the most estimable and kindest-hearted members of our profession, Mr. John Oakeshott, of Highgate, was brutally knocked down and killed in the streets of London in the early part of last week. It appears from the evidence of an eye-witness, a passing cabman, that as Mr. Oakeshott was quietly standing on the shelter that occupies the middle of the roadway at the Strand end of the Northumberland Avenue, one of Taylor's ginger beer vans was seen to be driving at a furious pace towards him. The driver, it appears, was racing, and to avoid the other van drew his horses towards the spot where the unfortunate gentleman stood, and swerving a little, the pole caught him and threw him down under the horses' feet; in an instant the wheels of the van passed over him and fractured his skull in a most frightful manner. It is almost needless to point out that this is one of the most dangerous crossings in the whole of the metropolis, and certainly the Commissioner of Police would show his regard for the lives and limbs of Her Majesty's subjects by stationing one or two members of the force at this particular spot, for the purpose of protecting foot-passengers from the increasing danger of being knocked down and run over by the reckless class of drivers one constantly encounters about this much frequented thoroughfare. Mr. John Oakeshott, who has thus met with a sudden and cruel death, received his education at University College Hospital some fifty years ago, and the greater part of his life has been spent in Highgate. He was medical officer of health for Hornsey, and filled other posts of responsibility in the district. He was greatly and widely respected in Highgate by rich and poor, where his loss will be severely felt and deplored by a numerous circle of friends. It is some consolation, although a miserable one, to know that the driver of the van stands committed for trial on the charge of manslaughter.

## The Ladies and the College of Physicians.

As an illustration of the anxiety which characterises the female mind to gain an entrance to the hallowed portals of our medical colleges, we may mention that as soon as the announcements were made last week that medical practitioners would be admitted on presentation of their cards to the Goulstonian Lectures at the Royal College of Physicians of London, the ladies at once put in their claims. The very idea of a troop of petticoats being marshalled in like girls to a boarding school, was too much for the equanimity of the authorities of this venerable institution, and in order to avoid the possibility of such a contingency the announcements were at once altered to *gentlemen* being members of the profession, &c.

## Brown Bread v. White.

PROFESSOR A. H. CHURCH contributes an article in the current issue of *Nature* on the subject of the dietetic value of wheaten bread. In a former article, published some two months ago, Professor Church exposed the fallacy of supposing that brown bread possessed a *directly* higher nutritive value than the ordinary bread made from white flour. Though the latter contains actually less nutrient material than the former, still the ready digestibility of its flesh-formers, as contrasted with the indigestible nature of the excess of nitrogenous matter in the brown bread, makes it a preferable article of diet. The recent report of the committee appointed to inquire into the dietaries of

the prisons in England and Wales, serves Professor Church with a basis for his last communication on the subject, And the concluding paragraph of the article deserves especial notice. He writes: "The committee is clearly right when it urges the desirability of including most of the coarser mill products of wheat in the meal on account of the phosphates thus secured; and the proposed plan is a good one, of making the dough of the finer mill products only at first, and then introducing, when the dough is nearly ready for the oven, the middlings, sharps, and pollard, again kneading the mass as quickly as possible, and then baking it. The excessive solidity and stickiness of most wholemeal bread is thus avoided, since the ferments present in the seed coats of the grain have but little time to exert their action on the starch of the flour."

## Physical Competition in the Army.

THIS subject was brought before the House of Lords on Friday last. At first we were in favour of the proposal that was made by some of the authorities at the War Office, but now we would say that it is neither very practicable nor, on medical grounds, at all advisable. No doubt strength of muscle and agility of limb may be tested by such a physical competition as that which has been recommended, but this physical competition, while it might not, as Viscount Bury said, dovetail in with the intellectual competition now in force, certainly would not test that power of endurance, or that "staying" power which is the best evidence of a strong constitution, and which is of so much value to a soldier. Much as we would encourage the practice of all kinds of physical exercises, not only in the army but among all classes of the community, it should not be forgotten that they are rather a means of invigorating, than a means of testing, the constitution of an individual. A man may be able to run a mile in a fixed time, or jump an immense height, or "throw" one antagonist after another, and yet not have much power for long and sustained exertion, and for undergoing all kinds of fatigue and privation as men who have not half his muscular strength or bodily agility. Now this strength of constitution, and this power of endurance, not only could not be well tested by the proposed physical competition, but do actually in nine cases out of ten go hand in hand with that superior intellectual merit and power for mental work which characterises the successful candidate for an appointment in the army. Hence we are not surprised to hear, on the authority of the Duke of Cambridge, Viscount Bury, and Lord Cardwell, that the men who now enter the army are for the most part as remarkable for their physical, as they are for their intellectual, qualifications.

## Osteological Characteristics of the Andamans.

PROFESSOR HENRY FLOWER will deliver the first of nine lectures to-day (Wednesday), in continuation of the course delivered at the College of Surgeons of London last year, on "The Comparative Anatomy of Man." One of the most interesting portions of this course will be that devoted to a consideration of the osteological characteristics of the Andaman Islanders, and the relation these bear to other races. A series of crania and skeletons have lately been received, which will serve for the demonstration of these special features. Admission to the lectures will be accorded to all who wish to avail themselves of the opportunity they will afford, of following the history of ethnological details, and the demonstrations of them afforded by recent additions to the museum.

## The Plague.

THE latest news from Astrachan is still very favourable, but it appears that the countries bording upon Russia in Europe are not relaxing the rigid measures they have adopted with respect to their intercourse with that province. With regard to the action of the German authorities, Herr Thilenius expressed, at a meeting of the Reichstag held on the 1st inst., a hope that an International Plague Commission would be established, and further that a Council of Public Health would be formed in Germany to act in conjunction with the Sanitary Board. Herr Hofmann also addressed the House, and after giving an account of the recent progress of the plague, and of the measures taken by the Russian Government to stamp it out, stated that no case of sickness had occurred outside the sanitary cordon. He spoke in the strongest terms in favour of every possible precaution being taken to keep the pestilence away from the borders of Germany; and subsequently it was resolved that as regards Russian trade, quarantine and measures for disinfection should be put in force at 18 North Sea ports, and 30 Baltic ports. The German Government also intends to extend the prohibition of importation to bones, manure, and cordage material. No fresh case of plague has, up to the time of our going to press, occurred in the Government of Astrachan, or in the internal Kurgiz district.

## The Hunterian Oration.

IT is the custom of the Hunterian Society to select every year one of their members to deliver an address. The choice of a topic is left to the discretion of the orator. The address or oration (as it is officially termed) for 1879 was delivered on Wednesday, 12th of February, in the Theatre of the London Institution, by Mr. Rivington, F.R.C.S. The main topics of the oration, which was delivered without manuscript, and occupied 75 minutes, were the position of the medical profession in the body politic, and the means of raising it in public estimation. The defects of the preliminary, the scientific, and the professional branches of education and examination, the conflicting regulations of the 19 Licensing Corporations, the over-legislation which burdens students, teachers, and schools were discussed, objections to conjoint examinations were combatted, and an adequate representation of the rank and file of the profession in the General Medical Council, the Medical Corporations, and in Parliament, was advocated. The Orator spoke in favour of the requirements of Greek at the preliminary, of a preliminary scientific examination, the establishment of educational museums in the provinces, an examination at the end of each year of professional study, and the commencement of the professional curriculum in the summer, in order that medical students might learn osteology and ele-

mentary histology, before the commencement of dissection in October. State supervision of all institutions for the distribution of medical relief to the poor, the more accurate adjustment of general and special hospitals to the needs of the population and the requirements of medical education, the elevation and extension of the Poor-Law and Sanitary Medical Services for the purpose of supplying the sick poor with adequate and qualified medical aid, instead of leaving so much to the laws of supply and demand, which fostered empirics and counter-prescribing chemists, were upheld. Having made some stringent remarks upon the want of acquaintance of the public with matters medical, the hostility of the public, and the indifference of the powers that be to the profession as a body, as exemplified in the sorry treatment of medical men engaged in the public services, and the attitude assumed towards scientific research, the speaker concluded with inculcating the necessity for union within the ranks of the profession, and the subordination of individual action to the common good of the professional community. The address was very favourably received, and a vote of thanks to the Orator concluded the proceedings.

## The Registrarship of the London University

HAVING been conferred upon Mr. Milman, the Assistant Registrar, upon the resignation of Dr. Carpenter, the second post is now vacant, for which, probably, a large number of candidates will present themselves. As yet we have heard of but one candidate, Dr. Gillespie, Secretary to St. Thomas's Hospital, who is certainly in every way eligible. He has served under the Crown at home and abroad, in the Army Medical Department; has been superintendent of quarantine in Mauritius, district magistrate, commisioner in lunacy, chairman of Local Board of Health, &c. These offices Dr. Gillespie was compelled to resign, and return to England whilst suffering from blood-poisoning. Having recovered, he has since occupied the post of secretary to St. Thomas's Hospital with satisfaction to the authorities. Dr. Gillespie is yet barely middle-aged, is a good book-keeper, and with such a wide past experience to his credit, should stand a good chance of success, for which he has our best wishes.

## Frauds upon a Dublin Hospital.

THE Adelaide Hospital, Dublin, has been the victim of a very serious defalcation on the part of its secretary, a Mr. Franklin, who has disappeared with about £1,500 of the hospital funds. The police have the business in hand, but have not yet been able to present their compliments to the errant official. The financial management of the institution was, we believe, in the hands of a lay committee, who accepted a security of only £300 from the ex-secretary. The most serious part of the defalcation arises, we understand, in connection with the extensive building contracts with which the hospital is, and has been, engaged.

## Jervis-Street Hospital, Dublin.

DR. WILLIAM STOKER, F.R.C.S.I., has been appointed to the Surgeoncy of Jervis-Street Hospital, vacated by the removal of Dr. Kilgariff to the Mater Misericordiæ Hospital. Dr. Stoker is a Demonstrator in the School of the Royal College of Surgeons, and son of Dr. Edward Stoker, one of the Surgical Court of Examiners of the College.

ACCORDING to the Registrar-General's official returns the rates of mortality per 1,000 last week in the principal cities and large towns of the United Kingdom were :—Portsmouth 17, Leicester 17, Bristol 18, Hull 19, Plymouth 19, Edinburgh 21, Brighton 22, Norwich 23, Birmingham 23, Sunderland 23, Nottingham 23, Newcastle-on-Tyne 23, London 24, Glasgow 24, Bradford 25, Sheffield 25, Wolverhampton 26, Leeds 28, Oldham 35, Liverpool 36, Dublin 38, and the highest rates 39 in Manchester and Salford.

THE death-rate from the seven principal zymotic diseases last week averaged 2·6 per 1,000 in the principal large towns, and ranged from 0·4 and 0·5 in Hull and Bristol, to 4·4 and 5·2 in Salford and Leeds. Scarlet fever showed the greatest fatality in Salford and Sunderland; whooping-cough in Manchester, Leeds, and Sheffield. The deaths from enteric fever were proportionally most numerous in Newcastle-on-Tyne. Small-pox caused 17 more deaths in London, 16 in Dublin, but not one in any of the other large towns.

AT the last competitive examination of candidates for the Indian Medical Service, thirty presented themselves, and all passed. As there were but fourteen vacancies, the question naturally arises, What will become of the balance? Will they go to recruit the much despised Army Medical Service, or wait for vacancies in the Indian?

THE Curatorship of the Irish College of Surgeons, vacated by the death of Dr. John Barker, will be filled up on the 6th of June next, and it will be necessary for competitors to send, for the inspection by the Council of the College, a number of preparations guaranteed to have been made by themselves. The salary to a competent pathologist and histologist, and one capable of doing justice to the museums, will be £250 a year, subject to increase, if his merits deserve it. But—so far as we know—no candidate presenting those qualities has as yet offered himself.

THE following changes have taken place in the medical staff of some of the Dublin Hospitals :—M. J. Kilgarriff, F.R.C.S.I., Surgeon to the Mater Misericordiæ Hospital, vice Mr. Tyrrell, deceased. William Stoker, F.R.C.S.I., Surgeon to Jervis Street Hospital, in the room of Mr. Kilgarriff, resigned. F. A. Nixon, F.R.C.S.I., Surgeon to Mercer's Hospital, vice Mr. McDowell, deceased. Dr. J. M. Redmond, L.R.C.S.I., Temporary Physician to Cork Street Fever Hospital, vice Dr. Gunn, resigned; and W. Crozier, L.R.C.S.I., House-Surgeon to the Meath Hospital.

THE Physiciancy to the county of Dublin Prison at Kilmainham has become vacant, by the resignation of Dr. Rutherford Kirkpatrick, who has held it only a few years. The salary is £100, and the gift of the office is in the hands of the Lord Lieutenant.

## The Election of a Surgeon to the Lock Hospital, Dublin

In the room of the late Dr. McDowell, which had been the occasion of much interest in the profession in Dublin, took place on Saturday last. The appointment lay with the Board of Governors and the salary is £100. Dr. Henry Fitzgibbon, Surgeon to the City of Dublin Hospital, son of Master Fitzgibbon, and brother of the Lord Justice of Appeal for Ireland, was chosen out of eight candidates by a majority of one vote in a Board of fifteen members.

## Dublin Medical Wills.

We understand that the late Dr. John Barker, Curator of the Museums and Examiner in Materia Medica in the Royal College of Surgeons in Ireland, bequeathed to the College the reversion of a sum of about £3,000, with the suggestion that the interest of it should be applied in granting prizes to students for the most skilfully made dissection suitable for preservation in the College museums. A further suggestion is offered that a sum of £10 be granted to the Curator, for the time being, to enable him to entertain the successful competitors for these prizes at dinner.

We also understand that Dr. Ledwich has bequeathed the sum which may be realised by the purchase of his vacated surgeoncy at Mercer's Hospital—probably about £1,200—to the Board of Governors of the Hospital, to be applied by them to building in connection with the institution. But if the vacant surgeoncy be not filled up within three months, the money is to pass to the Adelaide and Meath Hospitals.

Amputation at the hip was performed on Saturday last, the 1st inst, in the Adelaide Hospital, Dublin, by Mr. B. Wills Richardson. Compression of the common iliac artery was made with Mr. Richard Davy's wooden lever passed up the rectum, which so effectually controlled the vessel that the operation was almost bloodless.

# Scotland.

Edinburgh Royal Society.—The sixth ordinary meeting of this Society for the present session was held on Feb. 17, in the Royal Institution. Professor Killand in the chair. The first communication read was one by Mr. J. B. Haycraft, M.B., C.M., on "some Physiological Results of the Temperature Variation." After stating that some seasons of the year were more prolific of births than others, the paper proceeded to give some facts bearing on the question, deduced from the study of the registers of eight towns in Scotland. In these towns there were 3,387 births in April, the largest number, and 2,915 in August, the smallest number. The average number of births, taking all the year round, was 3,127 per month. The number of marriages contracted in January was very high. The number fell through February to March; rose a little in April; fell materially in May; rose to its maximum in June; showed a slight fall in July; fell again in August; and so on with a slight rise in November and December. The other papers read were, on the "Elasticity of the Walls of the Arteries and Veins," by Dr. Reyl; and a "Note on the Distribution of Temperature under the Ice in Linlithgow Loch," by Mr. J. Y. Buchanan.

Ovariotomy in Scotland.—Dr. Thomas Keith has just separately issued in pamphlet form a paper on this subject read on the 10th October, 1878, at the East Surrey District Meeting of the South-Eastern Branch of the British Medical Association. We have much pleasure in directing attention to the paper. No one can refuse to Dr. Keith the credit to which his marvellous success in the performance of a most grave operation entitles him. Strange, however, that one with such good hands should be so stinted in mind as to believe in Mr. Lister's "antisepticism." "A large blood-clot organised in the wound of a compound fracture!" Nature's cycle is never interrupted in this way. Why should not a bit of beef-steak become similarly organised? We are quite prepared to hear of a bit of sponge or a pair of scissors becoming organised under the antiseptic spray. The one is not less dead than the other. The antiseptic fallacy of the nineteenth century has retarded the cause of scientific medicine for two hundred years.

Edinburgh Royal Infirmary—Proposal for furnishing by the Lord Provost.—At the last meeting of the managers of the Royal Infirmary, Lord Provost Boyd stated that, in view of the new buildings being ready for occupation in the course of this year, it would be desirable that attention be directed to the fact that a large quantity of new furniture would be required. He said that the state of the funds showed that a considerable sum of money would still be necessary to open the institution free of debt, and it would be unfortunate if that debt had to be increased by the purchase of furniture. The times, unfortunately, were not propitious for making a general appeal for subscriptions; but he thought several public bodies, if suitably approached, might not be unfavourable to furnishing one or more wards, the cost of each of which, including the rooms connected therewith, would be about £300. In addition to the subscription of £1,000 by the Town Council, towards the erection of the buildings, he hoped they would agree to furnish three wards of the New Infirmary. Then there were, the Royal College of Physicians, the College of Surgeons, and other bodies which might act similarly. Mrs. Buchanan, Moray Place had endowed a ward in memory of her husband.

"Spiritualism."—The tricks of the contemptible delusion termed *Spiritualism* were successfully exposed in the New Public Halls, Glasgow, on the evenings of the 25th and 26th ult., by Mr. Bishop, a young American gentleman, who had just been entertaining and instructing in a similar manner, the Modern Athenians. Mr. Bishop was invited to Glasgow by the University authorities, who mustered in great force on the occasion of both *séances*, if Mr. Bishop will pardon us the use of the word. The proceeds of both meetings were in aid of the funds of the Western Infirmary. Mr. Bishop was ably assisted in his well executed and interesting performances by the learned Professor of the University; and Dr. Gairdner perfectly out-did himself in *his* usual *rôle* of exhausting the forbearance of the audience. When he began to talk of the *minutiæ* of the brain structure, and his own early *history*, the audience could stand it no longer. It certainly was not unnecessary on his part to inform the audience that "personally, he had never been a believer in Spiritualism." Dr. Gairdner considered the whole matter "a diseased condition of the Faculty of Wonder." Well done, Science!

# Medical News.

**Indian Medical Service.**—List of candidates for Her Majesty's Indian Medical Service who were successful at the competitive examination held at Burlington House on the 17th February, 1879. 28 candidates competed for 14 appointments. All were reported qualified.

## NOTICES TO CORRESPONDENTS.

DR. GRIFFITH.—Unfortunately we have been as yet unable to put your MS. in type in consequence of great press of matter; an early proof shall be sent you.

DR. L. JOHNSON.—"On Blood-letting" received.

SANITARY LECTURES TO THE POPULACE.—Mr. T. P. Teale, F.R.C.S., of Leeds, delivered the first of a course of lectures on sanitary subjects under the auspices of the National Health Society, last week in London, entitled "Below the Floors and Behind the Walls in Modern Houses." The lecturer dealt with the commonest dangers lurking in papers, paints, drains, and cisterns, showing by means of diagrams how and where they existed, and how they could be best remedied. We regret that our space is too much occupied to give the lecture in full; indeed, it is more suitable for the lay press, where its publication would do immense good.

DR. S. M. is thanked; he will find the paragraph inserted in another column.

MR. BIRCHENALL, Macclesfield.—"Cases of Cholera and Relapsing Fever" received.

DR. W. H. DAY.—"On some Heart Diseases in Children." The illustrations are in the hands of the engraver.

INDIAN MEDICAL SERVICE.—Notice will be found in our advertising columns that the next examination for candidates in Her Majesty's Indian Medical Service will not take place till August next.

THE GOULSTONIAN LECTURES will be delivered at the Royal College of Physicians of London on March 7th, 12th, and 14th, at 5 o'clock, by Dr. Curnow, the subject being "The Lymphatic System and its Diseases." Members of the profession are admitted on presentation of card.

PSYCHOLOGICUS should read Dr. Stretch Dowse's monograph on the subject, he would there find a complete answer to his queries. The title of the work is "Syphilis of the Brain and Spinal Cord," being the first volume of "The Brain and its Diseases."

THE Medical Society of the College of Physicians of Ireland will meet on Wednesday next at 5 o'clock, when the following communications are set down for reading: Dr. Grimshaw, "On Thoracic Aneurism Simulating Mediastinal Cancer."—Dr. Nixon, "On Lateral Sclerosis of the Cord."

DR. BRERETON, Oughterard.—"Local Fixation during Operation" received,

DR. F. V. MCDOWELL, Baltinglass.—"Case of Ascites complicated with Œdema of Scrotum" received.

THE next evening meeting of the Pharmaceutical Society of Great Britain will be held on this day, March 5, at 8.30 precisely, when the following papers will be read: "The Estimation of Diastase," by Messrs. W. R. Dunstan and A. F. Dimmock.—"Extract of Malt," by Messrs. W. R. Dunstan and A. F. Dimmock.—A special evening meeting will be held on March 19, when Prof. Bentley will lecture on "The Life of the Plant."

OBSTETRICAL SOCCIETY OF LONDON.—This evening (Wednesday), at 8 o'clock, Specimens will be shown by Drs. Roper and Galabin. Papers: Dr. Wilson, "Notes on a Deformed Fœtus."—Dr. Scholefield. "Difficult Delivery of a Monstrosity."—Dr. Roper, "Report of a Case of Fatal Thrombosis of Right Heart Nineteen Days after Delivery, with remarks."—Mr. Musgrave, "Case of Abortion followed by Septicæmia and Fatal Thrombosis."—And other papers.

DR. MCN. JONES, Cork.—Communication, "On Adenoid Tumours of the Naso-Pharynx," Nos. I. and II., received.

DR. DUKE, Dublin.—Communication received.

HARVEIAN SOCIETY OF LONDON.—On Thursday, March 6, at 3.30 p.m., "Cases to Illustrate certain common characteristics of Chronic Disease," by Dr. Fitzpatrick.—"Some forms of Heart Failure from High Pressure," by Dr. Mahomed.

D. CROFTON, B.A., Dublin.—"On the Therapeutical Effect of the Fumes from Burning Nitre Paper in Asthma" received.

VARIOLA.—It is impossible to answer the question. The period of purification of a small-pox potient depends altogether upon the disinfective processes pursued. A diligent course of Turkish baths, fresh air, and clean clothes may enable a patient to go about safely in a few days, while one of the unwashed could not venture for a month.

ERRATUM.—For "Ordor Psychologicus" in our last issue read "Odor Psychologicus."

### BOOKS AND PAMPHLETS RECEIVED.

Our Services under the Crown. By Surgeon-Major Albert A. Gore. London: Baillière, Tindall, & Cox.

Text-book of Materia Medica and Pharmacy. By W. Handsel Griffiths, Ph.D., and G. F. Duffey, M.D. Dublin: Fannin & Co. London: Baillière, Tindall, & Cox.

Naval Hygiene. Second Edition. By J. Wilson, M.D. Philadelphia: Lindsay & Blakiston.

Opening Address to the Students attending the Aural Clinique at the Glasgow Western Infirmary. By Thos. Barr, M.D. Glasgow: Maclehose.

The Brain and its Diseases. Vol. I. Syphilis of the Brain and Spinal Cord. By T. Stretch Dowse, M.D., F.R.C.P. London: Baillière, Tindall, & Cox.

Diphtheria; its Nature, Varieties, Pathology, &c. By R. Hunter Semple, M.D., F.R.C.P. London: Baillière, Tindall, & Cox.

The Physiology and Pathology of the Sympathetic Nerves. By Drs. Eulenburg and Guttman. Translated by Dr. Napier. London: J. & A. Churchill.

The Anatomy of the Joints. By Hy. Morris, F.R.C.S. London: J. & A. Churchill.

Medical Men and Manners of the Nineteenth Century. Second Edition. London: Baillière, Tindall, & Cox.

Domestic Poisons. By Hy. Carr, C.E. London: Ridgway.

Handbook for Injuries or Sudden Illness. By P. Shepherd, M.D.

Report on the Exhibits connected with Materia Medica, Pharmacy, Chemical Industry in the Paris Exhibition. By Messrs. Paul, Holmes, and Passmore.

Fifty Years Ago. By Hy. Gibbons, M.D.

Are Inebriates Automatons?

The Classified Directory to the Metropolitan Charities for 1879.

On Fracture of the Femur. By E. Borck, M.D.

An Abdominal Shield. By Francis Vacher, M.R.C.S.

A Talk with the Boys about Tobacco.

Brain. Part IV.

Godlee's Atlas of Human Anatomy. Part VIII.

Eleventh Annual Report of the English Anti-Tobacco Society.

The Registrar-General's Quarterly Returns, Oct. to Dec., 1878.

The Local Government Board Blue-Book, 1878.

Report of Medical Officer of Health for Stroud, 1878.

Statistical Report of the Health of the Navy, 1878.

Journal of the Royal Microscopical Society. Vol. II. No. 1.

The Practitioner. Vol. XXII. Nos. 2 and 3.

Bentley and Trimen's Medicinal Plants. Parts 33, 34, 35, 36, 37.

### VACANCIES.

Dorset County Hospital.—House Surgeon and Secretary. Salary, £80, with board. Applications to the Chairman, at Dorchester, before March 19.

Glanford Brigg Union.—Medical Officer for the Winterton District. Salary, £50, with fees extra. Applications to the Clerk before March 12.

Ledwich School of Medicine and Surgery.—Professor of Materia Medica and Therapeutics. Election, March 15. (See Advt.)

Leeds General Infirmary.—House Physician. Salary, £100, with board. Applications to Dr. Heaton, the Infirmary, Leeds, before March 19.

Leith Hospital.—House Surgeon. Salary, £70, with board. Applications to the Secretary, by March 7.

Liverpool Royal Infirmary.—Resident Medical Officer. Salary, £100, with board. Applications to the Chairman of Committee before March 12.

Macclesfield General Infirmary.—Senior House Surgeon. Salary, £100, with £10 extra for the second year, with board. Also a Visiting House Surgeon to visit patients at their homes. Salary, £70, with board. Applications to the Chairman, Macclesfield Infirmary, on or before March 22.

Monaghan Union, Scotstown Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, March 13.

Owens College, Manchester.—Demonstrator and Assistant Lecturer in Physiology. Salary, £150. The Dean of the Medical School will give further information if desired.

Ripon Dispensary.—House Surgeon and Dispenser. Salary, £100. Applications to the Hon. Sec.

Sunderland Union.—District Medical Officer. Salary, £100, exclusive of fees. Applications to the Clerk to Guardians before March 10.

Tipperary Union, Cappagh Dispensary.—Medical Officer. Salary, £110, with fees, and £20 as Sanitary Officer. Election, March 15.

West Ham Union.—Medical Officer for the Walthamstow District. Salary, £120, with extra fees. Immediate application to the Clerk at Leytonstone, E.

### APPOINTMENTS.

ALLEN, J. G., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer and Medical Officer of Health for the Rich Hill Dispensary District of the Armagh Union.

CADGE, W., F.R.C.S., Consulting Surgeon to the Norwich Dispensary.

CLARKE, T., M.D., an Assistant Physician to the Hospital for Consumption and Diseases of the Chest, Liverpool.

COLEMAN, A., L.R.C.P.L., F.R.C.S E., & L.D.S., Lecturer on Dental Surgery and Pathology at the Dental Hospital of London.

CROZIER, Mr. W. G., Resident Surgeon to the Meath Hospital, Dublin.

CULLINGWORTH, C. J., M.R.C.P.L., M.R.C.S., Lecturer on Medical Jurisprudence at Owens College, Manchester.

DUCKSWORTH, R. H. D'Olier, L.R.C.S.I., Medical Officer to the Borris-in-Ossory Dispensary, Donaghmore Union.

EADE, P., M.D., F.R.C.P.L., Consulting Physician to the Norwich Hospital.

## Births.

BURGESS.—Feb. 20, at Coagh, co. Tyrone, the wife of R. B. Burgess, L.R.C.P.E., of a daughter.

DOLAN.—Feb. 24, at 32 North Parade, Halifax, the wife of J. M. Dolan, L.R.C.P., of a daughter.

SANDERSON.—Feb. 23, at Penrith, the wife of T. D. Sanderson, M.B., F.R.C.S., of a son.

## Deaths.

ANDERSON.—Feb. 22, at Glasgow, Dr. William Neilson Anderson, of Irvine, aged 41.

BENNETT.—Feb. 15, at Low Risby, Lucas Marshall Bennett, M.R.C.S., of Winterton, aged 69.

BROWN.—Feb. 21, at Coldstream, Berwickshire, Alex. Brown, L.R.C.P., aged 48.

ELLIS.—Feb. 16, at Prince of Wales Road, Scarborough, William Ellis, M.R.C.S.E., aged 65.

FENTON.—Feb. 26, at San Remo, G. F. Fenton, M.R.C.S., L.R.C.P.Ed., aged 25.

GODRICH.—Feb. 27, at 140 Fulham Road, London, S.W., F. Godrich, M.R.C.S., aged 50.

HARBORD.—Feb. 20, at Margate, William Harbord, M.R.C.S., L.S.A.L. (late of Wainfleet, Lincolnshire), aged 47.

HASLAM.—Feb. 18, at Northampton, James Haslam, M.R.C.S.E., aged 35.

PERRY.—Feb. 19, at Douglas, Isle of Man, John Perry, F.R.C.S.E., of Gillingham Street, Eccleston Square, aged 75.

SHEPPARD.—Feb. 18, at Clifton, William Yeoman Sheppard, F.R.C.S.E.

WEAVER.—Feb. 28, John Weaver, M.R.C.S.E., of Chester, aged 82.

# IRISH POOR-LAW INTELLIGENCE.

## IRISH MEDICAL ASSOCIATION.

Local Government Board,
Dublin, 20*th September*, 1878.

SIR,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 13th instant, requesting, by direction of the Irish Medical Association, the attention of the Board to the subject of remuneration of Dispensary Medical Officers for their attendance and evidence in cases of prosecutions of defaulters under the Compulsory Vaccination Act, in which you refer to a letter recently addressed by the Board to the Guardians of Ballinasloe Union to the effect that in ascertaining and certifying the amount of the expenses incurred in such proceedings the Magistrates ought to allow a reasonable sum, not as a fee, but for his expenses, to the Dispensary Medical Officer if he should be required to attend as a witness; and in reference thereto the Board desire to inform you that the letter to which you refer was written in accordance with the terms of a circular letter addressed by direction of the Lord Lieutenant to Magistrates at Petty Sessions in 1876.

A copy of the circular is enclosed.

By Order of the Board,
B. BANKS, *Secretary.*

To John William Moore, Esq., M.D.

*Copy of Circular to Magistrates at Petty Sessions.*

Dublin Castle,
31*st August*, 1876.

GENTLEMEN,—I am directed by the Lord Lieutenant to acquaint you, for your information and future guidance, that in all cases of proceedings brought before your Bench by direction of the Guardians of the Poor for non-compliance with the Vaccination Act, his Grace is advised that under Section 13 of the 26 and 27 Vic., c. 52, the Justices before whom the prosecution is had may and ought to certify for payment out of the poor rates of any expenses incurred in such proceedings; and in ascertaining the amount of such expenses to allow a reasonable sum, not as a fee, but for his expenses to the Dispensary Medical Officer of the District, if he should be required to attend as a prosecutor or witness.

I am, Gentlemen,
Your obedient Servant,
T. H. BURKE.

Dublin Castle,
19*th November*, 1878.

SIR,—With reference to your letter of the 24th ultimo, conveying the views of the Council of the Irish Medical Association respecting the instructions contained in the circular of the 31st August, 1876, from this Department to Magistrates at Petty Sessions relative to expenses of Dispensary Medical Officers under the Vaccination Act, I am directed by the Lord Lieutenant to acquaint you, for the information of the Irish Medical Association, that the subject is under consideration with a view to improving the position of the Medical Officers by legislation, but that, as the law stands, his Grace is advised that the Executive can do no more than has already been done by the circular of 31st August, 1876, which was intended to assist the Medical Officers in their applications to the Justices for the allowance of some more reasonable compensation than the amount of their actual expenses.

I am, Sir,
Your obedient Servant,
HENRY ROBINSON.

To J. W. Moore, Esq., M.D.,
Honorary Secretary to the Council of
The Irish Medical Association,
Royal College of Surgeons,
Stephen's Green.

Irish Medical Association,
Royal College of Surgeons,
Dublin, 30*th November*, 1878.

To the Right Hon. James Lowther, M.P.,
Chief Secretary for Ireland.

Sir,—I am directed by the Council of the Irish Medical Association to acknowledge the receipt of your letter (No. 19,429) of the 19th inst., relative to remuneration of Dispensary Medical Officers under the 13th Section of the "Compulsory Vaccination Act," from which the Council are gratified to learn that the subject is under the consideration of his Grace the Lord Lieutenant with a view to improving the position of the Medical Officers by legislation.

With reference to the statement therein contained that "the circular of the 31st August, 1876, was intended to assist the Medical Officers in their applications to the Justices for the allowance of some more reasonable compensation than the amount of their actual expenses," I am directed to remark that so far from the intention of the Executive, as now expressed, having been observed by the Justices, the circular referred to was in almost every instance cited by them as the *only reason* for not allowing to the Medical Officers the remuneration they applied for.

The Justices appear to have considered that they were directly prohibited from certifying for the remuneration of a medical officer by the instruction contained in the circular, viz.: "In ascertaining the amount of such expenses to allow a reasonable sum, *not as a fee*, but for his expenses." The Council, however, are greatly pleased to learn that the intention of the Executive was so

widely different from the effect given to the circular of the 31st August, 1876, but nevertheless serious mischief has since resulted to the public interest, and a very large number of Medical Officers have been unjustly deprived of legitimate remuneration, and consequently discouraged in the discharge of their duties; and the Council believe that until the intention of the Executive be authoritatively communicated to the Justices, and acted upon by them, the Medical Officers cannot be expected to bestow the amount of care and attention necessary to prevent unvaccinated—or imperfectly vaccinated—persons passing unnoticed, or trouble themselves to report all instances of default.

The Council therefore trust that his Grace the Lord Lieutenant will see the advisability of issuing new instructions as soon as possible to the Justices, in order that the misconception under which they appear to labour may be removed without delay; and I am to state that if such instructions be issued, and the Council be informed of them, they will lose no time in making them known to the Dispensary Medical Officers, and will take the opportunity of advising that the utmost vigilance on the part of the Medical Officers should be exercised to give a full and thorough effect to the vaccination laws.

The Council have a two-fold interest in the success of vaccination, viz.: the public welfare and the interest of the Medical Officers, the former of which almost entirely depends on the encouragement given to the Medical Officers.

The Council are also gratified at the assurance that new legislation on the subject of vaccination is contemplated; and I am directed to observe that two bills—one to amend, the other to consolidate and amend, the vaccination laws of Ireland—were drawn up by the Council of this Association, copies of which were forwarded to the Right Hon. Sir Michael E. Hicks-Beach (then Chief Secretary for Ireland) in the early part of the year 1876, in the hope that either of them might be introduced in Parliament as a Government measure.

I have the honour herewith to forward a copy of each of these proposed bills for your consideration, and am directed to request that you will have the goodness to inform me, for the information of the Council, whether it is contemplated to introduce either of them as a Government measure in the approaching session of Parliament, or in the event of such not being the intention, whether if introduced as private bills at the instance of individual members of Parliament, either of them would meet with the support of the Government? I am further directed to add that the Bill to Amend the Vaccination Laws has been authoritatively approved by the Council of this Association, the Board of Trinity College, Dublin, the College of Physicians, and the Royal College of Surgeons in Ireland.

*(To be continued.)*

## LIMERICK SANITARY BOARD.

### SANITARY SALARIES.

Local Government Board,
Dublin, 7th Feb., 1879.

SIR,—The Local Government Board for Ireland forward herewith, to be laid before the Limerick Urban Sanitary Authority, a copy of a letter which they have received from the medical officers of the Limerick City Dispensary District, relative to their salaries as sanitary officers; and in reference thereto the Board desire to state that their application for an increase of salary appears to them very reasonable. When the amounts were originally fixed there was considerable uncertainty as to the extent of the duties likely to be attached to the situation, but experience has shown that the duties to be performed are arduous, and they are of the highest importance in a sanitary point of view, and the Board think that the sanitary authorities should not hesitate to make a substantial addition to the small salaries now allowed to the sanitary officers.

By order of the Board,
B. BANKS, Secretary.

Limerick, 1st February, 1879.

Gentlemen,—We, the undersigned medical officers of the Limerick City Dispensary District, wish to bring the following facts under your notice, since our appointments as sanitary officers our duties have been much increased, and again had by being asked to furnish a weekly return under various holdings as you are already aware.

We consider the lowest salaries we ought to receive for the onerous duties devolved upon us should be £50 per annum each.

Signed,
JONATHAN ELMS, M.D.
THOMAS J. GELSTON, M.D.
JOHN HOLMES.
F. W. O'CONNOR, Physician and Surgeon.

Ultimately it was decided that no further increase should be made in the salaries of the medical officers; and it was not deemed necessary that the returns should be sought for.

## CASTLEBLAYNEY UNION.

### LUNACY FEES.

The Clerk read the following letter:—

"SIR,—The Local Government Board for Ireland have had before them the minutes of proceedings of the Board of Guardians of Castleblayney Union on the 5th inst., enclosing a letter from Dr. Anderson, medical officer of Newtownhamilton Dispensary District, relating to the payment of his fee for certifying as to the lunacy of a maniac, and in reference to the guardians' resolution on the subject the L. G. B. desire to state that the justices having certified for a sum of £1 10s. for the certificate of lunacy the medical officer is entitled to receive the sum certified for under the 14, 38 and 39 Vic., cap 67. At the same time the L. G. B. think it is to be regretted that Dr. Anderson did not adopt a more respectful tone in addressing the guardians on the subject.

"By order of the Board,
"B. BANKS, Secretary."

After considerable discussion on the subject, the Board agreed to pay Dr. Anderson £1 1s., what has been paid heretofore in such cases.

### VACCINATION PROSECUTIONS.

"Sir,—The Local Government Board for Ireland acknowledge the receipt of the minutes of proceedings of the Board of Guardians of Castleblayney Union on the inst., containing an entry of the receipt of the return of defaulters under the Compulsory Vaccination Act in the district of Dr. Clarke, and with reference to the statement that prosecutions were not ordered, as the date of giving the notice under the 8th section of the Act was not given in the return, the L. G. B. has to point out that the return should be sent back to the medical officer for correction, so that the provisions of the Compulsory Vaccination Act may be carried into effect as regards these defaulters.

"By order of the Board,
"B. BANKS, Secretary."

## TRALEE UNION.

### CASTLEISLAND HOSPITAL.

MR. ROCHE said that the occupier of the field upon

which they fixed the site for the hospital, had consented to give them the field.

Mr. Kenny said that being so, he thought the next step was to get the doctors at Castleisland to give an undertaking in writing that they would attend to the patients in the hospital without additional remuneration. He suggested that the solicitor to the board should prepare the document.

Mr. Roche said he thought that was quite unnecessary.

Mr. Kenny—Then for the safety of the board I can tell you it would be no harm to have it done, *lest the doctors should shirk from their promises.*

Chairman—Oh, I think, Mr. Kenny, that once a gentleman promises to do such a thing his word is quite enough.

Mr. Kenny said he merely threw out the suggestion for the information of the guardians and for the safety of the ratepayers.

Mr. Roche said all that was necessary was a formal undertaking in writing to be signed by the doctors, and that would go on the minutes to the Local Government Board.

Chairman—That will be quite sufficient. A gentleman who gives a thing under his hand, there is no fear he will back out of it.

The matter then dropped.

At a subsequent meeting of the same Board the clerk read the following copy of an undertaking :—

I hereby undertake to attend the proposed district hospital in Castleisland as medical officer in conjunction with the medical officers of the Castleisland Dispensary district, during such time as I hold the office of medical officer of the Brosna No. 2 Dispensary District, and to visit same as often as may be necessary, without requiring any remuneration in addition to my salary as dispensary medical officer.

Signed,

RICHARD HARROLD.

Feb. 9, 1879.

Mr. Quinlan—I think Dr. Nolan should have signed this too.

Chairman—I think what Dr. Nolan wants is to attend only to patients he orders in himself. He says he will attend only to those from his own district, but I think he means that he is to admit them himself.

Mr. M'Mahon—Who'll attend to the Brosna patients, then, sir?

Mr. Quinlan—Dr. Nolan says he won't, and Dr. Harrold won't either.

Mr. M'Mahon—Oh, Dr. Harrold will.

Mr. Sullivan—Dr. Harrold promised that he would attend.

The matter then dropped.

[We congratulate the Tralee Guardians on the possession of medical officers who are ready to kiss the whip that scourges them with so much meekness and complaisancy ; but why medical men should undertake the medical charge of a hospital without pay, and should submit—for no reward—to the insult of a doubt of their honesty and truthfulness, passes our comprehension.—ED. M. P. & C.]

## DOWNPATRICK GUARDIANS.

### SANITARY PROSECUTION FEES.

THE Clerk then read the following communication :—

Local Government Board, Dublin,
14th February, 1879.

SIR,—The Local Government Board for Ireland have had before them a minute of the Board of Guardians of Downpatrick Union of the 8th inst., in reference to the claim of Dr. Filson, sanitary officer, for remuneration for his attendance at petty sessions in certain sanitary prosecutions ; and I am to state that unless there was a distinct arrangement made with the sanitary officer on the subject, he is in the opinion of the Local Government Board, under the 258th section of the Public Health Act, entitled to be remunerated for his services above referred to.

By order of the Board,

B. BANKS, Secretary.

Mr. Bowes said that in this case the magistrates gave the fine to the sanitary authority, intending that the doctor should be paid out of it. Under the Act the magistrates were empowered to give the fine to the sanitary authority or to the informer. Dr. Filson, he supposed, was the informer in this case, but the order made was to give the money to the sanitary authority.

The Chairman said that if there was any misunderstanding about these doctors' salaries the best thing they could do was to take the subject into their consideration, and make a distinct bargain with them as to what they are to be paid for these duties. The salary that was originally given was undoubtedly intended to cover all expenses, but by some kind of loop-hole this claim was put in as an extra thing. To keep themselves safe, he thought they ought to take the doctors' salaries into consideration, and make them more distinct, because it was evident from the letter just read they would have to pay in this case.

Mr. Lowry—Unless it was distinctly understood—

The Chairman—Dr. Filson says he did not understand the salary was to cover all.

Dr. Roughan—As far as these fees are concerned, I think you will have to pay Dr. Filson.

Mr. Bowen—The Board will be at no loss, because the magistrates have given the whole of the costs to the sanitary authority. I know the duty these doctors have to perform is a very disagreeable one. I believe Dr. Filson has lost clients by it ; for the people blame him for making reports, and they go to other doctors. He says he would rather not have the office.

The Chairman—I think we had better convene a full board to take the doctors' salaries into our reconsideration in connection with the sanitary duties.

The suggestion was then agreed to, and that day fortnight was appointed for the purpose.

Some conversation then took place as to the amount of fees to be given to Dr. Filson.

Major Nugent moved that he be paid six guineas.

Mr. Lowry—Supposing that the sanitary officer in Downpatrick brings a case before the magistrates, and they adjourn it to the next day, and the next, is the doctor to get two guineas for each day ?

Dr. Roughan—I am afraid he is entitled to it.

The matter then dropped.

## BORRIS-IN-OSSORY DISPENSARY.

THE Committee of the District held a meeting to elect a Medical Officer in room of Dr. White, resigned.

The Secretary read the minutes of the last meeting, and informed the Committee that he had received only one application for the vacant office, that of Dr. Richard Henry D'Olier Duckworth, 11 Pembroke Road, Dublin.

There being no other candidate Dr. Duckworth was declared unanimously elected.

Captain Gibson.—Every gentlemen in the room will agree with me that our business would not be complete to-day without some expression of opinion on the part of us about Dr. White. This is a very suitable occasion to place on record some feeling of regard and some feeling of friendship towards a man who has filled the position of doctor to this dispensary for forty-one years. Therefore I would venture to propose that the committee regret very much Dr. White's resignation from failing health. They express their sympathy with him, and assure him that he will carry

into private life the cordial feelings of esteem and friendship with which he has always been regarded by the Committee. To give tangible effect to our feelings I would suggest that there might be a something else done, and I would propose that a small subscription be opened now, in order to present Dr. White with a purse of sovereigns. If any gentleman likes to move an amendment that a large subscription be opened I shall be happy to second it also. (Hear, and a laugh). Captain Gibson then proposed the following :—"That this Committee desire to place on record their great regret that Dr. White has been compelled from ill health to resign the position of Medical Officer of Borris Dispensary, which he has held for the last forty-one years, and beg to assure him that every member of the Committee entertain for him the most cordial feeling of esteem and regard," which passed unanimously.

## PROSECUTIONS FOR SELLING DISEASED MEAT IN IRELAND.

At Granard Petty Sessions on Wednesday two butchers were prosecuted for exposing for sale in the town of Granard, meat pronounced by the Medical Officer of Health, Dr. Bucknill, to be unfit for human food. Dr. Buckley applied for £2 as his fee for attending to prosecute. The Clerk of the Union produced a resolution of the board limiting the fee of the medical witness in such cases to £1. The magistrates allowed the £2, placing the amount, as costs of the proceedings, on the defendants in the case, and suggested that the matter should be referred to the Local Government Board.

## MONAGHAN GUARDIANS.

### SCOTSTOWN DISPENSARY—PROPOSED REDUCTION OF SALARY.

The minutes of the Dispensary Committee meetings, at which a resolution was passed reducing the salary from £120 to £100 came before the Board for confirmation.

Mr. Fiddes said the result of the reduction would be that—the district being large and the private practice poor—the proper class of medical practitioners would not apply. He did not think the Local Government Board would sanction the proposal.

Mr. Woods also thought that the salary could not be reduced without diminishing the chance of getting a suitable man.

Mr. Pringle said the case was—Some time since the salary had been raised because provisions were dear, and now, when every necessary of life could be had at a very low rate, he thought the salaries should be lowered. Every necessary being now cheaper than at any time during the last twenty or forty years, he did not see, for the life of him, why the same high rate of wages should be now paid. The doctor, besides, had a residence at a nearly nominal rent, and a populous district to work in. Why, he saw five weddings the other day, and that was surely a grand prospect for a new man. (Laughter.)

The question whether or not the salaries should be reduced was put to the vote, when there polled—against the reduction 8.

For the reduction 3.

The salary was then allowed to remain at the old figure, and

The Board soon after adjourned.

At an earlier period of the same meeting a letter was read from the L. G. B. declining to confirm a resolution to reduce the salaries of the Master and Matron.

"The Local Government Board desire to state that they have already declined to approve the reduced salaries proposed for the offices in question, and that it appears to them that the course pursued on the occasion of the recent election was irregular and unusual.

"Under all the circumstances, the Local Government Board are of opinion that a fresh election should take place, and they request that the Guardians will be good enough to take the usual steps at their meeting on to-morrow for that purpose."

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING FEB. 22, 1879.

| | |
|---|---|
| Total registered deaths in Dublin and suburbs* ... | 227 |
| Ten years average of same week ... ... ... | 192 |
| Excess of mortality above average ... ... ... | 35 |
| 10 weeks' ratio of deaths Rathmines | 27·5 per 1,000 |
| " " " Donnybrook† | 34·0 " |
| " " " Blackrock | 17.3 " |
| " " " Kingstown | 27·5 " |
| " " Entire Dublin District | 37·5 " |
| Comparative Ratios—London ... | 23·8 " |
| " " Glasgow ... | 24·4 " |
| " " Edinburgh ... | 21·2 " |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Although still over the average, the deaths are 110 under the number in the preceding week, and are less than in any week since that ending 7th December last.

Deaths from diseases of the respiratory organs, which, in the preceding five weeks had been respectively 96, 78, 97, 114, and 112, fell last week to 66, of which 49 were ascribed to bronchitis, 11 to pneumonia, 2 to pleurisy, 1 to laryngitis, and 3 to lung disease unspecified. The average number of deaths from these causes in the eighth week of the last ten years was only 45.

Forty-four deaths from zymotic diseases were registered, being 31 less than in the week ending 15th instant, but 9 over the average number in the eighth week of the ten years 1869-78 ; they comprise 16 from small-pox, 8 from fever (1 typhus, and 7 typhoid), 7 from scarlet fever, 3 from croup, 2 each from measles and diarrhœa, 1 from diphtheria, &c.

The deaths from small-pox are 11 less than in the preceding week, and are under the number in any other week for the last two months ; the new cases of the disease admitted into the Dublin hospitals also show a decline, the number for the week being 37, against 62 in the week ending 15th instant. The new cases of typhoid fever and measles admitted into the principal hospitals are under, and those of scarlet fever and typhus over the number for the preceding week, but there were not many cases of any of these diseases.

Fourteen children died from convulsions.

Seven deaths were ascribed to heart disease ; 5 to paralysis, 4 to apoplexy, 1 each to insanity and epilepsy, 2 to brain disease unspecified ; 1 to jaundice, 5 to liver disease unspecified ; and 1 to cystitis.

Twenty-three persons died from phthisis, 3 from mesenteric disease, 5 from hydrocephalus, and 4 from cancer.

Belfast.—Eight deaths from fever, 5 from whooping-cough, 1 each from measles and scarlatina, and 5 from diarrhœa, were registered during the week.

## TO READERS.

The Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention.

### LECTURE III.

### TREATMENT OF ASTHMA.

By JOHN C. THOROWGOOD, M.D., F.R.C.P.,

Physician to Victoria Park Hospital for Diseases of the Chest, and to the West London Hospital.

HAVING in my two preceding lectures endeavoured from the observation and history of cases to point out what distinctions we may recognise among the various forms of bronchial asthma, I now seek to show how far the correct appreciation of these distinctions can be made available to guide us in the choice and application of our remedial measures.

Floyer, writing in 1717, says: "Since the cure of the asthma is observed by all physicians who have attempted the eradicating that chronical distemper, to be very difficult and frequently unsuccessful, I may thence infer that either the nature of that disease is not thoroughly understood by them, or they have not yet found out the medicines by which the cure may be effected." Now if physicians have not yet found out the medicine to cure asthma, it certainly is not for want of experimenting with various drugs and preparations, for there seems hardly a known medicine that has not been tried, and I could enumerate a long list for which distinguished success has been claimed by their respective advocates.

Further to pursue the plan of specific-hunting is hardly likely to advance us much towards what is positive and practical, and the more promising course appears to be to seek to turn to account the knowledge we have gained by experiment and observation of the nature and causation of bronchial spasm and congestion. Thus we may discover how to select and apply some of those numerous remedial means with which we are so amply provided.

Experiment has demonstrated how much respiratory action is under the influence of the pneumogastric nerve, and reflection on the wandering course and numerous connections of this nerve will show why it is that our treatment of asthmatic spasms must be very varied, and is not always so precise in its result as we could desire.

To cure asthma we often have to treat other organs than those of respiration, and the way to success may lie in the correct adjustment of a displaced womb, in the administration of a dose of extract of male fern to dislodge a tapeworm, or in a course of Carlsbad waters for one who perhaps for long has been smoking all manner of cigarettes with little further effect than the production of vertigo and giddiness. Did time permit I could illustrate each of these conditions by a well-marked example.

The capriciousness of asthma, with regard to the influence of various agencies is notorious, and a book might be filled with an interesting collection of cases.

What better illustration can I find than a glance at the effect of atmosphere and climate on persons liable to asthmatic seizures. Theory would say, It is very clear that seeing how bronchial spasm, and air stoppage, must have the effect of carbonizing the blood, a pure air is the first requisite for an asthmatic patient. Practice shows this to be often right in cases of congestive asthma and weakness of vessels generally, but to the victim of true spasmodic asthma a pure clear air is often utterly unbearable, and we find them hurrying away from the clear bracing air of places like Margate, Whitby, and Nice, literally in terror of losing their lives if they pass another night in one of those climates.

The late eminent oculist, Mr. Dalrymple, of Grosvenor Street, when summoned into the country, was not uncommonly compelled to hurry back to London without even seeing his patient, in consequence of the terrible spasm in his breathing that came on in the pure air of the country.

Salter has gone carefully into the history of twenty

(a) Delivered before the Medical Society of London. Erasmus Wilson, F.R.S., President, in the Chair.

cases of asthma powerfully influenced by atmosphere; the evidence adduced is of a most opposing character, and of little practical avail. Fourteen out of these twenty cases could respire with comfort only in the smoky air of populous cities; eleven seemed actually cured by London air. Seven others were quite unable to live in cities, and did best in the country. From the perusal of Salter's reports, as well as my own, I cannot find, either in peculiarity of patient, or of atmosphere, the cause of this capriciousness in the way the asthma selects its victims. If it be the dryness of London air that is so wholesome for asthmatic lungs, how comes it that Lord B., as told us by Dr. Ogier Ward, has been obliged to leave London at two o'clock in the morning and drive to Epsom, the intensity of his asthma threatening his life. At Epsom he is said to find immediate ease, and yet the air there is reputed a dry air.

The wonderful relief to breath difficulty experienced by many asthmatics in the close air of a town is continually brought to our notice. One patient of my own, with a most comfortable home in the northern outskirts of London, finds himself glad to quit it and pass a winter in residence at his business premises in Cornhill. Another, who declares that he has vainly tried all the resources of medical art, passed six weeks in Queen Anne Street, Cavendish Square, without feeling a trace of his asthma. On returning home, some few miles south-west of London, he got such a bad seizure, that though well versed by sad experience in his sensations, he was nevertheless obliged to send urgently in the night for his regular doctor. One great sufferer in the country breathed well in London, but wrote me word that on returning home the asthma received him with a most warm welcome. Those who have read Walshe's work on the lungs will remember the case of the man sorely tormented with asthma at Hampstead, for whose relief every known remedy had been vainly tried, and who was cured in an almost miraculous way by changing his residence to the central region of the Seven Dials. To explain why town air suits some asthmatics so well is not easy. Finding that ozone inhaled causes pulmonary irritation, I thought that it might be the absence of ozone that rendered the air of towns sedative to excited nerves in the respiratory passages.

In connection with this question I may refer to the observation of Schönbein, the discover of ozone, who found that when air highly charged with ozone was inhaled it brought on a painful affection of the chest—a sort of asthma with a violent cough, which obliged him to discontinue for a time his investigations. Struck with this, Schönbein got several physicians at Basle to compare their lists of catarrhal patients with his tables of atmospheric ozonometric observations, and he and they were struck by the unusual prevalence of catarrh on the days when the iodine test papers showed that ozone was unusually abundant in the air. The observations of Dr. Carl Haller, of Vienna, prove that catarrhs and pulmonary inflammations rise and fall in frequency, very much in the ratio of the presence or absence of ozone in the air.

Schubler and others experimenting on animals (see Dobell's 3rd volume of "Reports on Chest Diseases"), found that ozone inhaled had an irritating effect on the respiratory organs somewhat resembling the action of chlorine gas. After breathing ozonised air for five or fifteen minutes, catarrhal irritation of the eyes and air tubes came on, the respirations became slow and difficult, and in two or three hours death took place. Post-mortem examination disclosed œdema, and in some cases, inflammation, of the lungs. The discomfort sometimes experienced by asthmatical subjects on a sunny bright day in the neighbourhood of luxuriant vegetation, may be due to the ozone given off by growing plants when exposed to the action of sunshine. That however ozone in the air is by no means necessarily provocative of asthma, is shown by the following facts:—

Dr. Blackley found that he could expose himself to sea air highly charged with ozone, as evidenced by the iodine test papers, and remain perfectly free from anything like asthma and catarrh. A young and bad asthmatic among my own patients was always in great respiratory distress on the sea coast, and naturally enough dreaded a voyage to Australia. He embarked at Gravesend, and while the ship was going down the lower reaches of the Thames he was obliged to resort to his pipe, but once fairly at sea he had no breath difficulty whatever, and wrote to me from Sydney to say the sea voyage had cured his asthma in a way that greatly puzzled him, his own sensations leading him to the impression that the phosphorescence of the sea waves had much to do with the promotion of free respiration. At any rate, the experience of this young man showed that sea-side air may be an effective cause of bronchial asthma in one who fairly out on the ocean in a ship loses every trace of his troublesome disorder. Careful ozonometric observations made during the voyage from Lizard Point to Cape Otway (Victoria), showed that ozone was always present in the air, the amount ranging as from 10° to 3°. If ozone be always in all cases an exciting cause of asthma, one could hardly expect a person eminently subject to the disease to make the voyage to Australia without the least respiratory distress.

I have searched for evidence of asthmatical people becoming attacked after a thunderstorm, when the air is full of ozone. Some there are who are uncomfortable in this sort of air, and among Salter's cases one is mentioned who had asthma complicated with bronchitis, and who was, after a cessation of spasm for some years, attacked unexpectedly and severely after a thunderstorm. When this attack had passed away there was no return for a period of five years.

The facts thus narrated seem to me worth bearing in mind, in hope that increased experience and observation may lead to something more positive in the way of a result than we have a right at present to claim, for as yet we are obliged to say that the climatic treatment of asthma is an experimental affair, and the best practical rules we can lay down appear to be that, if spasm be very pronounced, then probably a town air will suit best. It the attacks are associated with atony of system and loss of vascular tone a dry bracing air seems to me to do most good; and, at all events, if a patient be very bad on a certain soil, or in a certain kind of air, get him away to a locality and air of as different a nature as can be found. A mild, sedative climate, like that of Ventnor or Torquay, will do wonders, I find, for some patients, who suffer greatly with chromo-bronchitis, pulmonary emphysema, and bronchial spasm, when in town, The mild air soothes the irritable muscle, and, causing its free and rhythmical action, allows a more complete aeration of of the blood; hence increase of strength and appetite are among well marked and highly favourable symptoms. In selecting now for consideration some of the very numerous means employed for the relief and cure of asthma, I speak first of the use of certain fuming inhalations that experience has proved valuable in alleviating bronchial spasm. The well-known nitre paper is best made by dissolving 4 oz. of nitrate of potash in a pint of hot water, and in this should be soaked a porous paper of the thickness and consistence of ordinary blotting paper. The paper thus made will be a strong, fiercely burning paper, and should be kept in a stoppered bottle. When used it must be burnt fast and furiously, so as to fill the room, and commonly it is not till the atmosphere is quite thick with nitrous vapours that the asthmatic gets relief. On this point experience leads me to speak strongly. Salter used to say that the more purely spasmodic the asthmatic attack, the more speedy and certain became the relief obtained from the burning nitre paper, and that if any bronchitis was present, then the nitrous fumes might even add to irritation and distress. There is some truth, I am sure, in this statement; nevertheless, a physician, well able to judge, declares that in his asthma and bronchitic cough the fumes of the nitre paper are more effectual than any other remedy in affording relief. The sort

of case to be treated by nitrous fumes is such a one as this. Miss W., aged 20, had asthma since her fourth year. The attacks came and went with great suddenness —evidence, I take it, of their spasmodic nature—and her father, who was himself a medical man, obtained all sorts of advice for her, to no purpose, though when sent to the sea-side she lost her asthma for four months. One morning the state of things stood thus: the young lady was sitting with body thrown forward, shoulders raised, and the noise of the air rushing through the constricted tubes so loud as to be heard in the lower part of the house. A sheet of nitre paper was burnt till the room was filled with a cloud more dense than even a London fog. Scarcely had two minutes passed when, changing her position, she lay back on her pillows, and in ten minutes her delighted father found her breathing as quietly and noiselessly as an infant.

Early one Sunday morning in March, 1870, Dr. Salter, being himself indisposed, asked me to go down into Kent to see a bad case of asthma, to which he had been urgently called. When I got to the patient's house I found him sitting in his drawing-room, feeling pretty comfortable, but his doctor told me that it was not till he had regularly filled the room with a suffocating vapour of burning nitre paper that any relief to the breath was obtained.

This gentleman was sixty years old, and had been asthmatical from the age of twenty. About that time he told me that he consulted a then eminent physician, in Finsbury Square, who, as soon as he saw him, and had heard a word or two of his story, said—

"Little use your coming to me, young man, for I have had asthma all my life, and have it still; if there is anything to do you good, it is strong coffee." This patient lost his asthma while at Ventnor. When he got to his own home, near a river, back it came again, and the fits grew upon him till he became almost black in the face. Dense nitrous fumes surpassed anything else in giving ease to his breathing. I ordered tincture of nux vomica, as a regular medicine, and chloral hydrate to be given when the spasm came on; but the doctor wrote some time after to tell me that calomel pills and decoction of aloes, and nitrous fumes, surpassed any of my remedies in their curative action.

Though experience has taught me the necessity of pretty well smothering a bad asthmatic with the nitrous fumes, still I have come across cases where a small inhalation of a mild nitre paper appears to prevent asthma attaining a climax of severity. The sleeping patient turns and becomes uneasy in his respiration, and then nitre paper burnt near to him may have the happy effect of easing his breath and maintaining a condition of calm repose; if no one is at hand to light the paper, the fit culminates in a wakeful spasm of severe kind, requiring chloroform vapour for its relief.

I cannot ascertain who it was that discovered the value of burning nitre paper to cure the asthma. In the *London Medical Gazette*, of September 4, 1846, there is an article extolling the remedy very highly; and we learn, in the *Lancet* of April 5, 1845, how a friend of Mr. Harrison's tried burning blotting paper that had been soaked in a saturated solution of nitrate of potash, and said he felt the inhaled smoke to clear the passages and open the air tubes; and though he had used this remedy twenty times he had never been disappointed in finding relief in fifteen or twenty minutes.

In America there is a story that an asthmatic man in great distress took out his pipe to smoke, and found he had no tobacco. Feeling that smoke something he must, he lighted his match paper, and stuffed that in the bowl of his pipe. The paper fumed away, and he, as he inhaled the smoke, found it a quicker and better cure than the tobacco had hitherto been.

In Salter's table of 223 cases of asthma, there were 65 to whom nitre paper proved a most valuable remedial agent. Several of these are noted as having emphysema and slight bronchitis to complicate their asthmatical spasm, showing that a slight degree of these two conditions does not invalidate the remedial action of the paper.

## CASE OF ASCITES COMPLICATED WITH ŒDEMA OF SCROTUM.

By FRANCIS VICTOR McDOWELL,
Member Surgical Society of Ireland; Medical Officer Baltinglass District.

A. B., groom, æt. 60, of small stature, consulted me in September last. Until six months previously had been in good health, but had now an unhealthy sallow look. He complained of a "dragging" pain in right side, increased after food; and also of dyspepsia, with inclination to retching; suffers much from general debility, with occasional fits of dyspnœa, especially on lying down.

On examination I found:—Area of hepatic dulness, very circumscribed; considerable enlargement of abdomen; but this did not interfere with his usual occupation. There was not, at this time, œdema of either extremities. The pulse was 95, and compressible; tongue coated.

I advised him to live on plain food, and gave him quinine and podophyllin in pills, and a mixture of nitro-muriatic acid and dandelion.

About a fortnight after this, he came to me again, suffering from violent epigastric pain. I sent him home, telling him to have a warm bath, and giving a chloroform draught, to be followed by a brisk cathartic. By these means he was relieved for a time, but after this attack, jaundice supervened, followed by ascites to an extreme amount, clearly pointing to portal obstruction.

I examined the urine at this stage; the quantity was scanty, and it was loaded with lithates, and an appreciable quantity of bile.

I now saw it was a case for hospital treatment, and, although his friends were anxious to have him placed in a Dublin institution, the inclemency of the weather prevented this. "Time and tide" suffering no delay, they consented to let me operate.

It is unnecessary to describe the condition of patient at this time. He was suffering from the consequences of an enormous accumulation of fluid in peritoneum; accordingly, with one of Fannin's large aspirators, the abdomen was perforated in the usual locality, when six quarts of serum were drawn off. This process, although tedious, was most happy in its results.

After I had secured the opening in abdomen, and having applied a stout bandage, patient said he was "quite well;" he was certainly much relieved.

The case progressed well for six weeks, until œdema of scrotum set in, and kept on increasing to a huge extent. I cannot better describe its appearance than by referring your readers to an illustration of a case in point in Erichsen's "Surgery."

For the relief of this, I used acupuncture needles in four places, which reduced the swelling considerably; but the wounds having healed up, the œdema increased to its former dimensions.

I directed that the under part of scrotum should be supported; but as it became very sore, and as I dreaded sloughing of the parts, I determined to create an opening for evacuation of fluid. I accordingly plunged a very fine silver trochar and canula deep into the pendulous parts, and left the canula in for two days. The result of this also answered my intention, as, at the end of that time, the parts were completely drained and restored to their normal condition without any bad results.

The man is now fairly well; he wears an elastic belt, and, although the diagnosis I formed was chronic and in-

curable disease of liver (probably atrophy), yet I feel sure the progress of the disease has been arrested by the operation.

# Clinical Records.

## MERCER'S HOSPITAL, DUBLIN.

Under the care of Mr. STAMER O'GRADY.

AMONGST the patients in this service whose cases came to a conclusion during the month of January were the following :—

*Hare Lip (Two Cases).*

Both patients were female infants three months old, and with the deformity on the left side. In one,

A. The separation was very wide, the fissure extending well up into the nostril. The bone also was cleft through its alveolar portion, the intermaxillary being twisted and protruded through the gap in the soft parts. This projecting mass was nipped through at the base, and the opposed surfaces of it and the superior maxillary having been pared, it was forced back and secured in its new bed by interosseous carbolised catgut sutures. The soft parts were then trimmed with the scissors, the cheek and nose required to be freely detached. The lip was unusually deep, and required three hare-lip pins, with a catgut suture at the red margin.

B. Here the cleft was also a deep one, but nearly free from osseous complication, a mere notch in the alveolar border on either side marking the abortive attempt at fissure. The soft parts were dealt with as in the previous cases, two needles being required. No other member of the family could be ascertained to have had hare-lip, though the left side of the nose of the mother was markedly flattened. In both cases collodion was applied at the time of the operation, together with suitable adhesive-plaster straps. In each the needles were removed on the fourth day, and very satisfactory results obtained.

*Amputation of the Leg.*—The patient, a woman, æt. 22, had been the subject of very long standing disease of the right tibia. Numerous cicatrices scattered over the entire length of the limb showed where many pieces of bone had exfoliated. Rather above the middle of the leg an ulcer of large size had remained persistent; through perforations therein the probe led down to an extensively diseased bone-surface. On different occasions local operative procedures were freely had recourse to ; each time such was followed by temporary relief, any repair, however, speedily breaking down again so soon as the limb began to be used. As the case ran on the general health became seriously impaired. The amputation, made as high up as it was possible to do below the knee, was effected by circular anterior and long posterior flap incisions. The vessels were all secured by carbolised catgut sutures. With the exception of slight reactionary hæmorrhage (from other weeping vessels—those secured by the catgut all remained staunched), which was promptly checked on the evening of the operation, progress at first seemed to be favourable. The catamenia, a week over at the time of the operation, appeared again five days after it, but only lasted for some hours. The succeeding night the patient was restless, and did not sleep well. In the morning her temperature registered 104°, with a pulse of 114 ; there was, moreover, tendency to sickness of stomach. The stump, which, heretofore, had looked well, and was in part healed, had now changed its appearance, and the middle of the posterior flap became pale and cold. The after condition of the patient varied much from visit to visit, but continued on the whole, notwithstanding occasional spells of hopeful-like promise, to be steadily downward. Sickness of stomach was so constant that life had to be sustained for several days by nutritive enemata. Both pulse and temperature varied much, but were usually very high. The central part of the posterior flap sloughed ; the soft parts receded and exposed the bone. The sloughs duly separated, and the wound cleaned. For a time, marked local improvement, together with constitutional amendment seemed to be fairly started, but this expectation proved delusive, and the patient sank on the eighteenth day after the amputation. An autopsy was not procurable.

During the period covered in the treatment of this case the weather was excessively cold and severe. Cases of anthrax, paronychia, and erysipelas presented with unwonted frequency in the extern department of the hospital ; still the hygienic state in the house remained satisfactory. Though some severe cases of erysipelas had unavoidably to be admitted, the affection, unless in a couple of very doubtful instances, did not spread, and wounded surfaces generally kept on doing well ; of five other recent limb amputations (two thighs and three legs) simultaneously under treatment with this case in the same service, three of them being in the same ward, and in closely adjacent beds to her, all continued to do well, and recovered satisfactorily.

*Sloughing Ulcer of Penis.—Repeated and Troublesome Hæmorrhages.*—The patient was a harness maker, æt. 26. The disease, situated at the root of the glans on the dorsum, spread very rapidly, and continued to close after the whole surface had been thoroughly treated on different occasions with nitric acid. The hæmorrhage was recurrent, free, and very difficult to control ; nearly the entire glans sloughed away. Part of the mucous membrane of the urethra escaped, and folding out on the healing surfaces, assisted materially to prevent contraction of the urethral orifice. The case had to be retained in hospital for thirty-five days ; during his stay a squamous eruption appeared, which readily yielded to subsequent treatment.

*Fracture of Skull (Two Cases).*

A. Of base, in a man, æt. 30, from falling down a flight of stairs ; there was severe bleeding from the back of the mouth, and from the right ear. The source of the former flw coould not be satisfactorily determined ; that from the ear became serous and subsequently purulent ; except for this, the patient appeared quite well when he took his discharge from the hospital fifteen days after the accident.

B. In a man, also æt. 30, who received a severe blow from a stone in the forehead, which drove in a piece of frontal bone the size of a florin, immediately above the nose. Through a wound in the integument the depressed bone could be distinctly felt by the finger ; this perforation gave vent to bubbles of air, when patient held his nose, and forcibly expired. The fracture was considered to extend above the limit of the sinus, and to implicate the skull proper ; however, there were no symptoms. After a stay in hospital of five days, the patient left, without permission, and has not since been heard of.

*Poisoned Wound necessitating Amputation of Finger.*—Three weeks before his admission to hospital, a man, æt. 50, was bitten by a pig in the ungual phalanx of the left middle finger ; diffuse inflammation of the digit and hand followed ; the proximal phalanx became necrosed. Disarticulation of the finger of the metacarpo-phalangeal joint was necessitated four weeks after the bite. Subsequent repair was very slow, the little wound not being healed for nearly seven weeks.

*Extensive Burn by Box of Matches.*—A drunken plumber fell asleep with a box of matches in his left breeches pocket ; ignition occurred and resulted in an extensive burn, involving upper and outer portions of the region of the thigh and leg. When the slough separated, there appeared to be one vast unbroken ulcer ; however, after some days further, very many specs of incipient cicatrisation showed, scattered freely over the surface, resembling to a nicety the appearance after successful skin-grafting. Owing, he alleged, to some urgent domestic trouble, the patient left the hospital whilst the wound was in this predicament, twenty-five days after the accident.

*Complicated Injury of Foot.*—A lad, æt. 3, run over by a float, smashing the outer toes, splitting the integuments of the entire foot in various directions, and tearing off

large portions of the skin; more than half the anterior portion of the sole sloughed, together with that of a considerable part of the dorsum and outer surface, including the smashed smaller toes. The wound healed in wonderfully. When the child left the hospital, sixty days after the accident, the parts had cicatrised, and the utility of the limb promised to be scarcely impaired.

*Severe Trismus—Recovery.*—A man, æt. 50, was admitted presenting an extremely well-marked instance of the affection. The trouble had existed for a week, but patient could give no account as to the cause; there was no history of injury or exposure. (The weather for some time previously had been exceptionally severe). The teeth were firmly clenched and incapable of the least separation. The sterno-mastoid and abdominal muscles were very tense. Pulse 78, temperature, 99° on admission. The treatment adopted consisted mainly in free administration of bromide of potash and chloral, together with tobacco stupes to abdomen. A nourishing fluid diet was also given. The progress of the case to recovery was most satisfactory. After a stay of little more than three weeks the patient was able to return home, feeling himself in the best of good health, and with perfect use of his jaws. The countenance, however, still bore the tetanic aspect in a marked degree.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, FEB. 28.

Dr. GREENHOW, President, in the Chair.

### Mr. THOMAS BRYANT

ON A CASE OF ACUTE INTESTINAL OBSTRUCTION—LAPAROTOMY—REMOVAL OF LARGE IMPACTED GALL-STONE FROM ILEUM—DEATH FROM PERITONITIS.

This case was one of a lady, who had been in good health until the day in question, having no symptoms of disease, except indigestion from time to time. On the 8th August she went to bed in health, and awoke at 12 o'clock with sickness and severe abdominal pains. She was thought to be suffering from a bilious attack, but the symptoms persisted. The attacks of pain became more and more frequent, and the vomit first foliaceous, then stercoraceous. During the exacerbations of pain she writhed in agony. The abdomen was everywhere tympanitic and tender, but the centre of distress seemed to be on the left of the umbilicus. The countenance was anxious, and pulse feeble; no external hernia. The diagnosis was that of acute intestinal obstruction, due to a band or twist or internal hernia; but there was no history to confirm any particular view. It being evident that death must ensue without surgical interference, laparotomy was proposed. *Operation:*—A downward incision, 4 inches long, was made in the central line of abdomen, commencing at umbilicus; blood-stained serum escaped, and small intestines were ecchymosed. The coils of intestine were followed, and a hard ovoid body was found impacted, or rather grasped, by the intestine. The body, which proved to be a gall-stone (exhibited before the Society), was removed; the wound in the intestine stitched with carbolised cat-gut, and the bowel returned. The patient never rallied from the collapse, but sank in eight hours. At the post-mortem examination no extravasation from the wound in the intestine had taken place. On the contrary, it was well sealed with lymph. There was advanced peritonitis. The point of impaction was the ileum, one foot above ileo-cæcal valve; the gall bladder was a thickened pouch, about the size of a walnut, and the duodenum was adherent to it, and their cavities continuous. The gall-stone removed weighed 238 grains, and measured 1¼ inch in length, 1⅛ inch in breadth, and 3¼ inches in circumference. Mr. Bryant remarked that the gall-stone must have made its way into the duodenum by ulceration, without any symptoms, more than could be attributed to indigestion. He commented upon the advisability of not delaying operative interference in cases of recognised intestinal obstruction, and mentioned that probably success did not follow the operation in question, because it was performed at too late a period; seventy-two hours of acute obstruction, together with mechanical injury from the passage of the calculus, giving rise to acute peritonitis, which rendered success almost impossible.

### Mr. RICHARD BARWELL

ON TWO CASES OF LUMBAR COLOTOMY.

John D., æt. 39, admitted in Charing Cross Hospital under the care of Dr. Silver, November 8, 1878; had always enjoyed very good health until last harvest, when he had frequent pricking pains in lower part of the abdomen, accompanied by constipation, which culminated in complete obstruction, nothing having passed by the bowel for nine days. The cause of this obstruction was obscure; a hardened mass above the left groin being very possibly either impacted fæces, a tumour, or a thickened bowel. Turpentine stupes, enemata, followed by frequent half-grain doses, seemed to act beneficially for about ten days; then obstruction again set in, and he rapidly became so ill that Mr. Barwell was called in consultation, and proposed immediate lumbar colotomy to relieve the inordinate distension of the bowel; but the man was much exhausted and blue to the finger-tips from difficulty of breathing. The operation was therefore rapidly performed, the colon opened, and a very large quantity of semi-fluid lumpy fæces evacuated. Although very greatly relieved, exhaustion continued; the system made an attempt to rally, but failed, and he died the next day at 5 p.m., about twenty-six hours after the operation. Post-mortem.—The stricture was caused by a ring-shaped epithelioma, about an inch broad, and in the thickest part half an inch thick, situated at the upper extremity of the sigmoid flexure. This was so tight that when the bowel was removed, and filled with water, none ran through. At the place of operation no sign of a wound or any inflammation was to be seen from the abdomenal aspect; the peritoneum having been untouched. Over a great part of the small intestine there was incipient peritonitis, chiefly evidenced by a slight stickiness of the surface. This was probably due to the distension to which the bowel had been subjected.

CASE II.—Leah C., æt. 32, came into Charing Cross Hospital 11th May, 1877, under the care of Mr. Barwell, suffering from almost complete obstruction of the bowels, which had been slowly coming on since a difficult confinement fifteen months ago, and which had been variously treated as habitual constipation and as piles. On digital examination of the rectum Mr. Barwell found that intestine almost occluded by a hard cancerous growth, through which a central opening barely admitted the tip of the finger. After a week of careful treatment the obstruction became more and more complete, and the abdomen greatly distended; and after consultation with his colleagues, Mr. Barwell opened the colon on the left loin. Three large washing basons full of feculent matter escaped; the woman was greatly relieved. A vulcanite plug was fitted at the end of a fortnight, and when she had learnt its use she went out of the hospital. All this time the cancer was invading more and more the pelvic viscera, and from reports brought by her husband it appeared that great bladder troubles, followed by complete incontinence of urine, set in. All the lower part of the body was an open sore, discharging largely, and she died exhausted three months after leaving the hospital—five months after the operation. Mr. Barwell remarked that these two cases were in many ways similar, but in the first such exhaustion had already set in that very litttle chance of effecting more than relief could be hoped for. In the second case nothing could be more marked than the relief afforded by the operation; had the stricture been caused by a remediable malady every chance of getting well was afforded by the operation; the obstruction was cured—the woman died of an incurable cancer. Mr. Barwell considered that an obstinate obstruction tending to threaten life is, after failure of one or two remedies, much more safely dealt with by the knife than by delay.

### Mr. EDWARD BELLAMY

ON A RARE FORM OF INTESTINAL OBSTRUCTION DUE TO INVAGINATION OF A PORTION OF THE SMALL INTESTINE IN THE WALLS OF THE RECTUM—GASTROTOMY—RECOVERY.

The patient was a pale, delicate-looking woman, æt. 34, of intemperate habits. She was admitted into the Charing Cross Hospital under my care on Feb. 15, 1879, with all the symptoms of intestinal obstruction. I ascertained that she had passed nothing per anum for nine days prior to admission. She had an inguinal rupture on the left side,

and had worn a truss, which was left off just prior to the present attack, and the hernial protrusion does not seem to have come down since. She had been subject to obstinate constipation, and on three occasions the retention of fæcal matter had given rise to very serious symptoms. These, however, have always been relieved by ordinary means. On her admission a hard swelling was to be felt in the left iliac fossa, in the region of the inguinal canal and sigmoid flexure. She had intense pain over the lower part of the abdomen, and her eructation smelt stercoraceous. I had her placed under the influence of an anæsthetic, and introduced my entire hand into the rectum, and found that I could not get my fingers past the upper part of the rectum, which seemed to be filled up by some protrusion into it, and which itself appeared to be constricted. I, however, determined to wait awhile before operating, and to give the patient all chance of treatment prior to doing so. She however rapidly became worse, the vomit becoming absolutely stercoraceous. I therefore on the evening of the 19th proceeded as follows, strict antiseptic precautions being adopted: I first made an incision down to the external ring, thinking that perhaps, from the history, there might be some implication in the canal. On passing my finger, however, into it, I found that this was not the case, but I found the sigmoid flexure greatly distended. I now enlarged my incision upwards and obliquely outwards, so far as to enable me to pass my entire hand within the abdominal cavity and feel for the constriction. Thinking it possible that the sigmoid flexure might have been constricted anteriorly by that fold of peritoneum extending from the posterior wall of the bladder and uterus, and *mesenterically* attached in front of the sacro-iliac synchondrosis (*the posterior utero-vesical fold*), I felt for it, and found it not only very much developed, but obscuring a knuckle of small intestine, which was obviously invaginated in the anterior aspect of the first part of the rectum, and in addition there were what appeared to be—I did not see, I only felt—bands of organised lymph, stretching across in the same place, and probably the result of some earlier inflammatory process in the locality. (The existence of these bands, and the hypertrophy of the peritoneal fold, will account for the non-reduction of the hernia per anum). I again introduced my entire right hand into the rectum, and pushed the prolapsed mass upwards and toward my left hand, which was in the pelvic cavity, at the same time breaking down the adhesions and gently drawing out the knuckle and small intestine from its invaginated position, and freeing it from the peritoneal fold. Very soon afterwards flatus was passed, and in a few hours a copious evacuation followed; of course, affording immense relief. I need not detain the Society by detailing the consequent conduct of the case beyond stating that she became very delirious on the fourth day, but the symptoms yielded to morphia and chloral. The wound was of course treated strictly in accordance with Lister's method, and she had absolutely no bad symptoms till Thursday, 26th, when she had some symptoms of peritonitis. In looking up the literature of the subject I am unable to find any case where gastrotomy has been performed for a similar condition, although Lockhart describes the form of hernia; but he states that he has never known operation necessary. It will be concluded, of course, that the cavity of the peritoneum was opened. This was unavoidable from the nature of the adhesions, and I made my examination from within its walls.

Mr. MARSH regretted the unfavourable ending of Mr. Bryant's case. No doubt this was an instance of an operation which was just too late. With reference to the propriety of abdominal section, he related two cases, in which Mr. Spencer Wells had stitched up the bowel, divided in the course of an ovariotomy, and had returned it into the peritoneal cavity with complete success. In one the bowel had been almost completely divided across. In the *London Medical Record* a remarkable case was lately noticed, where a gallipot had been removed from the intestine, into which it had been introduced by the patient. In a case of femoral hernia, resulting in an artificial anus, where obstruction had come on fron contraction of the orifice, Billroth had freed both ends of the intestine, and having fastened them together, returned the whole into the abdomen. He alluded to these cases to support his belief in the advisability of an early and a bold operation.

Mr. MAUNDER thought these cases should all be considered apart. In the first, he was afraid the operation was partly responsible for the fatal result. He himself was rather disinclined to making an opening in the abdomen. Three days' obstruction was not such a serious matter, as cases of external hernia would show. Besides cat-gut was a bad material to use. When peristalsis set in again the ligatures might probably soften and give way. Mr. Bellamy's appeared a remarkable and unique case, and he was to be congratulated on its successful treatment.

Mr. HOWSE thought two conditions of the abdomen should be recognised—one, where there was great distension; the other, where this state was not present. In the latter, a median incision seemed the best practice. In the former, which would often prove fatal, an opening in the groin was better, over the most distended part of the intestine. He could not agree as to the disadvantage of using cat-gut; he had used it in three or four cases of divided intestine with perfect success. He felt inclined to question the advisability of lumbar colotomy in cases where there was a clear diagnosis of cancer. It amounted to little more than prolonging the patient's misery for a few months. Where the obstruction depended upon large effusion of lymph or other, not in itself fatal, condition, no doubt the operation was necessary.

The PRESIDENT remarked that if he were so unfortunate as to have cancer of the intestine, he should certainly desire to have his life prolonged by operation, if even for a few months only. These were interesting cases, but he thought we had not heard much that was new as to the diagnosis of such cases; and he related a case where obstruction, depending on peritonitis, having lasted several days, gave way to belladonna, and was followed by recovery. The obstruction depended on pelvic cellulitis. Each case, in fact, must still be judged on its own merits.

Mr. BRYANT was surprised at Mr. Maunder's objection to the operation. The case had been dealt with as one of band or internal hernia, for its nature was only decided by the operation. He also believed that after 72 hours' strangulation in external hernia, death almost always ensued.

Mr. MAUNDER explained that part of his remarks.

Mr. BRYANT was also firmly convinced that the benefits of colotomy were unquestionable, and in his cases he had never met one who regretted the operation. Mr. Bellamy's was a very remarkable case, but he asked for some further explanation of its nature, which seemed difficult to realise.

Mr. BARWELL agreed with Dr. Greenhow on the necessity of operation in such cases as his. The surgeon had no right to deprive the patient of some months' life. His case had been intended to point out the importance of not waiting too long. He himself had met with a case of obstruction from gall stones; after some trouble he had extracted from the rectum with a spoon a stone as large as that shown by Mr. Bryant. He thought it probable that here the gall bladder had adhered to the transverse colon and ulcerated through.

DR. SILVER remarked that the diagnosis rested between a fæcal accumulation and a malignant growth as against the latter were the age and healthiness of the patient. In this case, as in others he had seen, he believed distension to be the cause of death from interference with the heart and lungs, and the post-mortem examination bore out this view.

Mr. BELLAMY allowed that the cause of this hernia was inexplicable, the anterior portion of the rectum had given way, the small intestine had got under the meso-rectum, and had then pushed forward under the mucous membrane.

Mr. GEO. LAWSON

ON A CASE OF SUCCESSFUL TRACHEOTOMY PERFORMED IN THE LATE STAGE OF DIPHTHERIA.

The patient, a little girl, æt. 8, was attacked with diphtheria on May 15th of last year, and was under the care of Mr. Morton, of St. John's Wood. The throat symptoms were those of well-marked diphtheria. Some hoarseness of the voice commenced on the 18th, but the diphtheritic throat symptoms seemed to have decidedly improved, and the child appeared to have taken the turn for the better. On May 20th, there was slight difficulty of breathing, and this gradually increased until the early morning of the 22nd, when Mr. Lawson was asked up to meet Mr. Morton and Mr. Dobell. The breathing was then loud and stridulous, her countenance dusky, and her face covered with perspiration; her finger-ends livid, and there was a distinct pitting above the sternum. As it was evident the child was rapidly sinking, it was decided to open the trachea. This Mr. Lawson did by the high operation,

opening the trachea above the thyroid gland. On making the incision into the trachea, a large piece of false membrane escaped by the wound. He introduced one of Durham's tracheotomy tubes, using only the single outer tube. The patient was then returned to her bed, which had no curtains, and the bed was drawn into the room away from the walls. The temperature of the room was kept as nearly at 65° as possible, but never warmer. A bronchitis kettle was placed on the fire, away from the bed, so as to moisten the air generally, but not to make it too hot or moist immediately around the patient. In the treatment afterwards, the tube was removed once, and sometimes twice, daily, as it was found that on each removal, false membrane and thick secretion was blown through the wound, which would not escape by the tracheotomy tube. The child progressed favourably. The tube was removed for good on the seventh day, and she ultimately completely recovered. Mr. Lawson stated that the points in the case to which he wished specially to refer were—1. The position of the tracheotomy. He said that an opening above the thyroid gland was more easily performed than below that body. The trachea in the upper region of the neck was more superficial, and the veins were smaller than lower down in the neck. The high operation was, therefore, a safer one for the patient, 2nd. By having only the one tube, there was a larger channel for the escape of the secretion, and it was more easily cleared. The danger of its becoming choked was, therefore, less. If it does get blocked, the removal of the tube will frequently allow viscid secretion to escape by the wound. In this patient the removal of the tube once or twice daily probably contributed materially to the successful results, as on each occasion during the first three days large masses of secretion escaped by the wound. There is no difficulty in replacing the tube, if the wound be first opened by Trousseau's tracheotomy forceps. 3rd. The having no tent or covering to the bed, and no steam close to the patient, to heat and moisten the air immediately round the bed. Mr. Lawson said he had long thought that the tent bed, with the pipe conveying steam close to the patient, a mistake; he, therefore, decided in this case to give the patient plenty of air, by having no curtains, and the bed away from the wall, and with the spout of the bronchitis kettle away from the child. In conclusion, he stated that he thought it only right to add that the success of the operation was in a great measure due to the judicious care and constant supervision which Mr. Morton kept over the patient, assisted by the intelligent nursing which the father and nurse bestowed on the child.

Mr. Pugin Thornton

ON A CASE OF SUCCESSFUL TRACHEOTOMY IN THE LAST STAGE OF DIPHTHERIA.

An outbreak of diphtheria occurred in St. John's Wood in the early part of September last. It was confined to a small radius, for, as far as can be gathered, only four houses were attacked. Each family was affected about the same time. This outbreak of diphtheria, for which no cause could be ascertained, followed the epidemic which gave so much anxiety during the summer months in the N. W. district, and concerning which Dr. Power has issued a most careful report. A. S., the subject of this paper, is a boy of three years of age. He was one of a family of three, the other two children having died before he was tracheotomised; their ages being respectively four and a quarter years and one year. This child was first taken ill on the 16th of September, the day after the eldest had died. At first he was taken with laryngeal symptoms, but these passing off, the tonsils were found to be covered with membrane. On the 27th, the 11th day of his illness, his larynx again became affected, and from that day to the first of October, his breathing progressively grew worse. It was at this date that I was asked to see the child, and on this day that I performed tracheotomy upon him. The youngest had died in the morning. At the time of the operation the boy was labouring under urgent dyspnœa, being extremely restless, with his face slightly livid. There was no albuminuria. For some days following the operation, pieces of membrane were coughed up through the mouth, or removed with forceps through the tracheal wound, and three weeks after, double strabismus set in, lasting for a fortnight. A further proof of the diphtheritic nature of the disease was, that I myself was seized on the fourth day from first seeing the case with a mild tonsillar form of the complaint, being kept in-doors about ten days. I had sat up the whole of the first night, and part of the two following nights with the child. The boy has since done well, and I think it may be called a successful case, although the progress of recovery has been very slow, for it is now five months, and the canula has still to be worn. During the day the tube is completely closed up with a cork, the child talking freely, and running about the house; but at night-time the cork has to be removed, for after he has been to sleep for a short time an attack of suffocation comes on, which can only be relieved by removal of the plug. The treatment throughout the case has been iron and chlorate of potash, and for the membrane a lactic acid spray was used. The other two children died with laryngeal symptoms, showing the family to be one of the unfortunate instances of fatal family susceptibility. I know of another family of three small children who, during the summer epidemic in St. John's Wood, all died with, I believe, laryngeal symptoms. My remarks have, of necessity, been few, as no notes of the case have been kept. Had it not been that Mr. Lawson was bringing forward a similar case, I should not have published it. I trust, at the same time, that its publication with Mr. Lawson's may help to strengthen all of us in the conviction that tracheotomy in diphtheria is somewhat a more hopeful procedure than many consider it to be; at any rate, an operation which should be more frequently carried out than I believe it is. Undoubtedly there are instances of children who must have succumbed in a few hours if left unoperated upon.

Mr. Maunder congratulated the readers on their success, for in his experience such results were rare in diphtheria. He had for some time doubted the necessity of a tube, and had occasionally tried to dispense with it.

Dr. Coupland related a case which showed the advantage of an early operation. The diagnosis of diphtheria was clear, there was exudation on the tonsils, and 1-3rd albumen in the urine. Mr. Morris operated, and the details were much like those in Mr. Lawson's case. Only the outer tube was used, and no tent was put up, nor was the steam directed over the bed. The case was doing well, and the bad symptoms disappearing.

Mr. Morris had little to add. The operation was the low one.

Mr. Barwell thought that perhaps the withdrawal of the membrane had a share in the successful result, but much depended upon the extent of the inflammation, and he mentioned a case in which he had recently operated, where, after death, the bronchi were found extensively blocked, though large quantities of membrane had been expelled.

Dr. Greenhow said that his experience of the result of tracheotomy in diphtheria had been very unfavourable, but part of the evil results he believed to be due to the shutting out of a free admission of air. In the statistics of Turner, from Edinburgh, and of Buchanan, from Glasgow, he had found many bad cases recover—such cases as he had seen die when treated with the tent, and with copious steaming. He could thoroughly agree with Mr. Lawson's suggestions, for he had made the same ten or twelve years ago in a paper which had appeared in the *Lancet*.

Dr. Duckworth thought the temperature in these cots ought not to be allowed to exceed 70°. This was a point he insisted upon strongly, because of the depression caused by higher temperatures.

Mr. Marsh said that ever since Sir Wm. Jenner had been at the Children's Hospital the tendency had been rather to do away with the steaming except in those dry cases which were occasionally seen. He had had some fifty cases of tracheotomy, with eight, or perhaps he ought to say nine, recoveries—a poor result, perhaps, but better than allowing all to die, as he believed they would have done, but for the operation.

Mr. Thornton, in replying, remarked that he had discontinued the use of a covered bed and direct steaming. He would add that the benefit of Mr. Baker's tube had been very evident in his case.

The meeting then adjourned.

## BRITISH DENTAL ASSOCIATION.

On Monday week, a large meeting of dentists was held at Willis's Rooms, for the purpose of receiving a report of the proceedings of the Dental Reform Committee, and forming a permanent representative Dental Association. Mr. John Tomes was in the chair.

Mr. J. S. TURNER, the honorary secretary, presented a report, explaining the circumstances attending the organisation of the Committee three years ago, and describing the efforts made by it to secure the passing of the Dentists' Act. The report also alluded to the indebtedness of the profession to Mr. Tomes for his great efforts in the cause. The Committee, it was stated, still had work before it, and if the same unanimity of purpose prevailed in the future as in the past, the results could not be doubtful.

The CHAIRMAN, after explaining the object of the meeting, gave a history of the agitation which led to the passing of the Dentists' Act, and referred to some of its principal provisions. The most valuable feature in the Act, he said, was the provision for the sufficient education of dentists, protecting the profession from the curse of incompetence. The next was the establishment of an official *Register* of *bona fide* practitioners, with a statement of their qualifications. Up to August next, any person might register on making a solemn declaration to the effect that he was in *bona fide* practice before July 22nd, 1878; but his name might be removed if the declaration should prove to be false. Unfortunately, there were no known means of preventing error or fraud. It would be the duty of those who knew of either to furnish such information as would lead to its correction. The Dental Committee of the Medical Council was the tribunal by which disputed cases would be investigated and decided. All initial registrations were, no doubt, the subject of abuse; but, after August, the door would be firmly closed to all but licentiates in dental surgery, and the unqualified would by degrees disappear from the list. The Chairman then expressed the obligations of the profession to several gentlemen who had rendered important service to the cause, especially the Honorary Secretary (Mr. Turner). He concluded by recommending that a representative association should be formed to watch over and protect the interests of the profession, on behalf of the public and of the profession itself. It would be better, he said, that such a body should inquire into alleged abuses of the law, rather than that it should be left for private individuals to bring them before the notice of the Medical Council.

Dr. W. H. WAITE, of Liverpool, proposed: "That this meeting desires to record its grateful sense of the valuable results achieved by the labours of the Dental Reform Committee; and, while declaring unabated confidence in the committee collectively, would pay a special tribute to the wisdom and assiduity displayed by the President, John Tomes, Esq., and the Secretary, James Smith Turner, Esq., throughout the arduous and difficult duties connected with the passing of the Dentists' Act; and this meeting further presents its best thanks to Mr. Tomes for the very admirable address he has just delivered." He expressed his grateful appreciation of the services of the Committee in rescuing the profession from its chaotic and almost hopeless condition, which, he said, might be fitly represented by Paddy's maxim, "Every man for myself." Dentists were now a legally recognised profession; and the public had a guarantee that, after a given date, no man should be at liberty to assume the functions of a dental surgeon until he had undergone such a training, and obtained such a certificate, as might fairly entitle him to public confidence.

The resolution was seconded by Dr. J. A. WALKER, and carried unanimously.

Mr. EDWIN SAUNDERS moved the following resolution, "That a society be now established, under the title of 'The British Dental Association,' whose objects shall be to watch over the interests of the profession with special reference to the proper carring out of the provisions of the Dentists' Act, 1878, and with full authority to organise special committees; the establishment of a Dental Benevolent Fund for the assistance of infirm and disabled members of the profession, to be supported by members' special subscriptions; and any other object that may appear desirable." Two conclusions must have been arrived at while listening to the admirable address from the chair: first that much care and watchfulness would be required to carry out the provisions of the Dentists' Act; and, secondly, that this duty, difficult and delicate as it might be, could not be confided to better hands than those of the Council of the Dental Reform Committee, to whose untiring labours the profession owed the possession of the Act.

Mr. H. BARRETT seconded the resolution. He said that, while the Act gave them vastly increased powers, it also brought to the surface many of those whose names had not been hitherto known to fame, and some known only to be avoided. He did not, however, believe that the respectable practitioner would suffer in his professional status; for the more they raised the position of the lower extreme, the higher opinion would the public form of the dental profession generally.

Mr. J. DENNANT supported the resolution. It had been stated that the dentists had by their movement voluntarily separated themselves from the medical profession. This could not possibly be so. They owed their authority to act to the Medical Council, and their education and qualification were given by the College of Surgeons of each of the three kingdoms.

The resolution was also supported by Mr. PARSONS SHAW, of Manchester, and unanimously agreed to.

Mr. RYMER moved: "That duly qualified practitioners entitled to be placed on the *Dental Register* alone be eligible to be enrolled in the Association; and that the Association be supported by annual subscriptions." He rejoiced that the portals of the profession were now open only to men of science and education, and he congratulated the meeting on the success of the labours of the Reform Committee.

Mr. UNDERWOOD, in seconding the motion, said that a work had been accomplished which twenty years ago would have appeared impossible of accomplishment in so short a space of time.

The resolution was unanimously adopted.

Mr. HILL proposed: "That the past and present members of the Executive Council of the Dental Reform Committee be, and hereby are, elected as a representative Board (with power to add to their number) to carry out the provisions of the foregoing resolution, with full powers of action." The meeting, he said, could not do better than elect as their representatives those who had brought them to their present happy position.

Mr. CAMPBELL, of Dundee seconded the resolution, which was unanimously agreed to.

Mr. COLEMAN proposed and Mr. TURNER seconded, a vote of thanks to the Chairman, which was carried by acclamation.

The CHAIRMAN, in acknowledging the vote of thanks, said that, in all such movements, somebody must be trusted, and the profession had trusted him. It now rested with the members of the profession to bring into working order the machinery provided by the Act. The meeting then separated.

# Department of Lunacy.

## "LUNACY LAW AMENDMENT."

THE reply of Mr. Secretary Cross to a question respecting an amendment of the Lunacy Acts, has cleared up many of the wild suggestions which have been bandied about as to supposed material alterations in our existing laws. It was to the effect that Mr. Cross would put himself in communication with the Commissioners in Lunacy on the matter. The very best answer that could possibly have been given. The Commissioners in Lunacy, having the entire supervision of all persons of unsound mind and the visitation of asylums and institutions for the insane,

are fully aware of the present working of the Lunacy Laws and of its shortcomings, so that we may now expect an amendment in clauses which will be beneficial to all those interested in the care and treatment of the insane, and which we trust will protect the proprietors and superintendents of asylums from a possibility of the base insinuations which have of late been so freely made against them. We hope some consideration will be given to the question of allowing persons addicted to intemperate habits to place themselves voluntarily under supervision in an asylum. Under the present existing state of the laws, for anyone to be received as a boarder in an asylum, he must have been previously a certified patient in an institution. We have carefully examined the Report issued by the Lunacy Committee who sat during last session, and we must confess we are unable to find any suggestions there worthy of the attention of the Commissioners with a view of amending the lunacy law. We are very glad that a Lunacy Committee was appointed, as it enabled society in general to find out that the allegations of discharged lunatics must be received with grave doubts and caution. Much time would have been saved if the Committee had examined the Commissioners and Government officials previous to their admitting the evidence of former inmates of asylums, which, to a certain extent, prejudiced some individuals. The accusations so made, and which were proved afterwards to be purely imaginary and delusive, naturally draw our attention to the fact that but little credibility should be given to the wild and exaggerated statements made by persons of unsound mind in courts of law. But it is to be regretted, however, that the public are too anxious to believe such *innuendos* without further investigation, and to condemn innocent persons who have been so unjustly attacked upon *ex parte* statements.

Royal Edinburgh Asylum for the Insane.—The annual general meeting of the managers of the Royal Edinburgh Asylum for the Insane, was held in the Edinburgh Council Chambers on 24th ult., Lord Provost Boyd in the chair. The treasurer's report showed the income for the past year to be £51,453, and the expenditure £57,833, thus leaving a balance against the corporation of £6,379. There had been an increase in the asylum debt of £16,000. The Lord Provost moved the adoption of the report, which was agreed to. Dr. T. S. Clouston, physician-superintendent, read his report for the year 1878, which stated that in the beginning of the year there were 733 patients in the asylum, and on the 31st of December the number was 790. There were 365 admitted, during the year, of whom 205 were men, and 160 women. The total number of patients under treatment was therefore 1,100. There were 242 patients discharged during the year, of whom 131 were men and 111 women. There were 63 deaths, of whom 32 were men and 31 women. The average number of patients resident during the year was 776, viz., 383 men and 393 women. The number of admissions during the year (365) was the greatest on record. It was 23 more than last year, and 72 more than the average of the previous ten years. The chief increase this year had taken place in the private patients, of whom 103 were admitted, against 84 last year; and many private cases at lower rates of board had to be refused for want of room. As regards the causes of the disease, the tables for this year showed nothing very special. There was the usual wretched tale of 51 patients (14 per cent.) where excess in drinking was assigned as the direct cause of the malady, but that was about the usual proportion. He really could not discover that the commercial distress and the hard times had influenced the number or the kind of cases in any respect, except possibly this, that the cases labouring under depression of mind were never so large in absolute number (115), or in proportion, 32 per cent. of the whole. One most sad and painful case, that of a person driven into melancholia by losses indirectly connected with the City of Glasgow Bank, was now by far the most suicidal person they had, requiring most vigilant watching by night and day to prevent the committal of self-destruction. A glance at the statistics of causation showed that out of the 274 cases in which any cause was assigned, only 101, or 37 per cent., resulted from causes that could by any possibility be said to have been under the control of the patient—After filling up the vacancies in the list of managers, and passing a vote of thanks to those retiring, the meeting separated.

Action of Strychnia and Brucia on Cerebral System.—Dr. Klapp, of Philadelphia, has published some interesting facts relating to the action of strychnia on the cerebral system. The theory that strychnia given in toxic doses fails to affect the motor nerves is promulgated. In thirty-seven experiments made on animals he found that this drug did not destroy neurility. Dr. Robins, of the same town, acting on the suggestion of Dr. Klapp, instituted a series of experiments with brucia on the motor nerves. The solution for making these investigations was prepared as follows:—In each cubic centimetre of distilled water there was dissolved one-hundredth of a gramme of brucia, and the solution neutralized with a drop of acetic acid, and a Grove's battery used to imitate the nerves. We give three of the experiments as arrived at by Dr. Robins.

1. Rabbit; weight, 3 pounds. At 1.20, ½ cubic centimetre of the brucia solution was injected. At 1.26.5 strong tetanic convulsions, with great dilation of the pupil; at 1.29.6, cessation of convulsions, which occurred again at 1.30.16, induced by touching, and lasted until 1.31.3, when the tetanus relaxed and the animal was found to be dead. At 1.40 the left and right sciatic nerves were bared and tested with battery at O, alternately, until 2.10, without response, while muscular response was elicited at each application.

2. Dog; weight, 28 pounds. At 2.14, ¾ cubic centimetre of the solution injected. At 2.16.30, uneasiness, whining, pupils much dilated; at 2.19, strong convulsions, great injection of the conjunctivæ; at 2.21, cessation of convulsions, stiffening of body, slight twitching of facial muscles, voiding of urine and fæces, marked by continued nystagmus; at 2.28.30, cessation of convulsions, twitching of the facial muscles, and peculiar snapping of jaws; at 2.25, cessation of respiration, and at 2.56, cessation of heart's action; 3.10.5, battery at O applied to gluteal muscles gives satisfactory response, but none obtained from right or left sciatic; and at 3.14 and 3.18 re-applied with same results. (Post-mortem examination showed great congestion of the brain, heart stopped in diastole, with both ventricles full of liquid blood.)

3. Rabbit; weight, 2½ pounds. At 10.54, ¾ cubic centimetre of the solution was injected. At 10.55, uneasiness and convulsive facial movements; at 10.56, tetanic convulsions of great violence, followed by death at 10.59. At 11.06, 11.10, and 11.15, the battery was applied to right and left sciatic nerves and gluteal muscles, with responses from the latter, but none from the former.

Cysticerci in the Brain Diagnosticated during Life.—A case of this character is recorded by Dr. Joseph Pollak in the *Wiener Med. Presse*, No. 47, 1878. The patient was a boy, 8 years of age. Examination of the pulse, temperature, thoracic and abdominal viscera failed to reveal anything abnormal. The boy complained of excruciating headache, and his piercing cries were loud enough to be heard at quite a distance. Very shortly after his first visit the attendant was recalled, when he found the pupils dilated, the urine and fæces passed involuntarily, and the abdomen distended; headache was

still severe. Every few hours attacks of an epileptiform nature recurred, while in the intervals there was a remarkable absence of all these symptoms. At one of his visits, just after prescribing a cathartic, he had occasion to examine the stools, where he found portions of a tænia. The presence of this, in connection with the other symptoms, at once aroused the suspicion that he had here a case of entozoal origin. At his next visit, he found the patient comatose, and on examining his pupils found to his surprise what proved on closer examination to be a cysticercus in the anterior chamber. He at once pronounced the case one of cysticercus of the brain. The patient died shortly afterwards, and the diagnosis was fully verified.

THE REV. MR. DODWELL.—The answer given by the Home Secretary to Mr. Cowen in the House the other evening in reference to the above case will scarcely satisfy the public, who desire to be informed of the nature of the facts on which it is considered advisable to detain this unfortunate prisoner as a dangerous lunatic. What are his delusions? and, Why were not medical witnesses called to give evidence as to his mental state at the time of the trial?

SPIRITUALISTIC MADNESS.—It has been stated by one of our contemporaries in reply to a question as to the number of persons of unsound mind in America, driven so by spiritualism, that only four can be traced. This statement is quite contrary to the information we have received from the United States on the subject. We read in an article contained in the *Journal of Psychological Medicine* for 1856, entitled "on Moral and Criminal Epidemics," that the spirit faith in America is computed to embrace 2,000,000 of believers, and hundreds of thousands in other lands, with 20,000 mediums. It appears that these include men in all ranks of society, from the highest to the lowest. Many of the facts related, imperatively demand that we should consider this as a *delusion*, not altogether an *imposture*, especially the consideration of the number who have gone insane on the subject. It is said that amongst the lunatics confined in public asylums in the United States, *there are* 7,520 *who have* become such *entirely owing* to this "spirit faith." We have also received correspondence from America on the subject, in which we have been credibly informed of the large number of insane spiritualists at the present time confined as *non compos mentis* in the institutions of the United States.

LAST week the rates of mortality per 1,000 of the population of the principal cities and large towns were :—Plymouth 18, Brighton 18, Bristol 19, Portsmouth 20, Sunderland 21, Edinburgh 23, Norwich 25, Newcastle-on-Tyne 25, London 26, Birmingham 26, Bradford 26, Hull 26, Sheffield 27, Nottingham 27, Wolverhampton 28, Oldham 28, Glasgow 29, Salford 29, Leeds 31, Leicester 32, Liverpool 34, Manchester 34, and the highest rate Dublin 43.

THE rates of mortality in the principal foreign cities, according to the most recent weekly returns were in Calcutta 40, Bombay 27, Madras 43; Paris 27; Geneva 26; Brussels 28; Amsterdam 26; Rotterdam 36; The Hague 27; Copenhagen 24; Stockholm 20; Christiania 20; St. Petersburgh 48; Berlin 25, Hamburg 24, Dresden 22, Breslau 34, Munich 33; Vienna 31, Buda-Pesth 39; Rome 35, Turin 34, Venice 30; Alexandria 39; New York 30, Brooklyn 24, Philadelphia 20, and Baltimore 19 per 1,000. The rate of mortality in St. Petersburgh averaged 47·5 per 1,000 during the first seven weeks of this year, against 36·3 in the last quarter of 1878.

WEDNESDAY, MARCH 12, 1879.

## THE MEDICAL ACTS (1858) AMENDMENT BILLS, 1879.

THE DUKE OF RICHMOND'S BILL, introduced by him as Lord President of the Council, on behalf of the Government, provides for—

1. REGISTRATION OF MEDICAL PRACTITIONERS.—The following persons are to be registered :—

*a.* A person who has obtained, *before January, 1st*, 1880, any *single* qualification which is now registrable (sec. 35).

*b.* A person who, in the interval *between January 1st*, 1880, *and* "*the commencement* of a joint board system," has obtained *a double* qualification.

*c.* A person, who, *after the commencement* of a joint board system, has passed the examination of such board, and attached himself, by diploma, to one or other of the co-operating medical authorities (sec. 6).

*d.* A person (? woman) who has passed a conjoint examination, but has been *refused* (sec. 5) a diploma by the licensing bodies.

*e.* A person holding an honorary degree (sec. 10, sub sec. 7), and a colonial or foreign practitioner (secs. 7 and 8), to be referred to hereafter.

The method of registration is—

*a.* By the licentiate sending his diploma to the Medical Registrar (sec. 6).

*b.* By the licensing body sending to the Medical Registrar a list of those to whom it has granted diplomas (sec. 18, lines 21 to 30).

The Bill also provides for keeping of general and local registers, and for the removal and restoration of names, &c., &c., &c. (secs. 10 to 14).

"The registration fee—is such fee not exceeding £5," as the medical council shall fix.

EXAMINATION RULES UNDER WHICH THE CONJOINT EXAMINING BOARD IS TO ACT.—"The medical authorities of each part of the United Kingdom (or the examining board when empowered by them) shall frame rules for regulating the examination, determining the subjects and the standards for passing, and the methods of conducting the same."

These rules shall be "subject to the approval of the General Medical Council" (sec. 15, sub-sec. 1, line 5), but the Council is not authorised to interfere directly unless (*a*) the medical authorities fail to make a scheme within due time (sub-sec. 5), or (*b*) the rules require revision (sub-secs. 6 and 7).

FORMATION OF CONJOINT EXAMINING BOARDS.—"The medical authorities of each part of the United Kingdom shall, as soon as may be, form a medical board for the holding of examinations," in accordance with rules above referred to (sec. 16). The scheme for that board is to be "with the sanction of the General Medical Council," and "may" be submitted to the Privy Council for confirmation.

The function of the board is, "from time to time, to hold examinations according to the * * examination rules in force * * in such "manner and at such places and times as they (the board) think expedient," and to grant to each examinee a certificate "that such person has shown, by examination, that he is qualified to practise medicine and surgery, including therein midwifery."

Any conjoint board scheme (*i.e.*, that already agreed upon for England) which is complete at the passing of the Act is confirmed (sec. 16, line 6, *et seq*), and, *ipso facto*, becomes law.

"If after the commencement of the joint board system" any division of the kingdom is without a board, "either for want of a scheme or otherwise howsoever," the Medical Council *shall* make a board, subject to Privy's Council's approval (sec. 16, line 17). If the board or any of its members at any time fails "in duty," by not complying "with the examination rules" set down for its guidance, or "by not conducting the examinations in a satisfactory manner," or by refusing information to the Medical Council, any or all of its members may be "dismissed," either by the co-operating bodies or by the Medical Council.

OTHER MATTERS DEALT WITH IN CONJOINT SCHEME.—The scheme "may also provide for the relations between the examining board and other boards, and the fees to be paid on admission to examination." Also "for paying out of said fees, the expenses of examination and of carrying into effect the scheme, and for applying the surplus towards the support of such museums or libraries under the control of any of the medical authorities, or of such public object as the General Medical Council consider to be of so great importance to the promotion of increased knowledge in medicine or surgery as to merit that support."

POWERS AND RIGHTS OF INDIVIDUAL LICENSING BODIES.—Every licensing body is free, notwithstanding its charters, statutes, or bye-laws, to carry the Act into effect, and may for this purpose, "by a statute or bye-law made with the approval of the Privy Council," repeal anything "which appears to be inconsistent with this Act" (sec. 23).

Every licensing body may "constitute a new diploma to be granted by them for the purpose of attaching to such authority, with a view to registration, persons who have obtained qualifying certificates under this Act" (sec 21). Any power given, and anything authorised to be done by the medical authorities of any one part of the United Kingdom may, in the case of Ireland, be done by not less than four of such medical authorities" (sec. 20).

Appeal by an examining board, or by any licensing body, against the rules, whether those rules be made by the co-operating bodies, or the examining board, or the Medical Council, lies to the Privy Council (sec. 15, sub-sec. 9, line 25).

FEES FOR ADMISSION TO EXAMINATION are to be regulated by the conjoint scheme. (Sec. 19, page 12, line 3.) But there is nothing in the Act to show when those fees are to be paid, or whether they are to be of the full amounts to include the diploma, or are only to be the mere expenses of the examination. It is not set forth whether the whole fee is payable previous to conjoint examination, and the diploma then given to the student *gratis* on demand, or whether a small fee only is payable on examination, and the licensing body then left to charge for its diploma as it pleases. The English conjoint scheme (which is confirmed by sec. 16, page 10, line 3) provides for the payment of "not less than 30 guineas, to be paid in two or more payments." (Section 9 of English scheme, 1st May, 1877.)

The appropriation of the money is set forth in sec. 19, page 12, line 5. See under "Formation of Conjoint Board" above.

UNIFORMITY OF EXAMINATION, CURRICULUM AND FEE.—There is no provision whatever in the Bill for such uniformity, the preamble of section 13 in the Bill of 1878 being struck out in the present Bill—that preamble stated that "the General Medical Council has certain duties as regards the superintendence of examinations * * and it is expedient to give to that Council powers for the performance of the like duties in the case of medical boards *in order that the qualifying certificate may be granted on like terms in all cases.*"

The Lord President's Bill of this year differs from that of 1878, in that it places the making of examination rules in the hands of the medical authorities, instead of the General Medical Council, who were invested with it last year. By the present Bill the duty of making such rules is given to the medical authorities of each division of the Kingdom, with the sanction of the General Medical Council, but the Council is only authorised to interfere actively in case the medical authorities have not provided a scheme of conjoint examination before the 31st of December, 1880.

By the Bill of 1878 the medical authorities had no voice in the making of these rules until the rules had been submitted to the Privy Council for confirmation, when a copy of them was to be sent to each licensing body, and it was then open to them to object. ('78 Bill—sec. 13, sub-sec. 5.) By the present Bill—on the contrary—the rules made by the authorities are "subject to the approval of the General Medical Council," whose function is confined to confirming them if not absolutely objectionable. This change in the Bill was made in accordance with the suggestions made last year by the conference of representatives of the London bodies, and our own College, and the College of Physicians. The Bill of Messrs. Mills and Childers confides the making of the rules to the Medical Council.

It is to be hoped, with a view to establishing conjoint examination in Ireland, that the licensing bodies can be brought to agree upon a scheme. It is almost certain that the Queen's University will refuse to co-operate, but, under sec. 20, "Anything authorised * * to be done by the medical authorities of any one part of the kingdom may, in the case of Ireland, be done by not less than four of such medical authorities."

This section is ambiguous, for it does not appear from it whether it is meant that four conjoining bodies can compel the fifth to co-operate, or whether, on the other hand, the four can carry out conjoint examination under the Bill, leaving the fifth to its own course. If the latter be the true interpretation of the section, then the recalcitrant

body might continue to grant its diplomas on any terms it pleased, but under sec. 5 those diplomas could not be registered, and would be useless for most purposes. It may be that even four of the Irish licensing bodies will not be found willing to compromise their difference of opinion. But if four of the licensing bodies do not conjoin, then the General Medical Council "shall forthwith" frame the examination rules.

It is quite open to doubt whether the Irish Colleges would not fare better if the making of the rules were left to the Medical Council, for that body has already adopted the English conjoint scheme, and that scheme is made law by sec. 16 of the Bill; and it is most probable that a scheme for Ireland or Scotland would be constructed upon the same lines, and that scheme provides for a sufficient fee and curriculum—points which the Irish colleges are especially anxious to secure. In fact, the propriety of leaving to the medical authorities of each division of the kingdom the construction of their own examination rules was urged upon the Government, because the Bill of 1878 contained provisions to secure uniformity of the conjoint examination arrangements throughout the kingdom; and it was felt that the Irish School of Surgery was safe if all bodies were made to conform to the English scheme; but the present Bill contains no such guarantee of uniformity, and it seems to us that the Irish bodies will find it hard to make a good scheme if left in a position of downward competition with the Scotch bodies.

This is the point to which attention must be most earnestly directed, *i.e.*, the omission from the Bill of any proviso whatever to secure uniformity in the conjoint examination arrangements throughout the kingdom. This uniformity, to secure which has always been admitted to be the chief object of medical legislation, was recognised as a necessity by the Marquis of Ripon's Bill, of 1871, which imposes upon the Medical Council the duty of making arrangements "securing the equally strict application of the rules, so that a license under this Act may be granted on the like terms throughout the whole of the United Kingdom." This phrase will be adopted this year in the Bill of the British Medical Association, and in the Lord President's Bill of 1878 the duty was, as stated above, imposed upon the Medical Council to see "the qualifying certificate shall be granted on like terms in all cases." Thus the Scotch licensing bodies are left to do as they please in the matter of curriculum and fee, subject only to the sanction of the Medical Council.

It is almost needless to point out that, not only would the Bill be useless to the profession, but that it would be most injurious to the cause of medical education, if it passed without any guarantee for uniformity of conjoint examination arrangements. How could the Irish co-operating bodies proceed to fix upon a sufficient curriculum of study, a comprehensive examination, or a fee adequate for their own maintenance, if they were obliged to act in apprehension of being underbid in all those respects by the Scotch Colleges? And of what advantage would it be to the profession to reduce the competing diploma-giving bodies to three, if the competition between these three was perpetuated in a still worse form than before. There can, we fear, be no doubt that the words which provide for uniformity in these matters have been designedly omitted, and we are strongly of opinion that the Irish College will be called upon to put forth every effort, both in their own interest and that of the profession, to have them restored, in which, no doubt, they will receive the help of the British Medical Association.

The danger of depending upon "the sanction" of the General Medical Council to protect Ireland from a ruinous competition with the Scotch bodies is enhanced by the fact that the Scotch representatives are very active and influential in the Council, and that under section 27 of the Bill, it is open to the Council to delegate to any branch—any medical "board or boards, medical authority or authorities, or to any person or persons consenting thereto—the duty of framing any examination rules, or of framing any scheme for the purposes of the Act." Under this proviso the settling of curriculum, fee, and examination, might (in case the now licensing bodies could not agree together) fall into the hands of a sub-committee of the Medical Council, in which the Scotch representatives would be all powerful.

*(To be continued.*

## PROFESSOR OWEN AND THE ANTI-VIVISECTIONISTS.

THE observations which Professor Owen recently made on vivisection, appear to have given great offence in certain quarters. The remarks which particularly aroused the indignation of the anti-vivisectionists, were those in which the Professor spoke of them as mere "blatant humanitarians," who "cheaply flaunt before the world in Pharisaical fashion, their humanitarian phylacteries prohibitory to vivisection!" This was certainly a hard hit at the anti-vivisectionists, but not more so than many of them deserve. We do not, for a moment, doubt that there are among them persons who hold very temperate views on the subject, who conscientiously believe that they are engaged in wiping out a great blot upon our modern civilisation, who have no wish to magnify the evil of which they complain, and who are rather misled than misleading. But these people are an exception and not the rule. The great majority are little better than Pharisaical humanitarians, whose over zealous conduct, and dishonest representations of the practice of vivisection, cannot fail to strike the impartial observer. We, by no means wish to say that the humanity of those who perform experiments on living animals is immaculate. There are, we verily believe, physiologists, who are more remarkable for their scientific zeal than for their benevolence towards the lower animals. We all admit that the outcome of a large number of vivisections is, as regards their practical benefit to mankind, out of all proportion to the time and labour spent upon them, and the cruelty to which they have often given rise. We will even go so far as to say that, in some instances, physiological experiment on the living animal may, from a scientific standpoint, have done more harm than good, by laying the foundation for erroneous doctrines and practices. But when we have said this, we have said all that can be legitimately adduced against the practice of vivisection. We have said that which might justify the authorities

in seeing that the practice was not abused, but nothing that would justify them in putting a stop to it altogether. The history of the present movement shows well the prejudice, the party spirit, the ignorance and the animosity, which this agitation has involved. A few individuals, seized with a sudden spasm of inordinate affection for the lower animals, are appalled at the experiments which a physiologist has here and there performed, and at the cruelties to which, in their morbid imaginations, such experiments must have given rise. Immediately they resolve to preach a crusade with all the fervour of a Peter the Hermit, or an Ignatius Loyola. They adopt all the means in their power to make the public share their prejudices. They get up a society with the avowed object of creating a "public opinion" in their favour, and of "imparting to all classes a correct (?) notion of the evil and its effects." They form an "association," and enlist the sympathies of that very impressible class of people, clergymen and young spinsters. They establish a journal devoted entirely to the consideration of their pet subject. They petition Parliament. They send young ladies round to every householder to acquaint him with the abominations around him, and to get him to sign their "petitions." They exaggerate the evil they complain of with an effrontery which even their fanaticism barely excuses. They post up placards, and distribute broadcast pamphlets and leaflets, by which the public are led to believe that the most revolting cruelties are practised by gentlemen, physicians, and physiologists. The consequence is that they have succeeded in getting up a sort of factitious public opinion on the subject, and in raising such an agitation that Parliament has been obliged to do something to appease their clamour. This, however, is not enough. Nothing less than the total abolition of vivisection will satisfy them.

Now we fail to see by what argument it can be shown that because a practice (which was always confined to a few intelligent observers) is liable to abuse, that therefore it should be entirely abolished. We can conceive why betting offices and gambling houses have been suppressed, and why cock-fighting and prize-fights have been rendered illegal. They were establishments open to the general public, or brutalising exhibitions and practices which had a tendency to demoralise the whole community. But why a method of scientific investigation, which was pursued by only a few practical physiologists—which was in ninety-nine cases out of a hundred, practised while the animal was under the influence of anæsthetics—which had for its object, not the amusement or the aggrandisement of the parties concerned, but the advancement of a science that has already done so much in relieving human suffering and prolonging human life—which involved so much time and labour and special knowledge, that it never could be practised to any great extent—and which, moreover, was confined to the laboratory, away from the public gaze; that such a practice should have caused so great an explosion of public indignation, will, in our opinion, ever be thought one of the most curious social events of the nineteenth century.

We believe it is the intention of the anti-vivisectionists to introduce a Bill for the total abolition of vivisection into the House of Lords. Their organ, the *Anti-Vivisectionist*, observes that there is "no chance of this Bill passing, nor is it at all desirable that, in the present uninformed state of the public mind on the subject, legislation should take place As yet, there is no weight of public opinion to counterbalance the authority of such men as Professor Owen and others." This is as much as saying that, notwithstanding all the tricks and artifices that have been resorted to, the public have not been yet goaded into such a furore of indignation as would suffice to force the Government into fresh legislation on the subject. The "present uninformed state of the public mind!" We should think that by this time the public must be heartily sick of the subject, and would feel some relief if a gag could be put into the mouth of every "blatant humanitarian." Had it not been for their fanatical officiousness and audacious misrepresentations, there would not have been any public opinion at all on this subject, as the evil complained of was of too trifling and questionable a nature to have much "weight" with the general public.

Did our space permit of it we should like to ask on what grounds the "total abolition of vivisection" could be defended. No one, unless under the influence of the most fanatical prejudices, could go so far as to deny that many circumstances might occur in which experiments on the living animal, and even vivisection, would be perfectly justifiable. No one could contend that it would be wanton cruelty to test the action of some new powerful drug, or the effect of some new operation, upon an animal, before administering the drug to, or performing the operation upon, a human being. Such a contention would involve greater inhumanity than could be laid to the charge of the vivisectors, inasmuch as it would be greater cruelty to jeopardise the life of a human being than to kill one of the lower animals.

We would, however, in conclusion, advise those who have a licence to perform these experiments, to take care not to abuse the privilege they enjoy, and to give as little offence as possible to a class of people who will be sure to make the most of any little incident that may tell in favour of the cause they have so much at heart. We must confess that if Professor Owen and others have given some severe castigations to these intemperate humanitarians, the latter have often retaliated in no contemptible manner. They have on several occasions found out the weak points of our armour, and have as frequently made good use of their discovery. When eminent physiologists admit that the outcome of many past vivisections have been error and not the truth, and when other eminent physiologists draw from their investigations as to the actions of well-known drugs upon healthy animals inferences that cannot be applicable to the case of diseased human beings, we must not be surprised if the anti-vivisectionists find in our own camp fresh weapons wherewith they can not only assail us, but hope at last to gain an easy victory. That this victory, were it gained, will be a lasting one, we do not for a moment suppose. The wave of ultra-humanitarianism that is now disturbing the equilibrium of public opinion in this country, will doubtless before long find its proper level, and posterity may perhaps look back with astonishment to the age which witnessed men butchering each other in various quarters of the globe, while others were crying over the imaginary cruelties inflicted upon puppy-dogs and rabbits.

# Notes on Current Topics.

## Kew Gardens.

A FEW nights ago, in the House of Commons, Sir Trevor Lawrence renewed his motion for the early opening of Kew Gardens for the public, but he was defeated, on a division, by 196 to 94. We regret that he did not meet with more success, for, as we stated last year, there are many good reasons why more facilities should be given to the public to make use of these gardens either for recreation or study. It is, however, no good discussing, as we did on a former occasion, the merits of the question, as the authorities are likely to have their own way for a long time to come. Those who opposed Sir Trevor Lawrence's motion did not bring forward any stronger arguments in favour of maintaining the present state of things than that the proposed change would not only interfere with these purely scientific pursuits, for which, it was said, the gardens were primarily established, but would also play into the hands of local speculators and landed proprietors. It cannot, however, be shown that the free opening of the gardens would interfere with the pursuit of botanical science, or that there is much science to be interfered with. The gardens were established for other purposes than that of "being the admiration of the world." But instead of being used as a means of diffusing among the public a taste for botanical study, they are, in this respect, chiefly subservient to the studies and researches of a few professed botanists. If, on some future occasion, the question is again raised, we would suggest that the contending parties come to some compromise. If the gardens were freely open to the public on two days of the week, it would be meeting the wishes of a large section of the community, especially of those who reside at a great distance from the gardens, and who have not the opportunity of making frequent visits in the afternoons. Such an arrangement would not be open to the objections that have been raised to the early opening of the gardens every day of the week.

## Metropolitan Hospital Sunday Fund.

AT a meeting of the General Purposes Committee of the Hospital Sunday Fund, held at the Mansion House last week, Sir Sydney Waterlow in the chair, the question of furnishing a return for the use of the members of Council of the particulars connected with each hospital and dispensary, and upon which the awards of the Distribution Committee are founded, was fully discussed. Sir Rutherford Alcock contended that there could be no valid reason urged for the continuance of treating the returns as "private and confidential," since the information afforded was in all cases the basis of the published report of the hospital issued at stated periods to the subscribers or governors; and that the information afforded, if properly tabulated, would be of essential service to those interested in the good management of such institutions; and for managing committees, a means of comparison and checking many important items of expenditure which could be brought together in no other way. The Chairman suggested that they should leave out the arithmetical basis and the basis upon which the awards were made, as likely to cause difficulty and confusion owing to the fact that it would not at all times be convenient to give reasons why two awards differed. Eventually, upon the motion of Professor Marks, it was resolved, "That in the opinion of this Committee it is desirable that a certain portion of the information on the returns made to the Distribution Committee should be tabulated for the use of the Council, and that it be referred to a special committee of seven members to consider the form in which it should appear, and report the same to the next meeting." The Earl of Aberdeen has accepted the seat on the Council which became vacant by the death of Earl Russell.

## The Medical Society of London.

THE dinner of this Society, in commemoration of the 106th Session, was held at the Criterion Restaurant on the 8th inst., Professor Erasmus Wilson, F.R.S., President, in the chair. After the usual loyal and patriotic toasts had been given, those of the learned Societies, the Medical Corporations, the President Elect, the Medical Society of London, the President, and the officers of the Society, were duly proposed and responded to by Dr. Braxton Hicks, Mr. Erichsen, Dr. Bucknill, Dr. Cockle, Prof. Erasmus Wilson, Dr. Richardson, and Mr. Harrison. The medals of the Society were presented to Mr. J. Astley Bloxam, F.R.C.S., and Dr. C. T. Williams, by Professor Erasmus Wilson, in a very appropriate speech, for their valuable services as Secretary and Librarian to the Society, to which these gentlemen replied. The musical arrangements were under the direction of Dr. L. S. Forbes Winslow and Mr. H. De Meric, and appeared to give universal satisfaction, and added to the enjoyment of a very pleasant evening. About 150 sat down to a well-served dinner, and the company did not separate until a late hour.

## An Irish Dispensary Election.

THE proceedings of an Irish dispensary committee in the recent election of a medical officer brings under notice two points deserving of consideration. The election itself was nothing more than an example of the usual religious squabbles which stand in Ireland in lieu of the selection of a competent attendant for the sick poor. One candidate was an M.D. of the Queen's University, the other, an M.B. of the University of Dublin; and this apparent difference in qualification was used with great emphasis as a reason for selecting the M.D.Q.U.I. as holding a higher qualification than the M.B. T.C.D. We need hardly inform our readers that the M.B. of the University of Dublin—if it be presumed to be no higher than the M. D. Q. U. I. as a guarantee of medical quality — is admittedly superior as an evidence of education, inasmuch as it requires four years' study and a full academic course to obtain it. We confess that we fail to comprehend the inaction of the authorities of Trinity College, who have seen their highest medical degrees superseded by a nominal M.D., which is not a university degree at all in the fair sense of the term, and which can be readily obtained with a little more than half the labour, and half the time, and at a

fourth of the cost, of the Dublin University doctorate. It is hardly probable that students will continue to pay so high a toll in labour, time, and money for the M.D. of Dublin University—a distinction, the real value of which is only known to a few of the initiated, and which, with an uneducated community like a dispensary committee, ranks even lower than the cheaper and easier degree.

The fortunate (?) candidate for this dispensary having been chosen by his friends, was subjected to a catechism as to his contemplated fees, being threatened that, if he did not accept shillings instead of pounds, the whole population of the district would be put upon him gratis.

Committeeman No. 1 was of opinion that if the doctors charged low fees they would find their practice more remunerative than it was. In France the most distinguished doctors never charged more than 5 francs a visit, and they make princely incomes. When he was recently laid up there the most celebrated doctor in the district paid him nineteen several visits at five francs each.

No. 2.—I may remark that the usual fee in the North of England is 2s. 6d.

The newly chosen medical officer said he would be quite happy to meet the views of the Dispensary Committee on that point. *He would only charge 5s. for a consultation at his house, and 10s. if he had to visit any person.*

Committeeman No. 3 impressed upon him the absolute necessity, whenever he attended a case of any danger, to have the clergyman of the persuasion of the patient immediately sent for.

The medical officer replied that he was fully alive to the absolute importance of so doing on every occasion of danger.

Catechising a medical officer in this way is a piece of official impertinence, and that gentleman would have shown more respect for himself and his profession if he had refused to listen to dictation which committeemen have no right whatever to offer, and had declined to give any pledge such as that required of him. If it pleases a practitioner to accept 5s. consultation fees, he is quite at liberty to do so, and is answerable in so doing only to the college from which he had his degrees, and whose honour and dignity he is bound to uphold. We don't even say that it is contrary to professional etiquette to do so, but committeemen have no more right to dictate to him on such a matter than to insist on his parting his hair down the middle. Subservience to such dictation is the parent of official arrogance, and however necessary it may be to carry one's hat in hand during a village canvass, it is neither necessary or wise to carry that humiliating process into professional life.

## The Meeting of the General Medical Council

For the purpose of considering the reform of its own constitution has been summoned for Tuesday, the 18th; the executive committee being called for the previous day for the purpose of arranging the business to be transacted. The second reading of the Duke of Richmond's Bill is set down for the same evening, and it is probable that that measure will have passed the House of Lords long before the President can communicate to the Government the decision which the Medical Council may arrive at. Fortunately, it is not of much moment what that decision may be, for it will have little influence on the Government and little effect on the course of medical legislation. Indeed, the course which the Council has itself pursued has deprived its deliberations of any interest they might have had, for—having had seven months at their disposal for the consideration of a question which might have been readily settled within three weeks—they have intentionally procrastinated in order to throw difficulty in the way of the Government and to prevent anything being done. They have pursued this policy up to the point of deliberately and intentionally violating the pledge which they had given to the Government last year, that they would consider the subject at their "first" meeting, and have sought to obtain their purpose of obstruction by delaying their meeting until the introduction of the Medical Reform Bill without their leave has obliged them to move.

It is not likely that any one will give much for the verdict of the Council as to its own reconstitution, considering that it resisted even the discussion of that subject until forced to undertake it, and has taken pains to make it understood that it resents the intrusion of the profession into the affairs of its little family party.

The Report of the Executive Committee has been, as we have said, delayed upon any or every pretext in order that the evil day of that discussion might be put off, and the conclusion they have arrived at has been kept a dead secret for the same reason.

Not so dead but that we learn that the committee were unanimous in trying to prevent reform, and only differed by a narrow majority upon the policy of making no report at all, or of making a sham report. The sham report carried the day, and the Government are to be gravely advised to reform (!) the Council by adding four additional highly respectable old metropolitan big-wigs as Crown representatives. The Government is indisposed to trouble itself with the family jar, and would quite possibly be glad to escape the difficulty by liberalising the Medical Council after this unique manner, so that we think it certainly behoves the profession to gird up its loins for a decisive battle which will be undoubtedly fought out when the Bill reaches the Commons. The Government has heard no one's views on the subject, but those of a few great people in London, and has been taught by them to pooh-pooh the profession outside the postal district, or, indeed, we might say, outside Saville Row and Harley Street. It remains for the profession to make itself known to our ministers, not as a mere herd of fee-getters, but as a great, earnest, and influential body, united in a determination not to allow the reform of the profession to be marred by being entrusted for execution to a party of venerable anti-progressionists who are, as a conclave, directly interested in obstructing all improvement.

## Medical Council Re-construction.

There is one point in the much-desired reconstruction of the General Medical Council which even the Council itself may see to be necessary—*i.e.*, the restoration to the Council of the power which has lapsed into the hands of the Executive Committee and the President. To those who review the proceedings of the Council *ab extra* it certainly seems that the most important functions of the

Council are performed by the Executive Committee without either the order or the assent of the Council—that the most decisive pronouncements on matters of medical policy are made by the President without the warrant of the Council's decision to authorise them—and that "only for the honour of the thing"—the members of the Council might as well remain at home as come to London to confirm the decrees of their Committee, and to remit to that Committee the doing of all important acts. In fact, it seems to be at the unrestrained discretion of the President whether or not the Council shall meet at all, for on many occasions that officer has—*proprio motu*—postponed the meetings until there remained nothing for them (the Conncil) to meet about.

On the present and on former occasions the business of the Council has been indefinitely adjourned at the absolute will of the President and the Executive Committee, and, if we entertained any hope that the Council would do its business as other similar bodies do theirs, we should suggest to them that it would be well for them to decide for themselves the time when they should re-assemble, and the limits of the action to be taken, or the pledges to be given by their vice-regents.

## British Dental Association,

A meeting, of which we give a report in another column, was held at Willis's Rooms, on Monday, March 3rd, in order to take the first steps in the formation of an association with the above title. The meeting was the largest and most fully representative of the dental profession that has ever been assembled, and comprised the *élite* of that profession in the metropolis, as well as a large number from the provinces, many more of whom, unable to attend offered their support to the projected association. The resolutions submitted to the meeting were all unanimously agreed to. The association is started under highly favourable circumstances; we shall watch its progress with interest and sympathy, and we have little doubt it will be able to effect much in every direction towards the advancement of the dental branch of our profession.

## The Case of Mr. Millerchip.

About a fortnight ago we drew attention to the unjustifiable severity of the sentence that had been passed upon this Poor-law medical officer, and we are glad to see, by the last issue of the *Lancet*, that we do not stand alone in our condemnation of the judgment passed by Lord Coleridge. It appears, moreover, from facts which have come to the knowledge of our contemporary since we made our remarks on the subject, that Mr. Millerchip has been even more badly treated than we at first supposed. Among other extenuating circumstances we may mention that this medical officer was himself ill, having recently undergone a serious surgical operation, and that competent medical practitioners certified to the effect that he was subject to epileptic fits, two of which he had within the ten days preceding the neglect for which he has been so severely punished. We feel certain that the whole profession are unanimous in wishing that the Home Secretary will be induced by these and other facts, to which we have drawn attention, to mitigate the sentence that has been passed upon this gentleman, the severity of which reflects, on the part of the judge, but little respect for the profession to which the prisoner belongs.

## The Dental License of the Irish College of Surgeons.

The Council of the Royal College of Surgeons in Ireland has definitely decided not to recognise that its future licentiates in dental surgery should be also licentiates in surgery—it having been put to them that they should make this a requirement. Outside all other considerations, it seems to us sufficient reason for this determination of the Council that, in our opinion, it would be totally illegal and contrary both to the spirit and the letter of the Dentists' Act to impose any such condition, and, if imposed, it would probably have been struck out of the Medical Council in their revision of the scheme for dental examination as proposed by the College. *Apropos* of such revision, we apprehend a very serious contest between the Irish and Scotch dental licensing bodies, backed by the great majority of practising dentists, and the London College of Surgeons, backed possibly, by the Medical Council. The curriculum of the London College seems to be regarded by many of the London dental surgeons who already hold the L. D. S. as being the standard to which the Irish and Scotch curricula ought to be forced up. The feeling in Ireland and Scotland is, on the contrary, that the London requirements are altogether excessive, both in time and in money, unfair to candidates, and unnecessary to secure the efficiency of practitioners; so excessive, indeed, that the Irish and Scotch bodies would strongly object to be forced to a level even near to that of the London College. If the London College should refuse to come down a little in its demands, and should be supported by the Medical Council, then we might have an appeal to the Privy Council for the first sime since the passing of the Medical Act in 1858.

Of the diseases of the zymotic class, scarlet fever showed fatal prevalence in Birmingham, Oldham, and Bradford; and whooping-cough in Sheffield, Manchester, and Leeds. Two fatal cases of diphtheria were recorded both in Birmingham and Salford, and 8 in London. Small-pox caused 22 deaths in London, 19 in Dublin, and one in Manchester, but not one in any of the other larger towns.

The *Broad Arrow*, of Saturday last, expresses its opinion that the observations made by Colonel Stanley (Secretary for War) upon the Army Medical Department, when introducing the estimates to the House of Commons, will be received with a widespread feeling of disappointment.

Under the will of the late Mr. Oldenshaw, of Manchester, the Stockport Infirmary receives £2,000, and the Blind Institution, of Manchester and Stockport, become entitled to a like amount.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

EDINBURGH UNIVERSITY COURT.—The University Court met on the 3rd inst. Present: Principal Sir Alexander Grant, Bart., in the chair; Lord Curriehill, the Lord Provost, Mr. Clark, the Rev. Dr. Lindsay Alexander, and Professor Campbell Fraser. *Inter alia* there was laid before the Court a petition from Professor Balfour, presented in terms of Ordinance No. 9 of the Commissioners for the purposes of the Universities (Scotland) Act, 1858, containing his application for permission to retire from the Professorship of Botany on a retiring allowance. On consideration of the petition, and a medical certificate which accompanied it, the Court resolved to report to Her Majesty in Council that, in their opinion, Professor Balfour ought to be permitted to retire from his professorship on a retiring allowance, as provided in the said Act and the relative Ordinances of the Commissioners. The library report was received from the Senatus, and referred to a committee.

HEALTH OF EDINBURGH.—Last week the deaths in Edinburgh were 96 in number, and the rate of mortality was 23 per 1,000. Chest diseases still account for more than half the deaths.

HEALTH OF GLASGOW.—Dr. Russell reported that during the fortnight ending 22nd February, there were 564 deaths registered, as compared with 629 in the fortnight preceding, representing a death-rate of 25½ in place of 28 per 1,000 living. The number of deaths of persons aged below 1 year was 116, in place of 118, and of persons aged 60 years and upwards 95, in place of 135, as compared with the preceding fortnight. The number of deaths from pulmonary diseases was 230, as compared with 283, representing a death-rate of 10 per 1,000 living, in place of 13, and constituting 40, in place of 45 per cent. of the total deaths. The number of deaths from fever was 12, in place of 9, viz., 8 from enteric fever, and 4 from typhus. The number of deaths from infectious diseases of children was 52, in place of 42, viz., 36 from whooping-cough, 8 from measles, and 8 from scarlet fever. One case of small-pox was registered during the fortnight, occurring in a West-end family, and with no clue to its origin. The two cases in hospital are recovering, although one was unvaccinated. The number of cases of fever registered was 37, in place of 45, namely, 24 enteric fever, 11 typhus, and 2 undefined. In addition to these, 111 cases of measles, 67 of whooping-cough, 47 of scarlet fever, and 17 of diphtheria, were the occasion of sanitary supervision.

THE LATE EX-PROVOST LAURIE, OF MUSSELBURGH.—By the death of this esteemed gentleman Musselburgh has lost a citizen to whom it has been indebted in many ways. Mr. Laurie was a native of Musselburgh, and attended the medical classes of Edinburgh University, afterwards acting as assistant to the late Dr. Sanderson in his native town. The remainder of his life was passed as a medical practitioner. For thirty years a member of the Town Council, nine years in the position of Provost, the deceased gentleman devoted himself zealously to the alleviation of the distressed, and the advancement of the best interests of his native town. Provost Laurie was an ardent Liberal; and, notwithstanding his failing strength, he took an active part in the fight against the Conservative candidate at the last election. As a trustee under the "Musselburgh Estate Act," he made an earnest effort to wipe off the debt which burdens the burgh; and during his tenure of office he had the satisfaction of clearing away such encumbrances to the extent of £5,000. Provost Laurie was one of the earliest members of the Local Volunteer Rifle Corps. He took an active interest in Free Church matters, and interested himself greatly in the local charities. About a year ago, his health failed greatly, and at the last election he vacated the post of Provost. Various ailments exhausted his strength, and he died on the 2nd inst., having reached his 62nd year.

A CENTENARIAN CLERGYMAN.—On the 3rd inst., the Rev. Dr. Ingram, of Unst, Shetland, died within a month of the completion of the 103rd year of his age, having been born in Aberdeen on the 3rd April, 1776. He was licensed to preach the Gospel in 1800, and ordained a minister of the Church of Scotland in 1803. At the Disruption he became a minister of the Free Church. He was a man of robust constitution, and preached very regularly to his congregation, until close upon his 100th year. The degree of Doctor of Divinity was conferred on the deceased by the University of Glasgow in 1844. He is survived by a son and three daughters, and a large number of grand and great-grandchildren. His son is over 70 years of age. The deceased's father lived to the age of 100, and his grandfather to the age of 105.

Dr. GAIRDNER ON "SPIRITUALISM" AGAIN.—Dr. Gairdner is a gentleman who dislikes being put down, and he has now avenged himself on the unmannerly public by addressing his students on "Spiritualism," and *suo more*, by the appearance of his effusion in the local newspapers. As in our day the *daily press* was not represented in the Practice of Medicine Class, it would be instructive to learn how so many specimens of Professor Gairdner's eloquence adorn the columns of the Glasgow newspapers. In addressing his students on the 3rd inst., Dr. Gairdner started a thesis the exposition of which is as hazy as its argument is unconvincing. It would have been strange if it had been otherwise—if Dr. Gairdner would have succeeded where abler men have signally failed. He defended his definition of spiritualism "as a diseased condition of the faculty of wonder." Should the word be written with a *small* or a *big* "f?" Where this "faculty" is situate we know not. We are afraid it is one for which the phrenologist may not find convenient room. If this "faculty" so-called be the very natural desire to expiscate natural phenomena, it is indeed a pity that it should be diseased to such an extent. Dr. Gairdner maintains that "there is a set of thoroughly-organised and thoroughly-known channels by which the spiritual world is revealed in the material world." Where in the name of "wonder" and science are they? And he further maintains "that spiritualism requires us to cast aside all the laws pertaining to the communication between the spiritual and the material, and to admit of a set of interferences not only in accordance with themselves, but absolutely subversive of the ordinary results of these laws." We hope the argument is clear to some of our readers. Towards the close of his address, as the papers inform us, Dr. Gairdner gave some personal experiences of "the mania which prevailed in Edinburgh in 1857 regarding electro-biology."

THE "GLASGOW MEDICAL JOURNAL."—In the March number of this journal to hand there is a paper by Dr. R. W. Forrest on "A Case of Tubercular Peritonitis, ending in Recovery," with the fork-lightning system of temperature so dear to a certain section of the profession. The discussion on this paper is worthy of note, as being wonderfully hopeful in tone as to the recovery of tubercular peritonitis. We are getting on pretty well here. We have cured "galloping consumption," phthisis, by the hypophosphites of lime and

soda in three-grain doses; diphtheria in an equally marvellous manner; and puerperal fever! The journal also contains a long paper by Dr. James Adams, on "An Improved Apparatus for Spray Inhalations." It is needless to say that it is well written, abounds in forcible sentences, and, having an opponent to punish, the chastisement is well laid on. Dr. Adams makes an excellent case against Dr. Siegle for piracy. The paper is well worth reading, were it for nothing else than a lesson in style. Dr. Adams may exclaim with his Sabine friend—"*Exegi monumentum* (though it be of tin) *ære perennius.*"

A "MIRACULOUS CONVERSION."—Leo Ross (Dr. Mixey) the distinguished reader, has, it would appear, been miraculously converted." He caught it, of course, in Scotland. If one could only get an interest in American organs, wear a plaid (a Scotch one, if possible), and simper among ladies in West-end drawing-rooms, "conversion," considering the religious peristalsis of the North-of-the-Tweed, might not be a bad thing at all. At a "meeting" held in Airdrie the other day, Dr. Mixey entertained his large audience religiously rather than *Shakespereanly*, and at the close of the ceremony an "interview" was offered, in the regular way, to "anxious inquirers." What has Dr. Gairdner to say to the "faculty of wonder" here?

## Literary Notes and Gossip.

FIFTY years ago there were eight medical journals in the United States. Now there are fifty-three of the regular school, nine homœopathic, and seven eclectic. In the last fifty years, 1,630 regular journals and 214 homœopathic have been started, leaving about six per cent. of the former and four per cent. of the latter class as survivors.

* * *

BENTLEY and TRIMEN'S Medicinal Plants is likely to make a very huge work, if we may judge by the present instalment which has now reached to the thirty-seventh part, and seems likely to run on *ad infinitum*. When completed, it will probably be the most exhaustive and complete treatise on the subject in our own or any other language; and well wishers for its success must regret that its great expense will preclude the chance of possessing it to any but the wealthy.

* * *

THE first part of an "Atlas of Histology" has just made its appearance under the editorship of Dr. Klein, the illustrations being by Mr. Noble Smith, L.R.C.P. That Dr. Klein is equal to the task of producing a standard work of reference in histology, there can be no two opinions; and that Mr. Smith is a competent artist the first part of the Atlas now before us shows. Our only doubt about the probable success of the venture is on account of its cost. Judging from the first part, it will run into a large number, which, at 6s. each, will, we fear, frighten the majority of students. But whatever he result the work deserves success.

* * *

ANOTHER of Messrs. Cassell, Peter, and Galpin's useful serials has been brought to a close by the issue of the last part of their "Domestic Dictionary." This work was commenced in monthly parts, and now forms, completed, a companion volume to the "Dictionary of Cookery," issued by the same firm. We have frequently had occasion to refer to its pages during its monthly issue, and have always found the information reliable, and up to date. Now the volume is complete, it forms a valuable adjunct to the library shelves as a work of everyday utility and reference.

* * *

THE first number of the *Index Medicus*, which we announced as in contemplation, is now before us, and really supplies "a long felt want." There is a useful future in store for this publication, as it will become an absolute necessity for librarians and literary men. The *Index Medicus* is under the editorship of Dr. Billings, Chief Surgeon of the United States Army, and Dr. Robert Fletcher; the publisher is Mr. Leypoldt, of New York. From a hasty perusal of the first number, the work appears to be most thoroughly done, and we unhesitatingly congratulate all concerned in the venture. We have searched for several books and articles published during January under various headings, and find them duly chronicled. Of course, the idea is not new, as yearly *Digests* have been issued in this country from time to time, but a monthly magazine of current medical and scientific literature will be most valuable.

* * *

THE *Journal of Science*, which has appeared quarterly during the past fifteen years under the editorship of Mr. Crookes, F.R.S., starts a new volume as a monthly. The publication of *The Analyst*, the official organ of the Society of Public Analysts, has been transferred to Messrs. Baillière, Tindall, and Cox. The editorial management remains as before in the hands of Dr. Muter and Mr. Wigner. The publication of *The Transactions of the American Gynæcological Society* for Europe, has been transferred from Messrs. Trübner and Co. to Messrs. Baillière, Tindall, and Cox. The new journal, *St. Luke* (Physician, Evangelist, and Lawyer), announced for March 1st, has not yet put in an appearance; and a rumour reached us as we were going to press that, finding he was not particularly wanted, *St. Luke* had decided not to introduce himself at present.

* * *

SINCE the appearance of our last "Literary Notes," a new medical journal has been started in Philadelphia, under the auspices of the Jefferson Medical Association of that city. There are no new features in it, except that it is smaller in size and lower in price than existing publications. But then, on the other hand, the conductors are honest as to their intentions and expectations; this, at least, is a recommendation. They say "we cannot bring ourselves to employ the worn out phrases of prefaces and announcements in which the public are gravely assured that a particular book or new periodical would not have appeared, but 'really, a want long felt,' 'constant inquiry,' &c., has at last induced a modest and retiring spirit to expose itself in print to the world." We are glad to find from this introduction that at least one of its staff reads the *Medical Press;* 'tis gratifying to personal vanity to come across one's own expressions a second time, even in a new publication.

* * *

WE have often wondered that no author should have come forward to write a work "on Naval Hygiene." We have treatises on civil and military hygiene by the score, such as Parkes', Gordon's, Cameron's, Carpenter's, Wilson's, Halton's, and a host of smaller ones, but no recognised work for our Royal and Commercial Navies. This is somewhat singular, as minor powers like Italy, and even Turkey, have their treatises, whilst France is represented by that scholarly work of Fonssagrives. We are led to these remarks by the appearance of the second edition of the United States representative, "Naval Hygiene," by Dr. J. Wilson, Medical Director of the United States Navy. Perhaps some competent scribe will take the hint, and remove this reproach to the sanitation of the nineteenth century in imperial Britain.

* * *

A MELANCHOLY interest attaches to the issue of the new work by the late Dr. Handsel Griffiths, "A Text-book of Materia Medica and Pharmacy," it being his last literary production prior to his untimely death. Dr. Griffiths was an author of unusual ability, his writings showing evidence of laborious research and original thought; few writers had a more brilliant future before him, but his labours were finished, and at the age of thirty he succumbed from fever and overwork, having done as much in that short life as most men accomplish in more than double the number of years. After Dr. Griffiths' death, the editing and revision of the work in its passage through the press was generously undertaken by Dr. Duffey, Examiner in Materia Medica in the Queen's University, the result being that the profession has now one of the ablest, if not the best, work on the subject in the English language. We shall refer to the book at length upon another occasion.

* * *

CLINICAL note-taking is now so universally adopted in all our leading hospitals and private practices, that the rapid issue of temperature charts in various forms, is but a natural evolution of "demand and supply." During the past few days, two other candidates in this direction have made their appearance, and are now on our table. "Moore's Clinical Chart" is of the ordinary oblong size, improvements for

which over-existing ones are claimed; that it is more definite, gives more space for remarks, is printed in red, so that the tracings in black ink or pencil are more distinctly seen, and that the charts are mounted as a blotting-pad in 50 or 100, which renders their use much more pleasant to the surgeon than single charts, which are continually creasing or rolling up at the wrong moment. The other is issued by Messrs. Harvey and Reynolds, of Leeds, is smaller, and less pretentious. It is, in fact, more suitable for private practice than ward work, and will be found very useful to those who adopt "Smith's Visiting List," the chart being issued in books of fifty the same size as that publication, at the low price of two shillings. Both charts well answer the purpose for which they are designed.

## ELECTIONS AT THE IRISH COLLEGE OF SURGEONS.

THE election of two Councillors in the room of Drs. B. F. M'Dowell and Ledwich took place last week. The candidates, as we have stated, were Dr. Brunker, formerly Surgeon to the Dundalk Infirmary; Dr. W. Thornley Stoker, Professor of Anatomy in the College School; Mr. Baker, Dental Surgeon to Steevens' Hospital; Mr. Swanzy, Professor of Ophthalmology in the College School; Mr. Bennett, Professor of Surgery in the Universi of Dublin; Dr. Madden, a retired army medical officer; and Dr. Meldon, Surgeon to Jervis Street Hospital. Dr. Brunker, and Dr. Stoker were elected, Messrs. Baker, Swanzy, and Bennett being next at the poll.

An election of an Examiner in the Professorial Court, in the room of the late Dr. John Barker, was also held, the candidates being Dr. Frazer, Dr. Kilgariff, Dr. Charles F. Moore, Dr. Robinson, Dr. G. M. Foy, and Dr. Charles McDowell. Dr. Frazer was elected.

## UNIFORMITY OF EDUCATIONAL STANDARD UNDER THE DUKE OF RICHMOND'S BILL.

OF many blots upon the face of the Government Bill, to which we may have to refer, none is so obvious or so intolerable as the complete abandonment of the principle upon which the Bill was constructed. The *râison d'etre* of the measure, as we have always understood it, was to put a peremptory stop to the competition of licensing bodies for the student's money—a competition which led to his being received to the diploma on any terms—and it was to achieve this object by putting all licensing bodies on exactly equal terms. This principle has, we regret to say, been deliberately abandoned, and the conjoint examining boards of each division of the Kingdom are to be allowed to bid down for the patronage of the student as they may please. We needly hardly say that this fault in the Bill would involve its being opposed by every one who desires to keep up the standard of medical qualification. The Royal College of Surgeons in Ireland has already protested in the form of a memorial addressed to the Lord President, and we understand that other bodies will follow the example thus set.

# Correspondence.

## INTERNAL MEDICAL REFORM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Ofttimes when reading letters of complaint and grievances in our medical journals, and especially in the *British Medical*, I have asked myself the question, Would a new Medical Act remedy any of the evils thus painfully and glaringly exposed?

I have come to the conclusion that fresh legislation will not be productive of any real good until we have purged ourselves clean, healed up internal sores, and placed ourselves in a sound and healthy condition, so that we may be worthy to receive additional legislative protection.

With your permission, I should like to dwell briefly upon some of those internal complaints from which we suffer, and shall enumerate them before dealing with each separately. The complaints are:

1. The dispensing of medicines.
2. The abuse of unqualified assistants.
3. Want of honour one to another, and the neglect of the great commandment, "Do unto others as you would be done by."
4. Medical advertising.
5. Gratuitous medical advice and clubs.
6. A bundle of minor ailments as indirectly connected with the foregoing.

Confining myself for the present to the first evil, I must refer your readers to the long correspondence and disclosures recently published in the pages of the *British Medical Journal*, from which no other conclusion can be drawn but that the dispensing of medicines and the keeping of private surgeries are detrimental to the social position of medical men, and thus injurious to the whole profession. Our competition with druggists leads to counter-prescribing. If we assumed our proper *role*, and prescribed for our patients, as is done in Scotland and Ireland, we should elevate the general tone of the profession, and at the same time it would be possible to institute a proper system and tariff of fees, based on cash payments. Thus book-keeping and bills would be virtually dispensed with. At present the majority of practitioners carry on their profession like tradesmen, though they expect professional consideration and rank.

I look to the younger members of the profession for its emancipation from the thraldom of trade, and I trust the strong expression of opinion recently evoked on the subject of dispensing medicines will not be unproductive.

Hoping that you will allow me space in your next number for a few words on the second complaint,

I am, yours faithfully,

VERAX.

London, 28th February, 1879.

## VACCINE LYMPH AND THE DEATH-RATE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have been an attentive reader of the letters and other contributions that have appeared from time to time in your journal, as well as the lay press, on the general epidemic of small-pox and the death-rate in Dublin.

As to the Dublin death-rate I will say nothing, unless so far as the few observations I shall make on small pox and vaccination may throw some light on the matter.

I think it is now conceded on all sides by those competent to give an opinion on the subject, that lymph taken from a revaccination is *not* trustworthy as a prophylactic against small-pox, if used for a *primary* vaccination. Recollect, I am not now discussing the propriety or otherwise of revaccination, or of what lymph should be used in the operation; but when I tell you that there are districts in Ireland in which the *primary* operation *on infants*, and revaccination on adults, are indiscriminately performed with lymph—which I still characterise as spurious—taken from a revaccination, viz., from the arm of an adult who had been previously successfully (?) vaccinated, I fancy you will agree with me in saying that such practice is an element in increasing or rather fostering the epidemic, and consequently augmenting the death-rate, from small-pox at least. If vaccinators would attend religiously to the directions given by Dr. Cameron ("Manual of Hygiene," p. 149), "*Never* take lymph from cases of revaccination," and carry out fully his other suggestions for the operation, there would be no necessity for the absurd suggestion that I see was brought forward at the Galway Board of Guardians, of *inoculating* a calf in the hopes of procuring *therefrom pure vaccine lymph*.

I think I am correct in saying that none of the correspondents on this subject have put this point forward as a cause of the high death-rate. At the same time, what I state I know to be true, and I could call on a Local Government Board Inspector to corroborate what I assert; and that being so, am I not justified in saying that such a practice is nt

sound? Yea, go further, and say it is reprehensible, and that it has a direct tendency to foster variola, and bring the undoubted efficacy of vaccination into disrepute.

I am, &c.,

IVORY POINT.

**University of Dublin.**—The following degrees were conferred on the 25th ult :—

BACHELOR IN SURGERY.—West Whedale Wilson.

BACHELOR IN MEDICINE.—Benjamin Thos. M'Creery, Thomas Mason, West Whedale Wilson.

DOCTOR IN MEDICINE.—Robert Maude Maginniss, William Owen (*in absentiâ*).

**The Plague.**—A supplement to the official *London Gazette*, issued yesterday, announces that Surgeon Major Colvill and Dr. Joseph Frank Payne have been appointed by the Lord President of the Council Medical Commissioners to represent Great Britain in the investigation in Russia of all the circumstances connected with the recent outbreak of plague in that country.

## NOTICES TO CORRESPONDENTS.

DR. PATTERSON CASSELLS, Glasgow, is thanked for the translation of Prof. Delstanche's memoir "On Osseous Tumours of the External Auditory Meatus." These papers will be commenced as soon as we are able to devote the necessary space.

DR. JOSHUA CHITWOOD, Connersville, Indiana.—The back numbers for the year will be sent you. Many thanks.

PHYSIOLOGIST will find the subject referred to in our "Literary Notes and Gossip," present number.

A FOREIGN GRADUATE.—Either *Le Progrès Médical* or *La France Médicale*; both are good journals.

THE FLECTRIC LIGHT IN SURGERY.—A lecture will be given at the Royal United Service Institution, Whitehall Yard, S.W., on Thursday, March 13, at 4 p.m., "On the Adaptation of the Jablochkoff Electric Light to Medical and Surgical Purposes," by Mr. Balmanno Squire F.R.C.S. The lecture will be illustrated by practical experiments with the light. Gentlemen who may wish to be present are requested to apply for cards of admission (by letter only) to Mr. Balmanno Squire, 24 Weymouth Street, Portland Place, W., and to write on the outside of the envelope "Request for card."

WIDOWS AND ORPHANS OF MEDICAL MEN.—By an announcement in our advertising columns it will be seen that the next Quarterly Court of Directors will be held on the 18th inst. for the purpose of receiving applications from candidates for assistance.

MR. W. H. STONE, M.B., will deliver the Croonian Lectures at the London College of Physicians on March 19, 21, 26, at 5 o'clock each day. Members of the profession (ladies excepted) will be admitted on presentation of their card.

A MARE'S NEST.—A Plymouth correspondent telegraphs: "A strange affair has just happened at Linkinhorne, Cornwall. Last week William Seymour, a miner, was found dead in Phœnix mine. It was supposed he had died in a fit, and a verdict to that effect was returned at the coroner's inquest, and the body was interred last Sunday week. A neighbour of the deceased the next night dreamed that a gentleman in a carriage and pair had driven up to the house of the mother of the deceased and said her son was not dead, but had been buried alive. This dream being noised abroad, the next night seven or eight men went to the graveyard, dug up the coffin, and carried it to a chapel. They unscrewed the coffin-lid, and there was the body of their comrade apparently still living and breathing. So convinced were they, in their excitement of this, that they sat him up, and while some attempted to revive him by stimulants and friction, others ran off to the nearest surgeon, two miles distant. Mr. Newsam, L.R.C.P., soon arrived and examined the body, and then stated that the man was dead, and had been dead some days. Mr. Newsam very properly rebuked the men for their folly, and the body was then quickly reinterred; but the matter has excited much commotion."

DR. LYSTER, Liverpool.—Cases received.

MIDWIFE.—You will find notice of the next examination on reference to our advertising columns.

DR. H.—If possible next week, but you must be content to take your turn. It is quite impossible for us to put a quart into a pint bottle.

### POLICE CAUTION.

WE have received the following official note from the head of the Metropolitan Police, which we print for the guidance of our readers:—

The police authorities desire attention directed to a man who is in the habit of calling at the houses of medical gentlemen, &c., inquiring for some person who does not reside at the address, and during the temporary absence of the servant, steals articles from the room where he is left and decamps.

DESCRIPTION.

Age, about 30; height, 5 feet 11 inches; stout build; complexion hair, and whiskers, fair; chin clean shaved; dress, black coat, light colour trousers, high black hat; carrys a walking-stick; respectable appearance.

Information should be given to the Director, Criminal Investigation Department, Great Scotland Yard, or at any Metropolitan Police Station.

Scotland Yard, London, March 10th.

HUNTERIAN SOCIETY.—This evening (Wednesday), at 7½ o'clock, Council Meeting.—8 o'clock, Dr. Herman, "On the Treatment of Fibroid Tumours of the Uterus by Ergot."

ROYAL MICROSCOPICAL SOCIETY.—This evening, at 8 o'clock, Mr. A. D. Michael, "A Contribution to the Knowledge of British Oribatidæ."—Mr. G. Hoggan, "On the Development and Retrogression of the Fat-cell."

CLINICAL SOCIETY OF LONDON.—On Friday, March 14, at 8½ p.m., Mr. Heath, "Foreign Body (end of a Silver Catheter) in the Bladder; Median Lithotomy: Recovery."—Dr. C. T. Williams, "Case of Tapping a Fœtid Pyo-pneumothorax."—Dr. Cayley, "Gangrene of the Lung treated by Incision."—Mr. Keetley, "A Case of severe Traumatic Meningitis treated in the stage of Coma by Cold Douche for 2½ hours; Recovery."

### VACANCIES.

Bedminster Union.—Medical Officer for the 4th District. Salary, £40. with the usual extras. Applications to the Clerk to the Guardians, Flax Bourton, Near Bristol.

Bournemouth General Dispensary.—Resident Medical Officer. Salary, £120. Applications to Mr. J. Haggard, Pine Hurst, Bournemouth, before March 29.

Cancer Hospital, Brompton.—House Surgeon and Registrar. Salary, 100 guineas, with board, &c. Applications to the Chairman of the Board, at 167 Piccadilly, London, before March 22. (See Advt.)

Cheltenham General Hospital.—Junior House Surgeon. Salary, £60, with board. Applications to Colonel Hodson, Cheltenham.

Dorset County Hospital.—House Surgeon and Secretary. Salary, £80, with board. Applications to the Chairman, at Dorchester, before March 19.

Guest Hospital, Dudley.—Surgeon on the Staff. Honorary. Applications to the Secretary before March 24.

Ledwich School of Medicine and Surgery.—Professor of Materia Medica and Therapeutics. Election, March 15. (See Advt.)

Leeds General Infirmary.—House Physician. Salary, £100, with board. Applications to Dr. Heaton, the Infirmary, Leeds, before March 19.

Macclesfield General Infirmary.—Senior House Surgeon. Salary, £100, with £10 extra for the second year, with board. Also a Visiting House Surgeon to visit patients at their homes. Salary, £70, with board. Applications to the Chairman, Macclesfield Infirmary, on or before March 22.

Naas Union, Clane and Timahoe Dispensary.—Medical Officer. Salary, £125, with fees; and £15 as Medical Officer of Health. Election, March 24.

South Dublin Union, Rathmines Dispensary.—Medical Officer and Medical Officer of Health. Salary, £125, with fees, and £31 as Medical Officer of Health. Election, March 18.

Tipperary Union, Cappagh Dispensary.—Medical Officer. Salary, £110, with fees, and £20 as Sanitary Officer. Election, March 15.

Waterford Union, Kilmeaden Dispensary.—Medical Officer. Salary, £120, with fees. Election, March 21.

### APPOINTMENTS.

BATEMAN, F., M.D., F.R.C.P.L., Honorary Physician to the Norwich Lunatic Asylum.

DEVIS, C. J., M.R.C.S.E., House Surgeon to the Hereford General Infirmary.

DONNELLY, M. A., L.R.C.S.I., Resident Medical Officer to the Westmoreland Lock Hospital, Dublin.

FENNELL, J. P., L.K.Q.C.P.I. & L.M., L.R.C.S.I., House Surgeon and Secretary to the Stourbridge Dispensary.

HALL, S., M.R.C.S.E., Medical Officer of Health for the Lymington Urban Sanitary District.

HELE, N. F., M.R.C.S.E., Medical Officer, &c., for the Aldeburgh District of the Plomesgate Union, Suffolk.

HOLBECHE, A. O., L.R.C.P.Ed., M.R.C.S.E., a Resident Surgeon to the General Dispensary, Birmingham.

IRVINE, W., M.D., C.M., an Assistant Physician to the Hospital for Consumption and Diseases of the Chest, Liverpool.

JONES, R. A., M.R.C.S.E., Medical Officer and Public Vaccinator for the Llanidan District of the Carnarvon Union.

MACKENZIE, J. A., M.B., C.M., Medical Officer and Public Vaccinator for the Parishes of Sleat and Strath, Invernesshire.

MASON, S. B., L.R.C.P.Ed., L.F.P.S.G., Medical Officer and Public Vaccinator for the Blaenavon District of the Abergavenny Union.

## Births.

BLACKER.—March 4th, at Thrapston, Northamptonshire, the wife of E. J. Latham Blacker, of a daughter.

BOND.—March 4th, at 17 Delahay Street, Westminster, the wife of T. Bond, F.R.C.S., of a son.

O'FARRELL.—Feb. 28, at Boyle, co. Roscommon, the wife of George Plunkett O'Farrell, M.D., of a daughter.

## Deaths.

BATESON.—On the 27th ult., at St. George's Road, Southwark, Henry Bateson, M.D., aged 63.

HOGAN.—March 2nd, at 30 Wentworth Place, Dublin, Edward Michael Angelo Hogan, L.R.C.S.I., Surgeon, A.M.D., in his 27th year.

HOUSEMAN.—On the 24th ult., at Knaresborough, Edward Cooke Houseman, M.R.C.S.E., aged 42.

HYDE.—On the 1st inst., at Thorne House, Clifton, Edward Hyde, M.R.C.S.E., aged 68.

IRVINE.—On the 1st inst., George Richard Irvine, M.D., of Guildford Street, Russell Square, aged 40.

LEACH.—On the 27th ult., at Moss Hall, Heywood, Jesse Leach, F.R.C.S.E., aged 66.

LISTER.—On the 1st inst., at Doncaster, John Lister, F.R.C.S.E., aged 63.

NICHOLS.—on the 24th ult., at Augusta House, Rotherhithe, George William Nichols, M.R.C.S.E., aged 50.

PRATT.—On the 10th ult., at Rothesay Terrace, Bute Docks, Cardiff, Alfred Septimus Pratt, Staff-Surgeon, Royal Navy.

TIBBITS.—on the 2nd inst., at Burfield House, Highgate, the beloved wife of Herbert Tibbits, M.D., of 30 New Cavendish Street, W.

# IRISH POOR-LAW INTELLIGENCE.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

41 & 42 Vic., Cap, 52.

(8th August, 1878.)

An Act to consolidate and amend the Acts relating to Public Health in Ireland.

(*Continued.*)

66. *Power to charge Water Rates and Rents.*
67. *Certain Provisions of* 10 *and* 11 *Vict., c.* 17, *and* 26 and 27 *Vict., c.* 93, *incorporated.*
68. *Power to Supply Water by Measure.*
69. *Register of Meter to be Evidence.*
70. *Penalty for Injuring Meters.*
71. *Power to Supply Water to Authority of Adjoining District.*
72. (*Verb.*) *Sanitary Authority may require Houses to be Supplied with Water in certain cases.*—Where on the report of the sanitary officer of a sanitary authority it appears to such authority that any house within their district is without a proper supply of water, and that such a supply of water can be furnished thereto at such cost as the Local Government Board may, on the application of the sanitary authority, determine under all the circumstances of the case to be reasonable, the sanitary authority shall give notice in writing to the owner, requiring him within a time therein specified, to obtain such supply, and to do all such works as may be necessary for that purpose.

If such notice is not complied with within the time specified, the sanitary authority may, if they think fit, do such works and obtain such supply, and for that purpose may enter into any contract with any water company supplying water within their district; and water rates may be made and levied on the premises by the authority or company which furnishes the supply, and may be recovered as if the owner or occupier of the premises had demanded a supply of water and were willing to pay water rates for the same, and any expenses incurred by the sanitary authority in doing any such works may be recovered in a summary manner from the owner of the premises, or may, by order of the sanitary authority be declared to be private improvement expenses.

73. *Powers of Water Company for Supplying Water to Sanitary Authority.* 25 *and* 26 *Vict., c.* 27.
74. *Vesting of Public Cisterns, &c., in Sanitary Authority.*
75. *Water for Public Baths, or Trading or Manufacturing Purposes.*
76. *Duty of Urban Authority to provide Fire-plugs.*

### Provisions for Protection of Water.

77. *Penalty for causing Water to be corrupted by Gas Washings.*
78. *Sanitary Authority may take Proceedings to Prevent Pollution of Streams.*
79. (*Verb.*) *Power to Close Polluted Wells, &c.*—On the representation of any person to any sanitary authority that within their district the water in any well, tank, or cistern, public or private, or supplied from any public pump, and used or likely to be used by man for drinking or domestic purposes, or for manufacturing drinks for the use of man, is so polluted as to be injurious to health, such authority may apply to a court of summary jurisdiction for an order to remedy the same; and thereupon such court shall summon the owner or occupier of the premises to which the well, tank, or cistern belongs if it be private, and in the case of a public well, tank, cistern or pump, any person alleged in the application to be interested in the same, and may either dismiss the application, or may make an order directing the well, tank, cistern, of pump to be permanently or temporarily closed, or the water to be used for certain purposes only, or such other order as may appear to them to be requisite to prevent injury to the health of persons drinking the water.

The court may, if they see fit, cause the water complained of to be analysed at the cost of the sanitary authority applying to them under this section.

If the person on whom an order under this section is made fails to comply with the same, the court may, on the application of the sanitary authority, authorise them to do whatever may be necessary in the execution of the order, and any expenses incurred by them may be recovered in a summary manner from the person on whom the order is made.

Expenses incurred by any rural authority in the execution of this section, and not recovered by them as aforesaid, shall be special expenses.

### Gas Supply, etc.

80. (*Verb.*) *Powers of Urban Authority for lighting their Disirict.*
81. *Power for Sale of Undertaking of Gas Company to Urban Authority.*

### Regulation of Cellar Dwellings and Lodging-houses.

*Occupation of Cellar Dwellings.*

82. (*Verb.*) *Prohibition of Occupying Cellar Dwellings.*—It shall not be lawful to let or occupy, or suffer to be occupied separately as a dwelling, any cellar (including for the purposes of this Act in that expression any vault or underground room) built or rebuilt after the passing of this Act, or which is not lawfully so let or occupied at the time of the passing of this Act.
83. *Verb). Existing Cellar Dwellings only to be Let or Occupied on certain conditions.*—It shall not be lawful to let or occupy, or suffer to be occupied separately as a dwelling, any cellar whatsoever, unless the following requisitions are complied with; that is to say:

Unless the cellar is in every part thereof at least seven feet in height, measured from the floor to the ceiling thereof, and is at least three feet of its height from the surface of the street or ground adjoining or nearest the same; and

Unless there is outside of and adjoining the cellar and extending along the entire frontage thereof, and upwards from six inches below the level of the floor thereof up to the surface of the said street or ground, an open area of at least two feet and six inches wide in every part; and,

Unless the cellar is effectually drained by means of a drain, the uppermost part of which is one foot at least below the level of the floor thereof; and,

Unless there is appurtenant to the cellar the use of a water closet, earth closet, or privy, and an ashpit furnished

with proper doors and coverings, according to the provisions of this Act ; and

Unless the cellar has a fireplace with a proper chimney or flue, and an external window or windows of such an area as shall be deemed sufficient by the sanitary authority and made to open in a manner approved by the sanitary authority (except in the case of an inner or back cellar let or occupied along with a front cellar as part of the same letting or occupation, in which case the external window may be of any dimensions not being less than four superficial feet in area clear of the sash frame)

Provided that in any area adjoining a cellar there may be steps necessary for access to such cellar, if the same be so placed as not to be over, across, or opposite to the said external window, and so as to allow between every part of such steps and the external wall of such cellar a clear space of six inches at the least, and that over or across any such area there may be steps necessary for access to any building above the cellar to which such area adjoins, if the same be so placed as not to be over, across, or opposite to any such external window.

84. (*Verb.*) *Penalty on Persons Offending against Enactment.*—Any person who lets, occupies, or knowingly suffers to be occupied for hire or rent, any cellar contrary to the provisions of this Act, shall be liable for every such offence to a penalty not exceeding twenty shillings for every day during which the same continues to be so let or occupied after notice in writing from the sanitary authority in this behalf.

85. (*Verb.*) *Definition of Occupying as a Dwelling.*—Any cellar in which any person passes the night shall be deemed to be occupied as a dwelling within the meaning of this Act.

86. (*Verb.*) *Power to close Cellars in cases of two Convictions.*—When two convictions against the provisions of any Act relating to the occupation of a cellar as a separate dwelling place have taken place with respect to the same cellar within three months (whether the persons so convicted were or were not the same) a court of summary jurisdiction may direct the closing of the premises so occupied for such time as it may deem necessary, or may empower the sanitary authority permanently to close the same, and to defray any expenses incurred by them in the execution of this section.

### Common Lodging Houses.

87. (*Verb*). *Registers of Common Lodging-Houses to be kept.*—Every sanitary authority shall keep a register in which shall be entered the names and residences of the keepers of all common lodging-houses within the district of such authority, and the situation of every such house, and the number of lodgers authorised under this Act by such authority to be received therein ; and such register shall at all reasonable times be open to the inspection of any rate-payer of such district.

A copy of any entry in such register, shall be received in all courts and on all occasions as evidence.

88. (*Verb.*) *All Common Lodging-Houses to be Registered, and to be kept only by Registered Keepers.*—A person shall not keep a common lodging-house or receive a lodger therein unless the house is registered in accordance with the provisions of this Act ; nor unless his name as the keeper thereof is entered in the register kept under this Act. Provided that when the person so registered dies, his widow or any member of his family may keep the house as a common lodging-house for not more than four weeks after his death without being registered as the keeper thereof.

89. (*Verb.*) *Sanitary Authority may refuse to Register Houses.*—A house shall not be registered as a common lodging-house until it has been inspected and approved for the purpose by some officer of the sanitary authority ; and the sanitary authority may refuse to register as the keeper of a common lodging-house a person who does not produce to the sanitary authority a certificate of character, in such form as the sanitary authority direct, signed by three inhabitant householders of the union respectively rated to the relief of the poor of the union within which the lodging-house is situate for property of the yearly rateable value of six pounds or upwards.

90. *Notice of Registration to be affixed to Houses.*

91. (*Verb.*) *Byelaws to be made by Sanitary Authority.*—Every sanitary authority shall from time to time make byelaws—

(1) For fixing and from time to time varying the number of lodgers who may be received into a common lodging-house, and for the separation of the sexes therein ; and

(2) For promoting cleanliness and ventilation in such houses ; and

(3) For the giving of notices and the taking precautions in the case of any infectious disease ; and

(4) Generally for the well ordering of such houses.

92. (*Verb.*) *Power to Sanitary Authority to Require Supply of Water to Houses.*—Where it appears to any sanitary authority that a common lodging-house is without a proper supply of water for the use of lodgers, and that such a supply can be furnished thereto at a reasonable rate, the sanitary authority may by notice in writing require the owner or keeper of such house, within a time specified therein, to obtain such supply, and to do all works necessary for that purpose ; and if the notice be not complied with accordingly, the sanitary authority shall remove such house from the register until it is complied with.

93. (*Verb.*) *Limewashing of Houses.*—The keeper of a common lodging-house shall, to the satisfaction of the sanitary authority, limewash the walls and ceilings thereof in the first week of each of the months of April and October in every year, and shall if he fails to do so be liable to a penalty not exceeding forty shillings, and in the event of such failure the work may be executed by the sanitary authority, and the cost recovered in a summary manner.

94. *Power to order Reports from Keepers of Houses Receiving Vagrants.*

95. (*Verb.*) *Keepers to give Notice of Fevers, &c., therein.*—The keeper of a common lodging-house shall, when a person in such house is ill of fever or any infectious disease, give immediate notice thereof to an officer of the sanitary authority, and also to the Poor-law relieving officer of the union in which the common lodging-house is situated.

96. (*Verb.*) *As to Inspection.*—The keeper of a common lodging-house, and every other person having or acting in the care or management thereof, shall, at all times when required by any officer of the sanitary authority, give him free access to such house or any part thereof ; and any such keeper or person who refuses such access shall be liable to a penalty not exceeding five pounds.

(*To be continued.*)

## ANIMAL VACCINATION IN IRELAND.

The following letter from the Local Government Board was recently read at the Galway Board of Guardians. At the last meeting of the guardians a medical gentleman suggested to the board the advisability of procuring a calf in order to have it inoculated for the supply of lymph. The suggestion was unanimously approved of by the board, and a calf ordered to be procured ; but one of the guardians offered a calf for the purpose, which was accepted. On the minutes going before the Local Government Board, they dissented from the medical opinion, and the following letter was read at a very large meeting of the board :—

"Local Government Board, Dublin,
"February 10, 1879.

"Sir,—The Local Government Board of Ireland acknowledge the receipt of minutes of proceedings of the Board of Guardians of the Galway Union on the 7th ult., from which it appears that a suggestion was made by a member of the board that a healthy calf be procured for inoculation, in order that a full supply of lymph be obtained for the Union, and another member having intimated his willingness to give a calf for the purpose, the guardians passed a resolution accepting this offer, and directing the medical officers to see the animal inoculated. In reference thereto, the Local Government Board desire to observe that it is not clear from this resolution whether the proposal is to inoculate the calf with small-pox virus, or with vaccine-lymph obtained from a human subject, but in neither case can the Local Government Board approve of the resolution adopted by the guardians. Small-pox virus, taken from a calf, would communicate that disease to a human subject, and be thereby a fertile source of propagating the disease, and would moreover render the operator liable to prosecution under the fourth section of the 31 and 32 Vic., cap. 87. If the proposition were to vaccinate

a calf with lymph obtained from a human subject, the Board have to state it has long since been ascertained that the animal lymph for vaccination purposes must, in the first instance, be obtained from a cow in which disease has spontaneously arisen, and that vaccination performed with lymph taken from a cow which had been vaccinated with human lymph is not reliable. The Local Gooernment Board, therefore, lose no time in cautioning the medical officers against either of the practices referred to, as the guardians, no doubt, acted in ignorance of the consequences when they passed the resolution directing their medical officers to act on the suggestion made.

"By order of the Board,

"B. BANKS, Secretary."

## DONAGHMORE UNION.

### DR. WHITES' RESIGNATION.

THE Hon. Secretary of Borris-in-Ossory Dispensary Committee forwarded minutes of proceedings of the last meeting.

The following letter was read from Dr. White :—

"To the committee of management of the Borris-in-Ossory Dispensary.

Borris Castle, 28th January, 1879.

"GENTLEMAN.—From repeated attacks of gout, advancing age, and general debility, I feel it incumbent on me to resign into your hands my position as medical officer, trusting that your interest with the board of guardians will be given in my behalf, and thanking you for your uniform kindness during my long period in office.

"I am, &c.,

"WILLIAM WHITE."

Unanimously agreed :—"That the resignation of Dr. White be accepted ; that the committee unanimously recommend Dr. White to the board of guardians for the full superannuation allowance, as from his long service (over forty-one years) they consider him entitled to it, as for thirty-eight years he never got a day's leave of absence or had a substitute paid for him." The secretary is directed to send a copy of this minute to the Local Government Board, and to the board of guardians of Donaghmore Union.

The following notice of motion was handed in :—

"I hereby give notice that I shall on Friday, the 21st of March next, propose that Dr. Wm. White, late medical officer of the Borris-in-Ossory Dispensary District, be granted the full amount of superannuation allowed by law, in accordance with the recommendation of the dispensary committee."

## CASTLEBLAYNEY UNION.

### FEES FOR LUNACY CERTIFICATES.

The Clerk read the following letter fram Dr. Anderson, of Newtownhamilton, medical officer for that dispensary district :—

"Newtownhamilton, January 31.

"DEAR SIR,—I have received extract of minutes of guardians of Castleblayney Union with reference to John Hutcheson, now an inmate of Armagh lunatic asylum. I beg to remind the guardians that I am in no sense, either officially, or in order to obtain my fee, bound to send them an explanation as to why I apply for another fee for the same person, inasmuch as the justices' order which I sent is perfectly legal and explains itself sufficiently. As a matter of courtesy, however, I beg to inform the guardians that I am neither the medical superintendent of the asylum, nor one of the governors of that institution. I cannot explain why John Hutcheson was kept for months in the asylum and then allowed out, but perhaps Dr. M'Kinstry could give them the necessary information. With regard to my present application for a fee of £1 10s., I beg to inform the guardians that on the 27th inst. I was summoned by two magistrates to visit and examine John Hutcheson, of Drumlogher, and write out a report as to his condition, and that as reasonable remuneration for my servicss the two justices of the peace, whose names appear on the document, signed and sealed an order on the Castleblayney board of guardians for the sum of £1 10s., which is according to, and within the limits of, the sum allowed by Act of Parliament made and passed on that behalf. As to the board's opinion that I should refund the former fee, I do not know whether to look upon it sincerely and call it "open effrontery," or, as I am more disposed, in the light of a "good joke," quite too practical to be entertained either by Dr. Anderson or the *sapientes* of the Castleblayney Union.

"I am, yours truly,

"W. W. ANDERSON."

"P.S.—I again beg to remind the guardians through you that there is a balance of 10s. due for a similar case, which I hold as a debt against the guardians.—W. W. A."

The board were of opinion that this was not such a letter as they should receive from an officer, and an order was made that it be forwarded to the Local Government Board for their opinion thereon.

## RATHMINES DISPENSARY.

OWING to large and increasing private practice, Dr. Browne has been obliged to tender his resignation — which was accepted with much regret—as medical officer and medical officer of health of the Rathmines dispensary district The election of his successor will take place on the 18th inst.

## ABBEY DISPENSARY, TUAM UNION.

THE Local Government Board have refused to sanction the recent appointment of Dr. Lambert as medical officer of the Abbey dispensary, owing to irregularities in the constitution of the Dispensary Committee.

A MOVEMENT is being set on foot in Galway to present a suitable testimonial to Dr. Brodie, Local Government Inspector, on the occasion of his removal to Cork.

AT a meeting of the Abbey Dispensary Committee, Tuam Union, held on the 3rd instant, Dr. Lambert was elected medical officer of the district, in the room of Dr. Ffrench, who has retired on superannuation. The election for a medical officer for Ballymacarbry District, Clonmel Union, which was held a few weeks since, has been adjourned to the 17th inst., in consequence of the candidates having received an equal number of votes.

## LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF FEBRUARY, 1879.

FEBRUARY 1st.—Parker, Thomas Heazle ; Clover House, Drumona, co. Leitrim ; Lic. R. Coll. Surg. Irel. 1878.

6th.—Lindsay, John ; 164 Park View, Mount Pottinger, Belfast ; Lic. R. Coll. Phys. Edin. 1878, Lic. R. Coll. Surg. Edin. 1878.

11th.—Barrett, Lindsey ; Donegal ; Lic. R. Coll. Phys. Edin. 1879, Lic. R. Coll. Surg. Edin. 1879.

11th.—Rothe, Edward James ; Grangegorman Prison, Dublin ; Lic. R. Coll. Surg. Irel. 1878.

12th.—Forbes, Armitage ; 7 Upper Kevin Street, Dublin ;

Lic. R. Coll. Surg. Irel. 1878, Lic. R. Coll. Phys. Edin. 1879.

14th.—Harding, James Joseph; 4 Alexandra Place, Cork; Lic. R. Coll. Surg. Irel. 1878.

15th.—Poett, Patrick Matthias; 6 Victoria Terrace, Terenure Road, Rathgar, co. Dublin; Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

19th.—Hanrahan, James Palmer; 13 Upper Rutland Street, Dublin; M.D. 1878 and M.Ch. 1878 Q. Univ. Irel.

25th.—Fox, Matthew; 11 Blackhall Street, Dublin; Lic. R. Coll. Surg. Irel. 1875, Lic. 1876 and Lic. Mid. 1876 K. Q. Coll. Phys. Irel.

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING MARCH 1, 1879.

| | | |
|---|---|---|
| Total registered deaths in Dublin and suburbs* | ... | 257 |
| Ten years average of same week ... ... | ... | 188 |
| Excess of mortality above average ... ... | ... | 69 |
| 10 weeks' ratio of deaths Rathmines | 20·7 | per 1,000 |
| „ „ „ Donnybrook† | 33·7 | „ |
| „ „ „ Blackrock | 21·6 | „ |
| „ „ „ Kingstown | 28·9 | „ |
| „ „ Entire Dublin District | 42·5 | „ |
| COMPARATIVE RATIOS—London ... | 25·5 | „ |
| „ „ Glasgow ... | 28·4 | „ |
| „ „ Edinburgh ... | 23·0 | „ |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Owing mainly to an increase in the mortality amongst persons aged 60 years of age and upwards, the deaths are 30 in excess of the number registered during the week ending 22nd February, but they are less than in any of the first seven weeks of the year.

Sixty-five deaths from diseases of the respiratory organs were registered, being 1 under the number in the preceding week, and very much less than in any of the earlier weeks of this year, but 18 over the average for the ninth week of the last ten years; they consist of 58 from bronchitis, 5 from pneumonia, and 1 each from laryngitis and lung disease unspecified.

Zymotic diseases caused 44 deaths, being similar in number to those in the preceding week, but 13 over the average for the 9th week of the ten years 1869-78: they include 19 from small-pox, 5 from fever (1 typhus and 4 typhoid), 5 from measles, 7 from scarlet fever, and 2 each from whooping-cough and croup. One-half of the deaths in this class were children under five years of age.

Nine of the deaths from small-pox are chargeable to the North City and 10 to the South City districts. The total number is 3 over the number in the preceding week, but compares favourably with the mortality of other recent weeks; the increase occurred in the North City. Forty-two new cases of small-pox were admitted into the Dublin hospitals during the week, against 37 in the preceding week, and 62 in the week ending 15th February. There were but few cases of typhus, scarlet fever, or measles admitted into the principal hospitals; the typhoid fever cases (11) were 1 over the number for the previous week.

Fifteen children died from convulsions.

Fourteen deaths were attributed to heart disease, 1 to aneurism, 8 to paralysis, 5 to apoplexy, 2 to insanity, 1 to cephalitis, 4 to brain disease unspecified, 1 to jaundice, 4 liver disease unspecified, and 3 to Bright's disease.

Phthisis caused 29 deaths, scrofula 2, hydrocephalus 8, and cancer 3.

Six accidental deaths were registered.

BELFAST.—Nine deaths from fever, 4 from whooping-cough, 3 from scarlatina, 1 each from measles, and diphtheria, and 6 from diarrhœa, were registered during the week.

TABLE *showing for* EIGHT LARGE TOWNS, &c., *the* AREA, *in Statute Acres; the* POPULATION *in* 1871; *the* ANNUAL RATE OF MORTALITY *per* 1,000 *Inhabitants represented by the Number of Deaths registered during the Week ending Saturday, March* 1, 1879; *the Total Number of* BIRTHS AND DEATHS *registered during the Week with the Number of* DEATHS *at certain Ages, and from* SEVERAL CAUSES, &c.

### ON THE EFFECTS WHICH CHANGE OF POSITION MAKES ON BRUIT DE SOUFFLET, OF A SOFT CHARACTER, OCCURRING IN THE CARDIAC REGION. (a)

By HENRY KENNEDY, A.B., M.B.,
Physician to Simpson's Hospital, and the Whitworth, Drumcondra.

Some years have now elapsed since a paper was published, the object of which went to prove that in certain cases where a bruit de soufflet of a soft character existed in the heart, the sound was much modified by altering the position of the patient. I found the soufflet was much more distinct when the individual was in the horizontal position, and that at times a sound, quite audible as he lay on his back, could literally not be heard when he stood or sat up. In this paper I gave a number of instances illustrative of the fact. Since then I have been in the habit of noting down any similar cases which came under my notice, and will now, with your leave, give the briefest sketch of some of these.

In a diagnostic point of view, the subject appears to myself one of considerable importance, and has not received that attention it seeems to me to demand. Balfour, of Edinburgh, is the only writer I know who has noticed my paper, and he speaks more than doubtfully of the truth of the fact. On my own mind there is not the slightest shadow of a doubt, and I must take the evidence of my own senses before that of any one else. Before making any more remarks I will give some of the cases I have more recently noted down, and which will afford me a foundation for the truth of the facts I advance.

Case I.—Keogh, a boy, æt. 14, passed through fever of the typhoid type in the Cork Street Hospital. He had a very clear, prolonged bruit, but of a soft character, occupying the first sound of the heart, and situated directly over the aortic valves. From this point, in any direction, it got weaker. When lying, the pulse was 66, and the bruit long and clear; when he sat up the pulse beat at 76, and the bruit was not at all so clear, and was distinctly shorter. This boy had very visible bounding of the carotid arteries, of the nature of which I can offer no explanation; and my own observation of him was confirmed by Dr. Grimshaw.

Case II.—Armstrong, a man, æt. 57, in Steevens' Hospital, had a marked mitral murmur under mamma, occupying the first sound. The pulse was irregular; the bruit was clearly louder whilst he was lying. This man shortly after died, and on examination all the cavities were found dilated, and the heart fatty, the orifices being larger than natural, but there was no valvular disease. This case, which I saw myself, was kindly given to me by Dr. Grimshaw.

Case III.—A man in the Adelaide Hospital, whom I saw, had a distinct strong soufflet just over aortic valves, the loudest point being possibly a shade lower than this. On making him sit up the pulse quickened and the bruit became very much less clear. This observation was confirmed by Dr. Head.

Case IV.—Clayton, a woman, æt. 50, passed through light fever. A distinct soufflet was heard in the first instance over the aortic valves, but on closer examination it was found to be much louder under the mamma. Whilst she was still in bed soufflet got weaker, and was much more so when she got up, and was finally lost entirely when she stood, but remained very distinct when she lay. This observation, which was a very striking one, was also confirmed by others.

Case V.—Kirwan, a sailor, went through spotted typhus, during which sounds of heart could barely be heard, and there was no impulse. It was, in fact, a very severe case. When getting well his pulse fell to 56, and was thrilling. In this state a very distinct soufflet could

(a) Read before the Surgical Society of Ireland.

be heard, nearly on a line with the nipple, and close to the sternum. On standing up no morbid sound could be heard. This case was also confirmed by others.

Case VI.—Moulang, a girl, æt. 19, passed through a severe attack of spinal arachnitis. Six years before she had had acute rheumatism very prolonged. She now has a very strong soufflet with first sound, loudest under mamma, but heard in different directions from this. This sound wes not modified in any way by position.

Case VII.—Carty, a shoemaker, had acute rheumatism some years since, which lasted six weeks. Has now well-marked soufflet below mamma. When he is up it is not at all so clear nor so long. It seems to be mitral, and is loudest below nipple, but very nearly on same line. Several observations were made on this case and confirmed by others.

Case VIII.—Fitzpatrick, a boy, æt. 11, in passing through an attack of typhoid fever got pericarditis, which was attended by severe pain. Frottement was very distinct at one period of the attack, but then changed into a single soufflet, which finally could only be heard when lying, and at last disappeared entirely. Three distinct observations were made on this case.

Were it necessary I could give a number of other cases where similar observations were made, and with the same result. But I believe that such would not add in any way to the truth of the fact I would advance.

The cases just given have, in a certain degree, been selected; because they were, one and all, seen by other parties, who confirmed what I myself had observed. If this be not considered sufficient evidence of the truth of what I have advanced, I know not what would be; and I think the mere assertion of any one, no matter how strongly urged, cannot shake the fact. In these cases too, I did not rest satisfied with a single observation, but repeated the experiment on different occasions in the same case; and found the results still the same. That I sometimes met instances where no appreciable difference could be observed is admitted; and one such I have given this evening. But it must be recollected that I have expressly limited the fact to those cases where the soufflet was of a soft character. If it were very loud, or rough or rasping, position did not seem to alter its character; at least not at all to the same degree as when the sound was soft. I have notes, however, of some instances where the signs of valvular disease were accompanied by loud sounds, and yet even here the upright position made them weaker than when the patient was lying. I may state here I have met no instance where a morbid sound, heard when the patient was standing, disappeared on his lying down. This, however, has been stated to occur by Walshe. Such an event, I take it, must be very rare.

In the class of cases to which I have been directing attention, it matters not whether the soufflet be functional or organic. In some of those given it will be recollected the sound entirely disappeared. Those I take it were functional cases. In others again the bruit was permanent and modified by position in the way indicated.

The point which I have raised is, I believe, of some consequence. Many cases occur where we are in doubt as to the existence of a bruit. In such the question will often be set at rest by putting in force the plan I advance. There is one class of cases in particular in which it is of great moment to determine the presence of a bruit; I mean those where the heart is fatty or becoming so. In such, Stokes observed that a soft bruit may frequently be heard with the first sound of the heart, and so add to the accuracy of the diagnosis. Now it is precisely in such cases that the plan I advocate becomes available; and I may add, that I have been able to determine the exact nature of some of these cases by this method. Also in parties who were advancing in life, and presented themselves for insurance, I have found it to clear up what was otherwise obscure, and must therefore have remained in doubt. So that the point, it may be fairly inferred, has a practical bearing, of which we should not lose sight.

P.S. Since reading those brief notes I have received a letter from my venerable friend Dr. Benson, in which he states he is able to confirm the point I have advanced, and that it was chiefly where the bruit was of the functional kind he had observed it. Such testimony I take to be invaluable.

## FIBROMA REMOVED FROM THE BACK OF A MAN UPWARDS OF EIGHTY YEARS OF AGE. (a)

By B. WILLS RICHARDSON, F.R.C.S.

The case I am about to relate is of some practical interest, chiefly because (1) of the unusual situation of the tumour; (2) its exceedingly painful nature; and (3) the excellent recovery made by one of an age so advanced as the subject of the case. I was, moreover, induced to bring it before the Society, having obtained from the tumour, thanks to the freezing microtome, large sections of sufficient thinness to show its structure distinctly.

The patient, Thomas Smith, æt. 82, was admitted to the Adelaide Hospital on the 20th July, 1878, and gave the following history of his case:—

He was born of healthy parents, and had brothers and sisters, all of whom were likewise healthy. He himself enjoyed uninterrupted good health up till two years before admission, when a very painful swelling appeared between the shoulder-blades. It was cut into by some one he consulted. The pain was apparently relieved for a time; having informed us that in about eight months it became as bad as ever. It was, at this period, mistaken for anthrax and was again incised, but he was positive no matter escaped.

Continuing to enlarge, and the pain being incessant, he was forced thereby to come to hospital, and was admitted on the day I have mentioned.

I was not surprised, at a superficial examination leading to its being mistaken for an anthrax; for, to the eye, the overlying skin marvellously resembled the skin covering of anthrax in its early stage. For instance, it was of a little higher level than the adjoining healthy skin, was uneven on the surface, and of a livid red colour. The touch, however, at once revealed the nature of the case, and unmasked a hard, movable, flattened tumour. The livid skin covering was adherent to the underlying mass, its movability resulting from the almost complete absence of deep adhesions. It was exceedingly painful and tender when pressed, and was situated over and to the right of 2nd and 3rd dorsal vertebræ. The constitution did not appear to sympathise with the tumour. There was no evidence of organic disease.

Anodynes, internally and hypodermically, for the relief of the pain, availed but little; and from the time of the admission of the patient up till the day of operation gave nothing more than very transient relief. Indeed, it was the continued suffering that forced him to submit to operation for the removal of the tumour. This was done under carbolic spray on the 3rd of last September, my friend, Mr. William Thomson, kindly lending me his assistance in the absence of my surgical colleagues on their autumnal holydays. Ether was the anæsthetic used, and I here take the opportunity to exhibit the inhaler with which I have of late administered ether vapour on many occasions. It is economical to buy, costing only from eighteenpence to two shillings, and most economical to use, the consumption of ether being reduced to a *minimum*. It is nothing more nor less than a baby's soft felt hat, which is large enough to cover the face, and sufficiently close in texture to check ether waste.

One day, when about to use it with an old woman from Connemara, she exclaimed, "Are you going to use that 'cawbeen' with me?" and since then it is known in our hospital as the "cawbeen" inhaler.

(a) Read before the Surgical Society of Ireland. The discussion will be found on page 281.

To return to the operation. After the tumour had been removed and a few divided arteries ligatured with carbolised gut, the wound was washed with the chloride of zinc solution, and its edge secured together with the strongest gut. A carbolised oil-pad was then applied and secured in position with a roller of antiseptic gauze. A full opiate was given to the patient, and he had a moderate amount of stimulants. It is unnecessary to weary you with the daily reports of the case, but I should observe that the carbolised cat-gut ligatures dissolved so rapidly that the edges of the wound separated from one another. This may not have delayed matters, a large cavity being the result of the operation, which would probably have only healed by granulation. The wound was sprayed daily, and when washed thereby, was dressed with a carbolic cream I described a few years ago in the *Dublin Medical Journal* for November, 1869. The cream is formed thus :—

Crystallised carbolic acid, 3 drachms ; oil of theobroma, 4 drachms ; castor-oil, 3 ozs. ; creasote, 10 to 20 drops. Mix with heat, and when cold add, with trituration, ½ oz. of castor-oil. A few drachms of oxyde of zinc ointment are sometimes a useful addition to the cream.

It was completely healed on the 15th of last September, and he left hospital two days afterwards in good health, and most thankful for being relieved of so much suffering.

It may not be uninteresting, before the specimens are examined, to give the opinions of two or three of the most distinguished pathologists of the day regarding the fibromata.

Rindfleisch, for example, does not separate the fibromata from the sarcomata, and considers the prototype of fibromata to be the formed tissue of cicatrices. The common fibroid (desmoid), according to this observer, consists of a fibrous, reddish-white, stiffly-elastic substance, so dense and tough, or even hard, that it creaks under the knife. Its structural elements are identical with those of cicatricial tissue. He alludes to Virchow having set up a "fibro-muscular tumour" as a special variety of fibroma, because of the great resemblance of the fibroma spindle-cells to the fibre-cells of unstriped muscle.

Curious to say, although Rindfleisch does not "wish for a moment to question this resemblance," and thinks it desirable to "begin by comparing sarcoma with inflammatory proliferation, the spindle-cells of the tumour with those of the cicatrix," he, nevertheless, admits that "it would be very difficult to draw a hard and fast line between spindle-cells and unstriped muscular fibres, so far as their minute structure is concerned."

He looks upon the bands of spindle-shaped cells and the rounded deposits of embryonic tissue, imbedded here and there among the fibrous bundles, as transitional structures from which the fibrous tissue is developed in the same way as the cicatrix is developed from the embryonic and spindle-cell tissue.

Speaking of the spindle-shaped cells found in the fibromata, Billroth observes that "if we consider these fibre-cells as young connective tissue, we shall have to christen them spindle-celled sarcomata or fibro-sarcomata. Thus," he proceeds to say, "you see, even in the case of simple fibrous tissue we are already in difficulties with histology and histogenesis."

"There are two reasons which would induce him to agree with Virchow in regarding these fibro-cellular tumours as myomata—viz., the remarkably club-shaped undulating form of the nuclei and the definite arrangement of the fibrous layer into bundles, and the difficulty of isolating the individual fibres, except by the aid of recognised chemical means." . . . "The probability of one of these tumours being a myoma is very great if the new growth is found in the substance of the uterus."

Billroth's experience is, that the development of the fibromata in the "subcutaneous cellular tissue belongs to the rarities." He says, also, that they "almost never" occur in advanced life.

He dwells upon a point in the clinical history of the fibromata of considerable prognostic value. Although it is generally admitted that the pure fibromata are eminently benign, cases now and then occur to lead to the suspicion of their occasional capability of infecting the system. "They are not infectious," he remarks, "though infectious fibromata are said to occur ; a number of such tumours near each other may coalesce and infiltrate the surrounding parts, and occasionally cause fibrous degeneration of the nearest muscles, bones, and lymph-glands." The infectious fibromata which he has "seen were all fibro-sarcomata, and, like pure sarcomata, they may occur metastatically in the lungs." He further says, that "combinations with other forms of tumours, mostly with the sarcomata, as before remarked, occur, and generally in such a way that the primary tumours show a fibrous character, while the recurrence and the secondary tumours are found to be soft cellular sarcomata." He has seen such a case : "A man, æt. about 25, of healthy appearance, had a fibro-sarcoma on the abdominal wall as big as a large walnut ; the tumour was completely extirpated, but in the wound there appeared another tumour, and later on in different parts of the body several soft tumours ; the patient became marasmic, and after a few months he died."

The lung was found to be full of soft sarcomatous tumours.

Before I sit down I should state that allusion in this communication to many writers on the fibromata would have been an unpardonable and unnecessary waste of time. I must not, however, omit to mention that recurrent fibrous tumours have been from time to time described at the meetings of this Society, and have not been overlooked by Sir James Paget in his "Lectures on Surgical Pathology."

Finally, although I headed this communication with the term "Fibroma," I am rather inclined to place it among the fibro-sarcomata, its structure being so largely composed of spindle-cell tissue. Whether it is likely to recur I should not like to prognosticate ; still, I would not be surprised at its doing so, the clinical history being suspicious.

As I have referred to the muscular structure of the uterus and to uterine fibromata, as well as to the structure of cicatrices I have on the table, that the members may compare them with the sections of the fibro-sarcoma removed from the back, (1) a section of the whole uterus of a girl, æt. 15 ; (2) a section of the whole of a fibroma, upwards of an inch in diameter, removed by my colleague Dr. Purefoy, from the uterus of a woman, æt. 33 ; and (3) a section of an intractable ulcer on the surface of a cicatrix including the underlying cicatricial tissue. These sections are all extremely thin, and can be examined with the ⅛th objective.

## LOCAL FIXATION DURING OPERATIONS.

By WILLIAM W. BRERETON,
Medical Officer Oughterard Workhouse, &c., &c.

When chloroform came into general use the old practice of strapping the patient on the table became unnecessary, the relaxed limbs lying on the table could be placed in position by the surgeon for operation. At the present time, however, we do not always see those happy results produced, and in addition to cases where the anæsthetic does not agree, or is not permitted owing to chronic disease, there are many operations performed while the patient is quite capable of motion. No doubt this is chiefly owing to the proved dangers of anæsthetics, and the theory of removing the bad symptoms by giving more or "pressing it on" not being believed, or mistrusted, there is often difficulty in keeping up the effect of the anæsthetic during the operation, although it was perfect at first. Under these circumstances I have found great advantage from fixity during the operation—not the old strapping down, but a local fixation.

A good assistant can produce fixity to a great extent, but never as perfectly as that produced by mechanical means. Take a case of shattered hand from gunshot; place the limb on a splint to which two blocks are attached which act as legs, and are fastened to a table or the side of the bed, the limb can be fixed in any position, with a roller, the surgeon will find his manipulations easy as compared with those on a limb held mid-air by an assistant. I have removed sequestra from a limb placed on a splint, but it is difficult to prevent rotation of the limb without a special splint, which is not always convenient during the operation. I have tried many experiments with strong tourniquet bands placed above the seat of operation, and it is surprising the amount of fixity can be obtained in this way; by using an Esmarch's band, or applying any strong bandage for a short time, the limb can be completely surrounded, and pressure applied without inconvenience. On this principle I constructed a species of tourniquet by which I could fix any portion of a limb I required. I first constructed this so that when fastened to the edge of the operating table it would act like a vice, the jaws bearing on the strong tourniquet band. This suited a hand or foot, but with other portions of a limb it was not convenient, as the support of the table was lost to a great extent.

For general use a tourniquet on this principle, and acting in a flat frame which can be fastened to the table in any position, will be found to be a convenient and easy mode of producing fixity. I constructed mine in oak, but the instrument makers have made one in iron which is more easily fastened to the table, (*a*) and is strong enough to produce fixity when placed on the strongest thigh. I have no doubt that were local fixity more frequently used as an aid to operation that it would prove a great advantage to many surgeons, and more particularly to the juniors of the profession, as it gives the greatest confidence to feel there is no motion, and the incisions can be made with the greatest accuracy. I bring this subject before the profession, and hope it may be of assistance to the humbler members, who, like myself, although remote from towns, endeavour to work at practical surgery.

I know there are many who were encouraged to work by operating on Esmarch's principle, and to whom I hope fixation will prove as great a boon as I have found it.

# Clinical Records.

## SCLERODERMA WITH VITILIGO—ADDISON'S DISEASE.

M. Fereol exhibited a patient suffering from scleroderma at a recent meeting of the Hospital Medical Society, Paris. In order the better to show the difference between this special discolouration and the bronzed tint of Addison's disease, he at the same time exhibited a typical example of the latter malady, so as to compare the two cutaneous lesions side by side. In the first patient he pointed out the singular disposition of the stains, which maculated the skin, and the constitution of these stains, formed by a black and white grain resembling the maculated arrangements of certain serpent skins—the black grains being ranged in linear series, following in the different regions the configuration of the dermic papillæ, just as represented by M. Sappey. The patient had been shaved, and it could be noticed that the hairy skin, like the rest of the integument, presented numerous spots of vitiligo, some rounded, others irregular on a brown ground, and totally deprived of hair, the genital parts being of a tint less deep than the skin of the abdomen. On the mucous membrane of the mouth, and at the edge of the lips, could be noticed a slight brown tinge.

M. Fereol insists on a fact which he had observed in his patient for a month—namely, that he has seen the spots of vitiligo modify themselves, certain white parts have become brown, and reciprocally coloured parts have become decoloured, so that it would seem that the pigment underwent change and was carried from one place to another.

In contrast with the dyschromic lesions previously described in the patient suffering from Addison's disease, M. Fereol pointed out the absence of any localised discoloured stain, there was a uniform brown tinge, very deep on the face and hands, still deeper on the genital parts, which were as black as those of a negro; whilst on the mucous of the lips, on the internal face of the cheeks and tongue, were stains of a very deep black.

M. Fereol thought the first patient had no capsular lesion, that he was suffering from a special dyschromia, which might be called *vitiligo punctée*, and which depended on the same cause which produced the scleroderma.

### *Aphasia—Cerebral Tumour.*

M. Magnan presented some specimens found at the autopsy of an aphasic woman, æt. 61, who died at the Hospital St. Anne. This patient had been aphasic and hemiplegic on right side; at apex of heart there had been a bruit de soufflet, and the diagnosis had been aphasia from embolism.

At the post-mortem examination M. Magnan found osteitis of the left parietal, with adherence of the dura mater to the top of the upper third of the ascending frontal convolution and of the lower part of the first and second frontal convolutions.

There was also a glio-sarcomatous tumour, the size of an egg, between the insula and third frontal, the insula and lower third of the third frontal being thus dissected by the tumour.

(*a*) The engraving representing this tourniquet will be found on page 222.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, MARCH 14TH.

Dr. Bristowe in the Chair.

Dr. Bridges showed

### A CASE OF DISEASE OF THE SKULL IN A CHILD, WITH CONGENITAL SYPHILIS.

Such a case was described by M. Parrot, and was brought before the notice of the last meeting of the Pathological Society by Dr. Benlow. There was a considerable ridge on each side of the sagittal suture, and a prominence of both parietal eminences.

Dr. R. Crocker showed

### A PATIENT SUFFERING FROM SCLERODERMA.

The child had been exhibited at a former meeting of the Society. She was now far advanced towards recovery.

Dr. Theodore Williams

### ON A CASE OF FŒTID PYO-PNEUMOTHORAX WHERE TAPPING HAD BEEN PERFORMED WITH GREAT BENEFIT.

A gentleman, æt. 28, had had pleurisy of both sides, causing partial adhesions of both pleuræ, and shrinking of the right side of the chest. Four and a half years later, he had catarrhal pneumonia of the left lung, ending in excavation at the apex, and tolerable quiescence; but at Cannes, in December, 1877, his cough and expectoration increased, inducing vomiting; and the sputum was so offensive as to cause loss of appetite and diarrhœa, not only in the patient himself, but also in his attendants. For several months he suffered from pyrexia, great loss of flesh and strength, and from symptoms of septicæmia, chiefly induced by the offensive atmosphere in which he lived, which various antiseptics palliated but failed to purify. Dr. Marcet detected large quantities of lung tissue in the expectoration, and found proofs of a considerable sized abscess discharging through the left bronchus. The symptoms continued, and the patient came to London, where in June, 1878, Dr. Andrew Clark and Dr. Theodore Williams concluded, from the physical signs and the character of the expectoration, that in addition to some cavities in the upper lobe, there

existed either (1) a limited pyo-pneumothorax, or (2) a large superficial cavity in the lower lobe, the pleura being adherent, and from the loudness of the cavernous sounds, their limited area, and the large quantity of lung tissue found, they considered the latter supposition the most probable. In either case tapping was recommended, and on June 18th Mr. Erichsen punctured the dense wall of the abscess between the sixth and seventh ribs, and evacuated a pint of fœtid pus. The operation, though it gave rise to temporary but somewhat troublesome cutaneous emphysema, afforded entire relief to the patient. The cough was reduced, the expectoration fell to two ounces in amount. All fœtor ceased, and with it all symptoms of septicæmia, including a fall in temperature, pulse, and respiration. The discharge from the drainage tube was small and inoffensive, and neither in it or in the sputum could any traces of lung disintegration be found after the operation. The patient, who had extensive disease of the lungs, recovered sufficiently to drive out daily, and died seven months after the operation, of thrombosis of the left pulmonary artery. Post-mortem examination revealed a circumscribed pyo-pneumothorax on the left side, limited by very dense adhesions. The sac communicated by two openings, each of such size that the lung tissue exposed actually formed part of the wall of the pneumothorax. The upper lobe contained two large cavities, communicating by a bronchus, the upper one opening into the pleura. The right lung showed partial adhesions, some old consolidation and fresh tubercle at the apex. Dr. Williams remarked that the limited form of the empyema had been caused by the successive attacks of pleurisy, and the pneumothorax arose from the pleural abscess bursting into the upper cavity, and thus discharging through the bronchus. Owing to the fistula being too small to admit free discharge, matter was retained, became fœtid, and gave rise to septic symptoms, and further ulcerative processes in the lung, which continued till the operation, which entirely changed the aspect of affairs, and converted an acute ulcerative empyema into chronic pneumothorax, adding several months to the patient's life. The difficulty of diagnosis lay in (1) the limited character of the pyo-pneumothorax, (2) in the loudness of the cavernous sounds, this being due partly to the large size of the pulmonary fistula, and partly to the conduction of sounds from the lower cavity, and (3) the character of the sputum, which was by no means simply purulent, but contained a quantity of lung tissue.

Dr. Cayley

ON A CASE OF GANGRENE OF THE LUNG TREATED BY INCISION.

The patient, a man, æt. 40, was admitted into the Middlesex Hospital on Dec. 30, 1878. He had been ill five weeks with cough, spitting, and pain in the chest. During the last fourteen days, his breath and expectoration had been fœtid. On admission, he was in a condition of extreme prostration and emaciation, with great dyspnœa, and painful cough ; with much difficulty he expectorated small quantities of horribly offensive brownish mucus. His breath had a similar odour. The physical signs were those of consolidation of the left base, but there were no distinct indications of a vomica, as bubbling crepitation or cavernous or aphonic breathing. The absence of these signs were probably due to the cavity being full, and to its not communicating freely with the bronchus. An exploratory puncture was made with a fine trocar and canula, and a few drops of pus with the same gangrenous odour as the expectoration were drawn off. The patient was now put under the influence of a mixture of ether and chloroform, and Mr. Lawson made an incision in the ninth intercostal space in a line with the angle of the scapula, three inches in length, and continued it till the cavity in the lung was reached. A gush of about ʒv. of horribly fœtid pus then took place, and with the pus several fragments of gangrenous lung tissue, the size of the end of a finger, came through the opening. A large sized drainage tube was introduced, and the cavity was washed out twice daily with diluted Condy's fluid. The operation gave the patient great relief. He ceased to cough, and to expectorate fœtid mucus, and his breath lost the gangrenous odour, and the temperature, which before the operation had been very high, fell to normal. He did not, however, rally from the state of prostration, and gradually sunk, and died on Jan. 4 ; the operation having been performed on Dec. 30. For the first two days, fragments of gangrenous lung were discharged when the cavity was irrigated. On post-mortem examination, the lower lobe of the lung was found consolidated by pneumonia, and firmly adherent to the chest wall. In its interior was a large irregular cavity, with ragged, in parts gangrenous, walls. Where most superficial, it was upwards of an inch beneath the surface of the lung. There was a small obsolete tubercular cavity, and some puckered fibrous nodules in the apex of the right lung and the kidneys were granular ; the urine, however, had not contained albumen. In this case the patient was so much reduced when he came under treatment, that little hope of a successful result could be entertained. The operation, however, which was unattended either by danger or difficulty, gave complete relief to his most distressing symptoms, and by evacuating a quantity of putrefying matters which were pent up in the lung, and causing septicæmia, gave the only chance of recovery ; and possibly, if it had been performed earlier, the sloughing portions of lung might have become completely detached, and the patient have rallied.

Dr. J. E. Pollock asked how long Dr. Cayley's patient had lived after the operation. [It was answered that five days elapsed before death took place.] The points of interest in these cases were—First, the question of diagnosis before the operation ; Secondly, the eligibility of each operation. In Dr. Williams' case the difficulty was to decide whether the case was one of pneumothorax, or one of a cavity with thin walls. This was always a difficult question. It turned out that the patient was suffering from the former, yet at the time of operation, Mr. Erichsen thought that he had passed through the lung before reaching the pus. He thought that if the dulness shifted with the position of the patient, this was a valuable sign of pneumothorax. He could not remember any case where a cavity was so large that the physical signs varied much after alteration of the patient's position, or after a profuse expectoration. After all, the question of diagnosis was, perhaps, not of vital importance. He thought that cavities in the apex, where there was a good communication with the bronchus, were certainly not suitable for operation ; but where the cavity was low down, with a small external opening, and much decomposition, they should be treated by incision, or by tapping. Dr. Cayley was to be congratulated on his boldness in carrying out the only method of treatment that was likely to prove successful.

Mr. Maunder had listened with much pleasure to the cases brought forward that night. He had for some time been of opinion that no matter what the exact position of these fœtid cavities might be, they should be treated by incision, just like abscesses in other parts. As soon as a free opening was established, decomposition was checked.

Dr. Mahomed related a case of a child in Guy's Hospital, under the charge of Dr. Fagge, where a pneumonia, that was thought croupous at first, did not clear up, and gave signs of breaking up of the lung. He was anxious to treat the case by incision, thinking that it might be an abscess of the lung, following extensive catarrhal pneumonia, which would, if left, end in acute tuberculosis. But the evidence of a cavity was too doubtful to allow this course The child eventually died from the cause he had feared, and a large cavity was found. He was anxious to know how an adherent pleura might be certainly recognised. In Dr. Cayley's case there seemed to him to have been old adhesions. He also wished to ask what Dr. Williams considered to be the nature of the bilious attacks he had described.

Dr. Sedgwick related a case he had seen many years before, which he had diagnosed to be an abscess of the lung. This having become fœtid gave rise to great constitutional illness, but after some delay he thought he discovered a bulging in the seventh intercostal space, and here introduced a trocar. The result was very gratifying, and the patient (his father) recovered, though extremely ill at the time. In the following winter the same trouble recurred in the old place, and required the same treatment, by which life was prolonged for several weeks.

Dr. Douglas Powell agreed with Dr. Pollock that the interest of these cases was, first, as to the diagnosis, and secondly, the best treatment for them. In a case now under his care he had diagnosed a pyo-pneumothorax because the side was bulged, and the intercostal spaces effaced. The shifting dulness described by Dr. Pollock he regarded as a valuable test, as also the alteration of physical signs after profuse expectoration. It had been said that it did not matter much which condition was present, but he

thought that in empyema it was better to make an incision in the lowest available spot, while a cavity should be opened by a trocar over its middle. He would not touch apex cavities; but in those at the base it was very different, and here there was risk that the sputum would be inhaled into the other lung in the intervals of coughing. He would also allude to an old way of treating profusely secreting apex cavities, which was in his opinion of great service, namely, by blistering, and the application of savine ointment.

Mr. H. MARSH said that for himself he always insisted in knowing at what point the physician wished the chest to be opened; but he considered that it was generally advisable, when a low opening was needed, to make a preliminary incision over the most prominent point, and then a counter-opening below.

Mr. HOWSE wished to draw attention to the trouble often caused by old adhesions of the pleura converting the pleural cavity into a network of sinuses. This had been frequently in his experience a source of difficulty, and he thought, here, a second opening would often prove futile. As to tapping cases of gangrene of the lung, he was not inclined to recommend this procedure. He had seen three cases lately where the gangrene was very limited, and no surgical interference would have been possible.

Dr. GOODHART wished to ask Dr. Cayley what importance he laid on the presence of fœtor as an evidence of gangrene. He had not understood from the notes read that there had been distinct evidence of a cavity. In two cases under his care there was the same absence of distinct signs of cavity, though the fœtor was great. One was no doubt an old empyema. Was it not also true that these patients often went on a long time without getting worse?

Mr. G. BIRD always trusted to a double opening with a drainage-tube between them, and insisted on this as a point of importance. If this course was impracticable, he trusted to a considerable slit rather than a single puncture.

Mr. MARSH wished to ask how far it was safe to inject such cavities with iodine. In one which he had so treated, and where there proved to be a communication with a bronchus, the patient nearly died from asphyxia.

Dr. BRISTOWE remarked that it was clear there was great difficulty in distinguishing between a cavity and a pyo-pneumothorax; but he thought the treatment of both should be the same. With reference to the value of shifting dulness that Dr. Pollock had insisted on, he mentioned a case of abscess of the lung where the cavity was very large, quite large enough to have proved misleading in this respect. The recognition of elastic fibres in the sputum was often a fallacious indication, of which he related a case in point. For his part, he trusted greatly in antiseptics in the treatment of these cases.

Dr. WILLIAMS, in his reply, explained that in the recognition of adherent pleura he trusted to the old rules of retraction of the intercostal spaces, &c., and explained what was meant by the bilious attacks in his patient.

Dr. CAYLEY, in answer to Dr. Goodhart, said he had taken the precaution to puncture with the aspirator before tapping.

The meeting then adjourned.

## SURGICAL SOCIETY OF IRELAND.

SESSION 1878-79.

FRIDAY, FEBRUARY 28th, 1879.

THE Seventh Meeting of the Session was held in the Albert Hall of the Royal College of Surgeons,

Dr. EDWARD D. MAPOTHER, Vice-President of the College, in the Chair.

Mr. RICHARDSON, (hon. sec.), read the minutes of the previous meeting, which were signed.

Mr. WHEELER exhibited a

SPECIMEN OF A FIBRO-GELATINOUS POLYPUS OF LARGE SIZE,

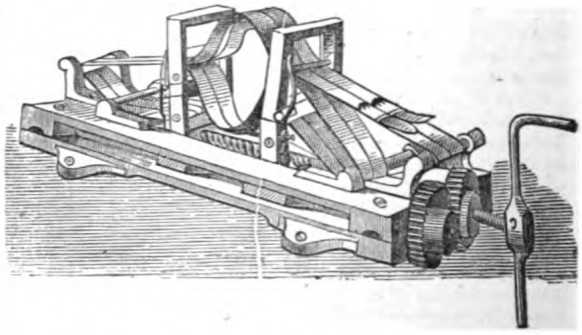
which he removed from the nose of a boy, æt. 11, on the previous Tuesday. It was rather shrunken, having been put in spirits for eight hours. At present it was in carbolic acid solution, and had been considerably larger than it appeared to be. He had other specimens preserved in spirits, which he removed from the same boy in 1878. The polypus in question, hung down behind the velum. It was not visible; and though only able to feel it by passing the finger up the naris, the boy distinctly felt it. This was the thirty-first polypus drawn from the same boy's nose. He was not aware of any other case being on record, in which thirty-one polypi had been removed. The boy complained of pain in his forehead, and pain in sneezing, and he awoke every morning with a headache—signs, as described by Pott, of malignant polypus.

VICE-PRESIDENT—How did you remove it?

Mr. WHEELER—By means of a polypus forceps.

A SURGEON'S VICE.

Mr. ROBERT M'DONNELL—I wish to exhibit to this Society a very ingenious instrument invented by my friend, Dr. Brereton, of Oughterard. He calls it a surgeon's vice. It is, in point of fact, an arrangement resembling a double tourniquet, and plays very easily, grasps the limb very firmly and serves, I think, the purpose, not only of a tourniquet, but of an additional assistant. I fancy that any of you who use it as I have done will think it a useful instrument; and although it is not probable that we, in our large metropolitan hospitals, where we have plenty of assistants, would need to have recourse to an instrument of this kind, I believe it would be an invaluable instrument in infirmaries and workhouses and places where there is a lack of assistants. It is a heavy framework of iron and works with a screw, so that the



two side-pieces retreat from each other, making the tourniquet bands which cross the limb very tense, but very evenly tense; so that it can be fastened on the limb with a great amount of force, and without causing the slightest pain. The bands control the circulation without causing any pain at all. When being put on the straps are unbuckled, the limb is laid in and they are passed round. I have used it myself on two occasions recently, one being for Syme's amputation of the foot, and the other for amputation below the knee. I am, therefore, able to speak for the practical working of it. It is quite easily applied. The elastic part of Esmarch's bandage is first put on. The limb is then laid in. I applied it above the knee, so that the pressure was on the thigh. By turning the handle the bandages are tightened until a sufficient amount of pressure is obtained to control the vessels. We found very great advantage from it in this way. After the operation the bands may be slackened to such a point as just to allow the hæmorrhage to begin again to show where the bleeding points are. The weight of the instrument keeps the limb so firm and steady, the patient cannot kick about or struggle much. [Mr. Tufnell then stripped his arm, which was placed in the instrument, and the application of it demonstrated.] I think it would be also very useful in cases where there are operations on diseased bone; because it would do the duty of an Esmarch's bandage, and at the same time keep the limb exceedingly firm, and in cases of ununited fractures it would also work well. From the experience we had of it at Steevens' Hospital it has been found to work remarkably well, and I believe the instrument will prove of real and positive use in places where there is a lack of assistants.

VICE-PRESIDENT—Where is it procurable?

Mr. M'DONNELL—It is made by Messrs. O'Neill & Thompson, at a cost of about £4 10s. It is rather expensive, but if it is to be used at all it must be made so that the screws will play easily and evenly.

Mr. TUFNELL—Although the pressure which Dr. M'Donnell applied was considerable, still it was so even that it caused no pain whatever.

VICE-PRESIDENT—There is something to be said with regard to the parts of the limbs to which it is applicable?

Mr. M'Donnell—The instrument should be applied where there are not two bones. If applied to the forearm or leg, blood will come still through the inter-osseous vessels. To be used with real success the instrument should be used on the thigh and the upper arm for operations below those points.

ON THE EFFECTS WHICH CHANGE OF POSITION MAKES ON BRUIT DE SOUFFLET, OF A SOFT CHARACTER, OCCURRING IN THE CARDIAC REGION,

which will be found on page 217.

In the succeeding discussion,

Dr. Hawtrey Benson—I think there can be no manner of doubt that Dr. Kennedy's observations are, in the main, true. I have tested them over and over again. My attention was first drawn to the fact by his original paper some years ago. Since then, I have, when in doubt, applied the test, and in some cases with great success. It is only a few months ago, a gentleman presented himself for insurance. There was a suspicious character about the first sound of his heart, with which I was not satisfied. I put him lying down on the sofa, and a well-marked murmur was developed. Two weeks ago, I was examining a patient admitted into the hospital, and I perceived a well-marked systolic apex soufflet. Next morning, when taking round the class, they failed to hear it, and to my great astonishment, the senior surgeons, who were present, failed to hear it also. I then recollected that the day before she was lying down in bed, and having put her lying down in bed again, the murmur was developed. In some cases the test has failed; but even if it succeeds in a few, it establishes the fact.

Vice-President—As regards the causation of the phenomenon, it would appear the difference that takes place in the horizontal and erect position, would be the greater rapidity or force of the heart in the erect or the sitting posture. In one of those eight cases alluded to, a post-mortem was made, and it was found that the cavities of the heart were considerably dilated. I hope we will hear some explanation of this remarkable phenomenon.

Dr. Henry Kennedy, in reply, said--I believe a cause may be offered, but I do not say it is positive proof at all. I think the heart alters its position by the upright attitude; it is thrown more on the strain, and the blood does not rub so strongly against it as when lying on the back, and it beats ten beats slower in the horizontal than in the upright position. The traction is greater when lying in bed than when upright. When standing, the heart is hanging to a certain extent, hung by the great vessels. Though supported on either side by the pericardium and other parts, still to a great extent it hangs. I am glad Dr. Benson confirms me. I have known of several cases of confirmed organic disease of the valves, and yet where the position was the cause of altering the sounds. The whole subject is one of considerable moment. In the abdomen where a soufflet exists, it is heard better when a patient is lying on the back than when standing; I am speaking now more particularly where you apply a stethoscope over the aorta. We all know it can be heard distinctly where you place a patient on the back, and apply a stethoscope over the ensiform cartilage.

Mr. B. Wills Richardson read a communication on

FIBROMA REMOVED FROM THE BACK,

and of which he exhibited sections, which will be found on page 218.

Mr. Robert M'Donnell—With regard to this interesting paper of Mr. Richardson's, I think it is very difficult to draw any conclusions from the older writers upon subjects of this kind; because of late years, such an immense advance has been made, both in instruments and methods, above all in making sections of tumours. For some years past, I have myself made, with the assistance of my extremely obliging and dexterous colleague, Dr. Bookey, sections of all the tumours removed by either myself or my colleagues in Steevens' Hospital. I look back, even a few years ago, and I find the greatest possible difference in many preparations in consequence of the admirable methods we now have. From Mr. Richardson's description, I should be inclined to say the fibroma in question should be properly grouped among the fibro-sarcomata; for in the tense, hard and essentially true fibroma, we find no spindle cells; they are, in fact, of that fully formed and tense tissue, such as in old cicatrices. I have got sections, which I venture to say, none could distinguish from the section of the tendo-achilles. No doubt the fibromata, though placed in a group by themselves, belong to the great natural family of the sarcomata. There is one very striking point about this case; one which is extremely unlike what we find in tumours of the sarcomatous type—an unusual amount of pain. The sarcomatous tumours are painless. You see an enormous breast or a testes that gives no pain except from weight and bulk. Again, those tumours have little or no tendency to affect the lymphatic glands. Billroth was the first to point out that the sarcomata do not affect the lymphatic glands, or do so very late. Their malignancy shows itself in creeping in, not through the lymphatic system, but through the veins. I have seen several cases where competent observers pronounced the disease to be a round-cell sarcoma, and I have seen it invading the glands at rather an early period; but I have never known this in a spindle-cell sarcoma. I exhibited at the Pathological Society an enormous tumour of the breast which I removed with the assistance of Dr. Colles. It turned out to be a large spindle-cell sarcoma. A year afterwards it returned, and I again removed it. Two years afterwards it had again returned in the locality and was irremovable, and the patient gradually ran down and died, four or five years after the original operation. There was not the slightest sign of contamination of the lymphatic glands. Some years ago I removed from a man named Leonard, in Steevens' Hospital, an enormously large tumour of the testis. In years afterwards there was no contamination of the glands. In several cases I have had an opportunity of following to the end of their career I have found the spindle-cell sarcoma did not contaminate the glands, but that a large proportion of the round-celled did. These two points are of great interest; the painlessness of the sarcoma, and the little tendency they have to affect the lymphatic glands.

Mr. Corley.—I should like to know if Mr. Richardson took the specimens from various parts of the tumour, because that is an extremely important point.

Mr. Richardson.—Yes.

Mr. Corley.—Mr. Richardson, doubtless, remembers a parotid tumour I brought here a few years ago; and that a very competent observer declared that although existing as a subcutaneous tumour, it was an epithelioma. Mr. Richardson having taken some specimens, his view was that it was an enchondroma. A year ago I removed another from the parotid region, and I was careful to have an examination made by the competent observer to whom I have alluded. It was principally an enchondroma, with some points distinctly sarcomatous and others myxomatous, while two or three would be pronounced as chiefly carcinomatous. Within the last week I was not surprised to get a letter from the patient in the country stating it was returning. I can only say that this is an illustration, perhaps, of what little assistance we clinical observers can get sometimes from the microscope. The whole subject is in such a state of transition that the remarks made now will, five or six years hence, be considered out of date, and as not representing anything like the pathological knowledge of the time.

Mr. B. Wills Richardson.—I concur entirely with Dr. M'Donnell in his observations with regard to the difference in appearance and structure of the sections made by the present improved methods as compared with those of even only a few years ago. The sections I made ten to fifteen years ago I am throwing out, as quite different from the present; in fact, you see things now as they ought to be seen. There is one point of my communication which Dr. M'Donnell did not catch. I did not consider this a section of pure fibroma. I mentioned that I was inclined, on account of the spindle-cell tissue predominating in it, to consider it a fibro-sarcoma. With regard to the small round-cell sarcoma, I cannot recollect seeing it infect the system through the lymphatics, although they are sometimes multiple, and this is strange if we are to consider them lymphomata. Neither have I seen the spindle-cell sarcoma do so. With regard to Mr. Corley's question, the greater portion of the tumour (fibro-sarcoma) was examined, and I do not think the remainder differed from it. I have several sections of the parotid tumour exhibited here several years ago, and named then by Mr. Corley epithelioma. The greater portion of each section is pure chondroma. I fancied that the tumour might have been a mixed one, but of this I am not positive. At all events, it is not epithelioma.

The Society then adjourned.

---

Fifty-three candidates for the Fellowship are "up" at the Royal Society.

WEDNESDAY, MARCH 19, 1879.

## THE GENERAL MEDICAL COUNCIL AND THE MEDICAL ACTS AMENDMENT BILL.

AT last there appears to be some earnest of Medical Reform being something more than barren controversies between rival medical politicians. The Medical Acts Amendment Bill, which was so nearly passing last Session, has just been read a second time in the House of Lords; and the Government has expressed its determination to pass the Bill this Session in spite of the objections that have been raised, on the score of its not having taken into consideration the re-constitution of the Medical Council. In the meantime, the latter body had issued summonses for a meeting to be held yesterday, the 18th inst., when, no doubt, the question of its re-construction was brought forward. We have, on several occasions, deprecated the apathy and dilatoriness shown by the General Medical Council on several questions in which the profession were anxiously interested; and, in fact, the general conduct, present constitution, responsibilities, expense, and general working of the Council, seem to have given universal dissatisfaction. But while we are at one with our contemporaries as regards the great and urgent desirability of having the profession better represented in that body, and in having the functions and powers more strictly defined, we differ from those who think that the re-constitution of the Council is so urgently called for, that it would be better for the Bill before Parliament to be again lost, than for the reform of the Council to be postponed for future consideration. Indeed, we hoped last year that the Bill would have passed, and we did so on the grounds that it enrolled a very large measure of reform, which insured, among other things, the appointment of a Conjoint Board in each division of the United Kingdom, which with a few exceptions gave great general satisfaction, and which might have been carried out, while the General Medical Council and the profession came to terms with respect to the proposed re-construction of the Council itself. We doubt whether, if there had been no delay in sending in the Report which this body promised to lay before Parliament, the questions of the Council could have been settled during the current Session. The Report would chiefly have reflected the views and suggestions of the Council. Or, if its Committee had obtained from the representatives of the great body of their profession their opinions and wishes, and had had them embodied in the Report, it is doubtful whether there would have been such unanimity on the subject as would have enabled the Government to have disposed of it in conjunction with the Bill now before the House.

Such an event is certainly desirable, as it would have then put an end to all further medical legislation; everybody would be satisfied, medical education would be such as it had never been before, and the medical men of the future paragons of perfection, both in their general and professional accomplishments! If the Medical Council and the chosen representatives of the general practitioners could come forward at once, and say to the Government, "We have unanimously agreed upon a scheme by which the Council may be re-constructed to the satisfaction of all parties—of the public, of the profession, and of the Council itself," there would then be plenty of time for such clauses to be inserted in the present Bill, as would constitute the latter one large and exhaustive Government measure of Medical Reform. But at present we see no likelihood of so desirable a consummation of this great question. Rightly or wrongly, the General Medical Council stop the way; and wherefore, we would ask, should it stop the way, and be the means of postponing the Conjoint Scheme, and other natural reforms that have received the sanction of the Legislature? In fact, the question is now narrowed to this: whether the Medical Acts Amendment Bill should be allowed to pass without any further obstruction, and the constitution of the Council deferred for future consideration; or, whether both questions be postponed to such time as they can be settled together. Now, considering that if the Bill is passed it can come into practical operation at once, while if the Council were reformed to-morrow, it would only have a prospective and indirect influence upon medical education, &c.—it stands to reason that, as far as the interests of the public are concerned, it would be much better if the former alternative were adopted, than if matters are allowed to reman in *statu quo* for an indefinite period. But it is said that, if these questions are dealt with separately, years may elapse before Parliament will be disposed to deal with medical questions again. Such, undoubtedly, would be the case if Government had again to face such opposition and such a confusion of medical opinion as they have hitherto had to contend with in their endeavour to comply with the wishes of medical reformers. If, however, Parliament were not called upon to legislate on the subject until all parties concerned had settled upon the plan on which the

General Medical Council should be re-constructed, the introduction and passing of a short special Bill (which might, for instance, be called the "Re-construction of the Medical Council Bill") would give the Government very little trouble, and take up very little of its valuable time. We, therefore, by no means despair of seeing the Medical Council established before long on a firm basis, even if the present Government Bill should, as it now stands, receive the sanction of the Legislature. While we trust that no further opposition will be given to the passing of the Bill, we think it probable that the prospective reform of the Medical Council will be the more thorough and the more satisfactory for the time and consideration that will have been devoted to it.

## THE MEDICAL ACTS (1858) AMENDMENT BILLS, 1879.

(*Continued from page* 208.)

### Women's Examination and Registration.

The following are the abstracted clauses with reference to the admission of women to the profession :—

"The examination rules shall provide for the admission of women to the examinations" (sec. 15, sub-sec. 4, line 23).

A licensing body may, if it pleases, but is not obliged (sec. 5, line 20) to grant its diploma to women (sec. 22); but, if "on application of any such licentiate (who has passed the conjoint board) . . the corporation refuse (or fail within a month) to attach him (or her) by granting him (or her) some medical diploma, the applicant shall be entitled to be registered . . without being attached to any medical authority."

Licentiates (including women) receiving diplomas from a licensing body shall not thereby "be entitled . . to any place in its government, or any privileges in connection with it." (Sec. 5, line 23, also sec. 22, sub-sec. 2.)

The sense of these clauses is that it will be permitted for women to present themselves to the Conjoint Board, and to receive there an examination equal in extent to that to which men are submitted, but modified, if necessary, in deference to decency. Having passed this examination they must present themselves to a licensing body, and demand a diploma. That body may comply or refuse. If it refuses, then the women may go at once and register their examination certificate as a full qualification, without any diploma.

These clauses seem to provide as good a settlement of the question of admission of women to the profession as can be suggested. They are necessary, if women are to be admitted at all, because some of the licensing bodies, notably the London College of Physicians, refuse peremptorily, to grant their diplomas to women on any terms; but we question whether it would not be better at once to clear the Irish and Scotch conjoint schemes of any such complication by the agreement of all the co-operating bodies to admit women to examination, and to grant them diplomas, on exactly the same terms as men. As far as Ireland is concerned, the College of Physicians has already done so, and has even encouraged women to take its licences by giving them certain unjustified exemptions from examination in regard to their Swiss degrees. The two Irish Universities have already admitted women to examination in Arts, and probably would offer no objection to receiving them as medical candidates. The Apothecaries' Hall of Ireland would be, probably, only too glad to get them. If, then, the Irish College of Surgeons granted its diplomas to women on exactly the same terms in all respects as that of male students, the possibility of a licentiate getting on the Register without a diploma would cease *quoad* Ireland.

To enable the Irish co-operating bodies to effect this purpose, it might be necessary to add to sec. 5 a rider something like the following:—"Provided always that if, by any scheme under this Act, it is provided that the medical authorities of any division of the kingdom shall grant diplomas to women, upon the same terms in all respects as to men, then, upon confirmation of that scheme, as hereinafter provided, it shall not be lawful to register any person in the Medical Register in respect of a qualifying certificate granted in such division of the kingdom, unless such person shall first produce a diploma from one of the medical authorities in such division of the kingdom."

"Distinctions (in the Examination), such as may be judged proper between the cases of men and women," may be made. So, however, that the examinations of men and women be in all general respects equal" (sec. 15, line 25).

This proviso did not appear in any of the medical bills previously to 1878. In the first edition of the Lord President's Bill, it was worded as follows :—

"The examination rules shall provide for the admission of women . . with such distinctions, if any, as may be judged necessary . . so, however, that the examinations for men and for women shall guarantee equal proficiency."

In the second edition, this proviso (which gave to the examiners unlimited power to admit women on special terms) was changed to the following—

"The . . rules shall provide . . that the examiners may, if they deem it necessary, propose alternative questions to be answered by each candidate."

In the third edition of the Bill, the words were again, at the instance of the London College of Surgeons and Mr. Simon, altered again, and now stand—in the terms which we have quoted above.

The precedent established by this special exemption in favour of women is a very serious one, and it may well be doubted whether it is necessary that the law of perfect equality of examination ought to be broken through for the special behoof of the ladies. We should suppose that the making of any distinction in their examinations from those of men might be safely left to the feeling of individual examiners who would be responsible to the Medical Council (under sec. 17) for the fair exercise of that discretion.

### Homœopathy.

"The examination rules shall not require a candidate to (*pledge himself to*) adopt or refrain from adopting the practice of any particular theory of medicine or surgery. (Sec. 15, sub-sec. 2.)

"And if a medical board fail in their duty . . by requiring or making any attempt to require, a candidate to adopt or refrain from adopting any particular theory of medicine or surgery," it may be dismissed. (Sec. 17, line 40.)

It would seem that the words "pledge himself to" ought to be inserted where we have placed them, for it would be obviously impossible for a candidate to adopt

or refrain from adopting any line of practice before he had obtained his license.

The special provisions in favour of homœopathy are, we presume, inserted—as they were in the 23rd section of the Medical Act of 1858—in order to disarm the opposition of believers in that fanaticism. Those provisions are, however, ridiculous, inasmuch as they afford no real protection to homœopaths, and because no law could possibly be made which would prevent examiners from rejecting whom they pleased without assigning a cause.

We therefore consider that, though these clauses are wrong in principle and impossible of application, they are not worth the notice of the profession.

QUACKS' PENALTIES.

The 24th section is constructed for the purpose of preventing any and every conceivable form of misrepresentation respecting medical qualification, and seems quite comprehensive for this purpose. An additional subsection is added to the provisions of last year's Bill, providing that a person using "any combination of the designations or descriptions" the use of which is prohibited, shall be subject to the penalty. The Bill does not forbid an unqualified person to practise, but only to assume medical titles.

The Medical Council is endowed (sec. 24, page 14, line 28) with the power to prosecute quacks if they think fit, but no private person can so prosecute without their permission.

All fines levied upon convicted persons are to be handed over to the Medical Council (sec. 29).

The right of all persons—qualified or unqualified—to treat disease for gain is recognised in the Medical Act of 1848, and by custom, and when, last year, Dr. Lush's Bill proposed to prohibit counter-practice of druggists in England, the opposition to such proposal was so great that it had to be withdrawn. Without for a moment implying that the practice of incompetent persons for gain upon the lives and health of the people ought to be tolerated, or that Mr. Serjeant Simon's *protèges* the herbalists and bone-setters ought to be allowed to defraud the public, we must assume that the law recognises no crime in medical practice by anyone unless there be a misrepresentation on his part as to his qualification. In England the question is one of great importance, the competition between counter-prescribing druggists and dispensing general practitioners being close and severe.

There can be no good reason why—as provided by section 24—a medical man should be prevented availing himself of the law to protect himself against a quack until he has asked leave of the General Medical Council to do so. That body has hitherto avowed the opinion that it is none of its business to protect the profession against quacks, or to apply to them the law entrusted to it for use; and we do not think that it should be now permitted to prohibit those who are interested in the matter from availing themselves of the law. We think that in amendments to the Bill in detail, section 24 should be struck out altogether.

ERASURE OF NAMES FOR INFAMOUS CONDUCT.—"Where a registered person has, either before or after registration, been convicted . . of an offence which would be a felony or misdemeanour, or has been guilty of any infamous or disgraceful conduct in a professional respect," he shall be liable to have his name erased from the Register. (Sec. 12, line 13.)

"The name of any person shall not be erased . . on account of a conviction for an offence which . . does not, *either from the trivial nature* of the offence or from the circumstances under which it was committed, disqualify the person from practice."

The latter part of this section was introduced into the Bill for the first time last year, and ought, in our opinion, to be struck out. We do not understand how an offence "which would be a felony or misdemeanour," or which would be "infamous or disgraceful in a professional respect" can be, at the same time, "of a trivial nature;" and we think that the Medical Council, if empowered to gloss over the guilt of medical practitioners, will certainly shirk the responsibility of disbarring them, and we shall have the Medical Register defiled by the presence of many names of such persons. It is certainly an anomaly that the Medical Council should sit to decide whether an act, in respect of which a jury has convicted a delinquent for felony, is or is not a "trivial offence."

*(To be continued.)*

# Notes on Current Topics.

## Epidemic Diseases.

THE cases to which our correspondent, Dr. J. Birchenall, has called our attention should be particularly interesting to those who are engaged in the study of epidemic diseases. We quite agree with him in concluding that the cases of cholera and of relapsing fever show that new epidemic diseases often first appear in a sporadic form, and do not seem to follow the usual laws of epidemic complaints. This is the case not only with cholera but with other pestilential maladies; for even the plague, which has recently attracted so much notice, has on several occasions first manifested itself by a few isolated cases occurring at some distance of time or of place from each other, and the origin of which could not be well accounted for. Apart from the present question, we cannot help noticing the very judicious treatment to which our correspondent submitted his patient who suffered from an attack of cerebral congestion brought on by exposure to the sun. Few practitioners now-a-days would have ventured to apply a few leeches, so great are our prejudices against blood-letting; but to take ten or twelve ounces of blood from the arm would seem to most medical men of the present day almost criminal. There are many cases in which a little acute treatment will cut short, or ward off, much serious mischief; and perhaps blue-pill, black-draught, calomel, and antimony are in many instances as injudiciously neglected, as they were formerly indiscriminately resorted to.

## The Miners' Hospital, Redruth.

MR. ROBERT J. HUDSON has very properly called the attention of his fellow-parishioners to the great want of economy observed in the management of this useful hospital. He especially points out the large cost per bed, the large consumption of meat, and the want of proper dietary tables. It appears that the expenses were as high as £72 per bed in 1878, and £75 in 1877; that while the weekly food-expenditure per inmate in various London and provincial hospitals averages about 6s., at Redruth it is as

much as 11s. 3d.; and that the actual consumption of meat per inmate is about ten pounds weekly. After making ample allowances for cooking and for bone, the daily average rations of dressed meat for every man, woman, and child is as much as fourteen ounces, or more than double the amount consumed at any other hospital. Dr. Edward Smith, as Dr. Hudson points out, in his dietary for hospitals in the country, "doubted much if more than four ounces of cooked meat without bone ought to be given to men, or more than three ounces to women." We quite agree with Dr. Edward Smith and Dr. Hudson, "that too much meat is given in many hospital and prison dietaries considering the healthfulness, vigour, and duration of life of the agricultural population living almost without it." These observations apply also to a large number of patients under treatment at our urban hospitals. For not only is too much meat frequently given to patients who have perhaps never been in the habit of tasting it more than once a week, but it is given at a time when their enforced rest necessitates but a very limited supply of animal food. In the words of Dr. Hudson, "as the wants of the organism are lessened by the diminished work required of it, so the food should be of low nutritive value if it is to be properly digested and assimilated." The fact is, the regulation of our hospital dietary tables should be made a little more elastic than it is, and modified more in conformity with the previous habits and diet of the patients. To give a lot of animal food to paupers who have never been accustomed to it, and who have been suddenly compelled to change their life of labour and exposure for the rest and other comforts of a hospital ward, is no kindness to the patients themselves, while it is a piece of injustice to the ratepayers or governors that help to support them.

## Drug Contracts for Irish Workhouses.

We exposed some months ago the disgraceful system of drug contracts in Ireland which has existed for some years under the patronage of the Irish Local Government Board, and by which the tax-payers are not uncommonly cheated of the money and the sick poor of their medicine. We arraigned the system of contracting for union drugs as being, to a greater or less extent, habitually dishonest, and we challenged the Irish Local Government Board with knowing it to be so and yet permitting the system to continue. We are conscious that the words we then used and are now using, involve serious accusations, but we use them advisedly, because what we have said, though notorious to those acquainted with the matter, is not generally known or appreciated amongst the public, and we could not truthfully describe the system in any other terms. We cannot enter into details at present further than to quote a couple of excerpts from the Irish provincial press as illustrations—not of the abuses of the contract system, but of the happy-go-lucky style of drug supply to Irish workhouses.

At the Belfast Board of Guardians recently—

Dr. Corry said it fell to his lot to go over the list of accounts for medicines supplied to the union. The items he examined were those that were not in accordance with the scale furnished by the board for medicines that were not estimated for. There appeared to be an extravagance in the way in which some medicines had been ordered. There was one particular medicine (sulphate of atropia) which was very expensive, and was estimated for at 2d. per grain, while the order given for that medicine was two ounces, amounting to £6. He ventured to say that £6 worth of sulphate of atropia was a sufficient quantity to last for the next thirty or forty years. (Laughter.) If other medicines were similarly ordered he did not wonder at the magnitude of the account. He thought that whoever ordered the medicines should be a person who understood the prices to be paid. The resident physician told him that he was not furnished with any list of the prices for the various articles, which he (Dr. Corry) thought was a gross mistake. If the system of the central depot such as had been suggested were adopted, where medicines could be taken in a crude state, and tinctures, pills, and different preparations made, he believed they would effect a saving of 50 per cent.

At a meeting of the Limerick Dispensary Committee Dr. O'Connor, one of the medical officers, complained that the dispensary apothecary, Mr. Lee, had not compounded his prescriptions according to the instructions, that several ingredients were not put into the mixture, and that the medicines were deficient in quantity. For instance—ordered a cough mixture for an old woman. When he visited her again she was livid in the face, and was, in fact, in a very dangerous condition. She said his mixture had done no good whatever. He (Dr. O'Connor) examined the contents with Dr. Brooke, and found them to consist only of treacle and water, all the other ingredients which he had ordered were absent. Some months ago he remonstrated with the apothecary, and the latter promised there would be no further cause of complaint. All went on well for a time, but matters were now as bad as ever. Dr. Holmes made a similar complaint. Mr. Lee, in explanation, stated that he sometimes only gave half the medicines ordered for the purpose of husbanding his resources—for economy. Latterly there was a great run on drugs, and in the hurry he might make a mistake as to the quantity of the ingredients, but he always endeavoured to faithfully carry out the instructions of the medical officers. He heard of persons who fried fish with the cod-liver oil which they got at the dispensary. The Chairman said he heard that people used to feed their pigs with linseed, on account of their getting it in large quantities. Mr. Lee was informed that he should be more careful in the discharge of his duties in future.

The explanation of the tolerance of the frauds here exposed will be found in the following extract from the proceedings of the Naas Guardians:—

MEDICINE CONTRACT.

After an *exhaustive and careful analysis* made by Mr. Driver, it was found that Messrs. ———'s prices were lowest, and they were accordingly declared contractors. The unsuccessful offers were from Messrs. Hunt and Boileau & Boyd.

Mr. Driver, it may be stated, is a cotter farmer, whose conception of medicine may be presumed to be derived from the "dispensing" of a horse-ball or the administration of "the widow Welch's" pills. It would be interesting, if we were in a position to analyse the tenders of Messrs. ———, and find out by what commercial process they managed to undersell every other house in the drug trade.

---

The adulteration of annatto, which everyone knows is largely used for colouring butter, has formed the subject of a trial at Northwich under the Sale of Foods and Drugs Act. The adulterator got off because the public analyst found it impossible to prove that annato was either a food or a drug, and the magistrates, therefore, dismissed the case.

## Apothecaries' Weight.

At a recent meeting of the Pharmaceutical Society of London a letter was read from the Standards Department of the Board of Trade calling the attention of the Society to the 20th clause of the Weights and Measures Act.

"Clause 20 of the Act provides that drugs when sold by retail may be sold by apothecaries' weight. There is in the Act no definition of apothecaries' weight, nor in reference to the operation of clauses 8 and 24, are any Board of Trade standards of such weight provided under the Act.

"The Board of Trade asked to be informed what at the present day is apothecaries' weight, what are the several denominations of weights now used by apothecaries in retail trade, and whether or how far in practice they now differ from avoirdupois weight."

In reply to this communication, the council of the Society replied, giving the usual denominations of apothecaries' weight from 1 grain to 1 pound of 12 ounces, and asking that an explanatory deputation might be received. In addition the council forwarded a memorandum addressed to the Board of Trade, from which the following is extracted :—

"It will be observed that the pound of the apothecaries' weight, 12 ounces, is not put down in the foregoing table.

"This is purposely omitted for two reasons, firstly, it is not used, secondly, to prevent confusion.

"Although the troy and apothecaries' ounce are equivalent, it must be observed that section 20 especially limits the articles which may be sold by troy weight, and states the weight which may be used for drugs. Hence the necessity for separate description and verification.

"The measures used by chemists must be of glass, and unlike metal measures are not filled to the brim, answering for one quantity only, but are graduated in many subdivisions.

"It is of course for the Board of Trade to say whether all these minute graduations shall be verified, but seeing that the necessity for them arises more in compounding medicines than in selling liquid drugs unmixed, commercially, it may scarcely be important to do so."

## Residences of Dispensary Medical Officers and Dispensary Houses.

The following circular letter has been issued by Mr. Bruen, M.P., for Carlow, to each dispensary medical officer in Ireland

20th February, 1879.

Sir,—Having been informed that in many of the dispensary districts in Ireland the only buildings available for dispensary houses, and for the dwelling-houses of the medical officers, are so bad as to be utterly unfit for the storage of medicines, or for the habitation of gentlemen of education and civilised habits, I have, with the sanction and assistance of the late Mr. McCarthy Downing, Mr. Mullholland, and Dr. Ward prepared and brought in a Bill, which I hope will give facilities for providing an improved class of houses for the purposes I have mentioned in those districts, by enabling owners of land or boards of guardians to obtain advances of money at a low rate of interest, for the erection or improvement of such buildings under the provisions of the Land Improvement Acts.

It will be necessary for me to produce facts and figures, in order to prove to the House of Commons the necessity for the proposed legislation, and if in your dispensary district you find the house accommodation, either for the dispensary or for your own dwelling, to be seriously deficient, I shall be obliged if you will let me know the facts of the case, also whether it is impossible to obtain better houses.

Please direct your letters to me at the House of Commons, London.

I remain, yours faithfully,
Henry Bruen, M.P.

To the Medical Officer of the
Dispensary District.

Mr. Bruen's effort to have proper accommodation provided as dwellings for the dispensary medical officers, and as dispensaries, is most praiseworthy, and we hope the information he asks for, will be promptly afforded, to enable him to put forward the required statement in the House of Commons.

Many of the dispensary houses in Ireland are as utterly unfit for the storage of medicines as they are for the temporary habitation, while prescribing for patients, of gentlemen of education and civilised habits; the testimony of the medical officers will doubtless be corroborated by the L.G.B. Inspectors. There are many districts, too, in which the medical officers cannot procure suitable dwelling houses for themselves within their districts as required by the regulations of the L.G.B. If Mr. Bruen's Bill become law, not only will the utterly unfit places now used as dispensary stations be abolished and suitable places substituted, but also in districts where there is not at present proper house accommodation for the medical officers, will such be provided, doubtless on satisfactory terms and at a more moderate rent than the other medical officers have now to pay for houses which, in too many instances are not conveniently situated for the public and private practice of the district.

All the points of the proposed Bill will, as a matter of course, be carefully considered by the Irish Medical Association, and any defects which may be found in it will be pointed out to Mr. Bruen, and if necessary further action will be taken to ensure its provisions being made satisfactory in all respects. So far as the principle of this Bill is concerned, it appears thoroughly good and worthy of support, but its provisions will require careful consideration by those who are entrusted with the duty of guarding the interests of the dispensary medical officers.

## The Olfactory Apparatus.

It is familiarly known that no definite and satisfactory information is to be found in our text-books on the origin and relations of the parts of the olfactory apparatus. Whether the olfactory nerves should be taken as the first of the cranial series, or be considered as differing from all these in embryological and morphological detail, the actual morphological nature of the Schneiderian membrane—the real import to be attached to the nasal cleft—all have been to the present vexed questions in anatomy. By a paper read very recently before the Royal Society, containing the results attained to by Dr. A. M. Marshall, after an exhaustive study, much light is thrown upon the subject, and very valuable information afforded to the student. The gist of the work may be summed up in a sentence contained in it, which declares that "The olfactory organ is a visceral cleft; the olfactory nerve is the segmental nerve supplying the cleft in a manner precisely similar to that in which the hinder clefts are supplied by their respective nerves; and that the Schneiderian folds are gills." These conclusions are adequately sup-

ported by explanatory details of observations conducted on a long series of vertebrate embryos, and we may reasonably accept the proposition that "as there are no nerves or clefts in front of the olfactory segment, the olfactory nerve must be taken as the most anterior nerve, and the nose as the most anterior (visceral) cleft." The study of homologies is in itself so fascinating, and being so, calculated to lead the observer to formulate extravagant hypotheses, founded on his observations, that there is, rightly, a certain unwillingness to accept new explanations always apparent. But these results of Dr. Marshall's work derive such material support from the carefully arranged anatomical and developmental details, that they may be safely accepted as the rational explanation of that they seek to make clear. The paper is an important contribution to anatomical literature.

## Chloral in Migraine.

Dr. Seure, in the *Bull. de Therapeutique*, strongly recommends the administration of chloral in an enema, on the occurrence of the paroxysms of migraine, having found it almost infallible, and exempt from the disadvantages attendant on other modes of giving this substance, and far preferable to the employment of morphia, quinine, &c., for the same purpose. He gives, according to the sex or robustness of the patient, from one and a-half to three grammes, in a glass of tepid water, the effect of the chloral being rendered still more prompt by the addition of a tablespoonful of brandy. If a sense of burning in the rectum is excited this may be prevented by adding the yolk of an egg, or substituting tepid milk for the water. When, as in some persons, there is difficulty in retaining the enema, the quantity of the liquid may be diminished, and a drop or two of laudanum added.

## The Vicissitudes of Medical Journalism.

The Index to Medical Literature recently issued by Dr. Billings for the United States Government contains, as we learn from the *Chicago Medical Journal*, the titles of 247 American medical periodicals. Of these, in ten cases only one number was issued; in twenty-one cases the first volume was never completed; in sixty-one cases there was no survival beyond the first volume; in thirty-nine there was no survival beyond the second volume; and but fifty-three journals of the entire number are now current. The *Chicago Journal* says:—"Having carefully perused the list of the fifty-three surviving journals, and deliberately concludes that but from fourteen to twenty are of any permanent value to the profession, and worthy of general circulation, or to be sent abroad, and handed down to posterity as fit exponents of American medical periodical literature."

## The Herbalists and their Parliamentary Apologists.

The remarks which Mr. Serjeant Simon and Mr. Burt recently made in the House of Commons in defence of herbalists and other irregular practitioners were scarcely worthy of educated gentlemen, much less of men holding a responsible position. Mr. Simon may, as he confessed, prefer "going to the herbalist for natural medicines instead of being dosed with mineral poisons;" but he is much mistaken in thinking that there are many of his opinion, or that "a large number of the working-classes had as little faith as he in the medical profession." He assured the House that the herbalists were to be "trusted," as if the House were at all likely to be guided by such an assurance! Sir J. M'Kenna drew a just comparison when he likened the present faith in herbalists to the old faith in witches. And as far as the public are concerned, so far are they from having "little faith in the medical profession" that hospital physicians, and dispensary doctors, and poor-law medical officers, and private practitioners are too often overwhelmed with the multitude of patients who apply to them for their advice. Besides, the observations of these gentlemen were quite uncalled for, inasmuch as neither was Dr. Lush's Bill at all likely to receive the sanction of Parliament, nor would any English Government ever think of prohibiting these irregular practitioners plying their calling, or seek to deprive the public of their right to consult them if they felt so disposed. There is, as one of our lay contemporaries observes, "no legal obligation to consult registered medical men, nor does any penalty fall on a charlatan if, when his services are requested, he gives them to those that consult him." The weak point of Dr. Lush's Bill, which was otherwise a good one, consisted in its attempt to prohibit anybody but a registered medical man giving advice, administering medicines, &c. It is, however, evident that quackery and imposture have a good many patrons among the higher ranks of the community. A short time ago we had an eminent lawyer defending the practice of homœopathy, and now we have gentlemen of the House of Commons advising honourable members to put their trust in herbalists and bone-setters.

## Death of an Apothecary guessed to have been Poisoned.

At an inquest held on the remains of the late Mr. John Joseph Furlong, apothecary and pharmaceutical chemist, Homan's Hall, George's Street, Limerick, Dr. Parker deposed, "I have known the deceased intimately for nearly three years. During the past year his habits underwent a remarkable change; he became very gloomy and silent. I spoke to him very often about it, and tried to cheer him up, but all to no avail. The last time I saw him alone was on last Saturday, when he sent for me to consult me on a matter of business. Although capable of transacting his business, he was still sadly melancholy. I next saw him on Wednesday morning dead." A verdict of death from poison when in an unsound mind, was recorded.

Here is the evidence which convinced the intelligent jury, and satisfied the astute coroner: The doctor swears he was lying on his back. "I examined his body very carefully, first as to the state of his eyes, which were closed, but on elevating them there was a remarkable glistening appearance of the eyes, which I had never seen before in any case of natural death. In addition, the pupils were enormously dilated. The muscles of his body were entirely placid, and the right side of his body was maculated all over. *These four points evidenced that it was a clear case of poisoning.* I made an examination of the room, and could see nothing but a bottle of porter. At a subsequent part of the day a two-ounce phial was

found, containin, a small quantity of fluid. This fluid was composed of prussic acid and cyanide of potassium. I dipped my finger into it and touched my tongue with the fluid, and I had four hours of intense headache."

We have here an interesting contribution to forensic medicine. No longer will poisoning be doubtful, for we have only to look for the "glistening appearance of eye, the placid muscles, and the maculated" side, and the diagnosis is complete.

To speak seriously, it is an utter farce to return a verdict upon such evidence, neither a post-mortem examination nor a proper analysis of the contents of the bottle having been made.

## The Moderate Use of Alcohol.

WE thought that the alcohol question was pretty well used up, but we find that the first paper in the current number of the *Practitioner* is devoted to a few remarks on the subject from the pen of Dr. Dyce Duckworth. The author takes a very rational and temperate view of the matter, and such as we advocated from the very commencement of the discussion. He remarks that the experience of the majority of hard-working lawyers and physicians, would go to prove that a moderate indulgence in mild alcoholic stimulants is "both agreeable and beneficial, agreeable to the sensuous gratification of the palate (a perfect legitimate one, be it remarked), and beneficial for the distinctly better promotion of digestion." Still better, he says, we have not yet had laid before us the disadvantages of water-drinking. "Not to quote my own experience only, but that of others; it may be stated that taken late in the day, digestion is not comfortably completed when a pint or more of water is added to the meal . . . the large ingestion of solid food (an indubitable fact) and of cold water, as practised by teetotalers, cannot be considered in accordance with gastronomise laws." We quite agree with Dr. Duckworth, and could cite two or three instances in which the adoption of teetotalism has been actually injurious to the health.

## The Counter-Prescriber's Protection.

THE 20th clause of the Apothecaries Act, under which counter-prescribers have been hitherto prosecuted, is proposed to be repealed by the Lord President's Bill. We earnestly trust that the Defence Associations and the apothecaries will be sufficiently zealous and influential to prevent its being done.
